I saw an article in your last issue from the pen of Seth Green, in relation to the quantity of young fry necessary to put into a pond of from two to three acres to stock it suitably. I would say to all new beginners in trout culture not to begin with a less quantity in a pond of that dimensions than Mr. Green advises. Having a pond of about that size, and being already well stocked with the common brook trout, I was desirous of experimenting with the celebrated Rangely trout, so called. If had long been familiar with them in their natural waters, and had become impressed with the idea that the constitutional characteristics of those famous fish would be imparted to their offspring, and serve to increase the size of the trout in my pond. I therefore procured permission from our Commissioner of Fisheries to take spawn from the trout in the Rangely Lakes, by complying with the conditions of returning 25 per cent. of the offspring to the lake. I took 50,000 eggs and successfully hatched them, and turned them out in the small spring streams flowing into the pond. This experiment I made four years ago this coming spring, and I have to say that the result has exceeded my most sanguine expectations.

The small fry from the Rangely trout, at six months and one year from the time of hatching, were uniformly about double the size of the common brook trout; and in fact my impressions of them have been more than verified, and I firmly believe that let any unprejudiced man engaged in fish culture try both side by side with good chances for observation, and he will be satisfied with the result. As the result of my experiment I now have a pond of about three acres, well stocked with trout, weighing from one-quarter lb. to three lbs., and offering as fine a chance to throw the fly as the most ardent lover of the sport could wish; and in closing I would say to any one having waters of equal size, fed by good living spring streams, to follow Mr. Green's instructions, and they will be pleased with the result. G. O. HAYFORD.

Supt. Rangely Trout Breeding Association.

This is important information, for which fish growers will feel thankful.—ED.]

BLACK BASS IN WINTER.

MINNEAPOLIS, Minn., March 5th, 1876.

EDITOR FOREST AND STREAM:—

In FOREST AND STREAM for December 23d, 1875, is an article taken from another paper, entitled "The Bass Question," in which it is said. "They (the bass) are a summer fish, and it is doubtful if they feed at all in winter; they probably hybernate." This certainly does not apply in this region. It is no very unusual occurrence for winter fishing parties to return from lakes in this vicinity with several black bass among the catch. To personally test the question, I yesterday visited a lake which I knew from summer experience to be well stocked with bass. With four lines, in a short time, fourteen fine black bass were landed on the ice, and many profitless bites were had. If more lines had been set a large number of fish would undoubtedly have been caught, but, as the ice was two feet thick, it required no little labor to open holes. The bait used was live minnows. In the stomachs of several of the bass I found craw-fish, showing that their summer propensities for this kind of food still prevailed. By yesterday's experience, and various well-authenticated reports that I have heard during the past winter, I am fully convinced that the black bass does not leave off feeding and hybernate during the *winter* season in Minnesota. THOMAS S. ROBERTS.

The Kennel.

THE KENNEL REGISTER.—We have received, and responded to, applications for three hundred pedigree blanks, which looks as though the Kennel Register would be a bulky volume. There are still plenty of the blanks left and gentlemen proposing to register their dogs will find them of great assistance, as it is only necessary to fill in the names. No other form of application is necessary.

OUR PORTRAIT GALLERY.—It was rather a happy idea, that of re-producing in a handsome form and all ready for framing, the portraits of the celebrated dogs which have from time to time illustrated our pages. It makes a very handsome collection and we shall soon commence a new series. The set of eight pictures, together with the engraving of our Chicago cup mounted to correspond are sent for $2.

KEEP THE KENNEL CLEAN.—A correspondent writes: "Tell our sporting friends to keep the dust cleaned out of their dogs kennels. There is a good deal of hard sneezing done, and bad health brought on dogs by their being chained up and made to breathe the dry and poisonous dust deposited in their kennels from filth and mud off the dog when loose for hunting or exercise; if the dog has only boards to lay on, wash them clean frequently.

HIGH POINTING.—A correspondent who read the letter of W. G. H., in our issue of the 9th inst., regarding his dog pointing three quails in a tree, sends us an account of his own dog, who, while hunting woodcock remained persistently on a point, although no birds could be flushed. He at last discovered a nest in a tree some feet above the ground in which were several young birds; although he does not say what kind of birds they were. The dog was a fine setter named Frank, whose photo is now before us.

MORE LAVERACKS.—The Steamer City of Chester landed at this port on Monday morning two pure Laverack setters, a dog and a gyp, imported by Mr. Chas. H. Raymond for Mr. Chas. S. Westcott, of Philadelphia. The dog, Pedigree, is orange and white, very fine in coat and showing strongly the distinctive marks of the Laverack strain. The Gyp, Magnet, is a blue Belton. Both are by Baily's Victor, out of Mr. Laverack's Blue Daisy.

THE NATIONAL POINTER AND SETTER FIELD TRIALS FOR 1876.—Through the kindness of Samuel Ebrall, Esq., Secretary, we are advised that these important English Field Trials will be, by permission of the Rev. J. D. Corbet, held on the Sundorne Estate, near Shrewsbury on the 25th and 26th April. We are assured that should any American sportsmen attend the meeting with their dogs they will meet with a warm welcome.

—One of the interesting features of the approaching Springfield Bench Show will be an exhibition of trick dogs, as tending to show to what extent a dog's education may be carried. Two prizes are offered, a solid gold medal for the best dog, and a silver one for the next in merit. "Guess," a brindled bull-terrier carried off the honors without competition last year, and we trust to see an active opposition to his repeating the trick on this occasion. Not but that Guess is a remarkable dog, but we want to see more of them.

—Mr. C. Herman Raymond, who resides at the Grand Hotel in this city, and Mr. S. H. Creed, President of the Rod and Rifle Association of Jamaica, L. I., have a kennel at Mr. Creed's residence, at Jamaica. They have recently received by the steamer Auchoria from Glasgow, a pair of high-bred cocker spaniels, a dog and gyp, Sam and Countess. Before leaving, Countess was served by the cocker Duke, winner of first prize at the last Edinburgh bench show, and has since littered. They also received by same steamer a pair of Gordon's, black-and-tan, named Carlo and Juno, from one of the largest estates of Scotland.

—The imported Irish setter bitch Kitty, visited her sire Plunket, on the 17th and 18th of March.

A CENTENNIAL BENCH SHOW.

Mr. Burnet Landreth, Chief of the Bureau of Agriculture, has issued a circular announcing a Bench Show to be held in the Centennial buildings in September next. For the benefit of sportsmen who may desire to know the conditions upon which they can exhibit their dogs we print it in full:—

The Centennial Commission has provided for a Bench Show of sporting and non-sporting dogs, to be held in conjunction with the International exhibition of horses, commencing Sept. 1st and continuing for eight days. Benches will be furnished free of charge. Exhibitors may themselves assume the cost of attendance upon their animals, but to provide for those who cannot conveniently attend the exhibition, the Commission will assume the expenses of feeding and daily care, upon the payment of an attendance charge of three dollars upon each animal.

Numbers alone will distinguish dogs in the show yard preceding the award of prizes.

Transportation and terminal charges must all be paid in advance, or the Commission will not receive consignments. Full information relative to transportation will be furnished upon application.

All specimens must be actually the property of the exhibitor, and only those will be admitted which possess unmistakeable signs of merit.

Each dog must be provided with a substantial collar, and four feet of chain of a strength sufficient to hold him. Dogs may be sold at private sale at any time during their exhibition, but no dog, to the event of being sold, will be allowed to be removed prior to the 9th of September.

The veterinary surgeon of the Commission will inspect every dog before admission, and will examine the stock daily to guard against infection. When animals are taken sick, the exhibitors may direct the treatment themselves, or allow the veterinary surgeon to treat the case.

Dogs will be exhibited in the prize ring before the judges, and at such other times as may be considered expedient by the Chief of Bureau, either for display or exercise.

Special premiums from societies and individuals must be awarded through the hands of the Centennial Commission. Entries are now being made, and will be in order till 1st July. Forms of application for space may be had by applying to the Bureau of Agriculture.

IRISH SETTERS.

BILLALOE, Clare county, Ireland, March 6th, 1876.

EDITOR FOREST AND STREAM:—

As a breeder and great admirer for more than twenty years of Irish setters, perhaps you will kindly allow me to venture a word on the above subject.

My experience has always been that the only pure breeds of Irish setters are the all red, red and white (which latter means red with white facings), and the spotted red and white. In this I am fully borne out by "Stonehenge," the greatest of European authorities on the dog. No doubt you will occasionally find here and there about the island, so called Irish setters with black, and even black and white coats. These are mongrels simply, *et preterea nihil*. They are, generally speaking, the result of a cross between the Irish red setter and the Scotch Gordon, red setter and pointer, and even between the former and either the liver or black and tan retriever.

With regard to the colors mentioned by the late ever to be lamented "Frank Forester," as cited by "Georgia," *viz:* yellow, and orange and white, I have not the least doubt on my mind that he employed these terms merely as other names for red—the light or *yellow* red one so often met with now-a-days. The same remark applies to the other distinguished scholar and sportsman referred to by your correspondent—my friend the Prince de Viseos ("Old Calobar")—who, like poor Frank, has, I am truly sorry to say, also passed from time to eternity. I knew the Prince's red Irish setter dog Index very well, having, in company with his royal master, shot over him on an Irish moor in 1868. He was a fine upstanding animal and a stylish ranger, but had not the deep red color now so much in vogue; and in speaking of him as being in color chestnut, I am only too positive that the Prince used the word only to describe the particular shade of red in his strain. Truth is, very few Englishmen understand thoroughly the Irish setter. For example, at the Dublin Dog Show, held last week, which I attended from the opening to its close, the English judges gave the three principal prizes in the Irish setter classes to animals that were literally daubed with white on head, chest, belly, toes, and even tip of tail, and boasting withal red or flesh noses, and light eyes! Certainly many of the red and white dogs are quite as good in every respect and as well bred as the all red; but in awarding the prizes as they have done, they have ignored most of the recent decisions of other exhibitions where red was the winning color.

S. J. HURLEY.

BALTIMORE, March 11th, 1876.

EDITOR FOREST AND STREAM:—

Your correspondent "Warwick" (replying to "Nimrod") in your last issue writes a strong article to prove that Irish setters in their purity are of other colors than red, and red and white. In the course of the article, to sustain his argument, he says: "As short time since a gentleman imported a blood red Irish setter from a celebrated kennel in Ireland. Upon his arrival in this country he was pronounced the finest specimen of the above mentioned breed that had up to that time been imported; the only objection being that he was undersized." The owner of that dog is not aware, I suppose, that not many years since a black dog from Scotland was introduced into the above kennel. Now, such being the case, according to your correspondent's ("Nimrod") theory the red pups of the litter would be the pure article, and the black ones would be entirely ignored. In regard to this, I for one must say that I think the blacks should be ignored *in toto*, and I regard as conclusive the reason I give, though others may think differently: Some years since I had a fine setter bitch, (white and orange), and by accident the first time she was in season she was served by a brindle bulldog, of which litter all the pups were destroyed. When in season again she was kept up without service until it had passed; after that she was served by first-class setter dogs, and in five or six litters since whelped she has always dropped one or more brindle bull pups. Now I should like to ask "Warwick" (assuming for sake of argument that the bitch was thoroughbred Irish) whether those brindle pups were bulldogs or Irish setters? I have known several instances of a similar character occurring between setters and pointers; where a setter bitch had been served the first time by a pointer dog, and, although served by setters afterwards, in every succeeding litter one or more pointer pups have been whelped, and *vice versa* when a pointer bitch had been served by a setter dog.

EDGE TOOL.

WARTS AND DISTEMPER.

ST. PETERSBURG, Pa., March 21st, 1876.

EDITOR FOREST AND STREAM:—

In your paper of March 6th, J. W., of Charlotte, Mich., asks how he will get rid of those warty excrescences in his pup's mouth. In answer to his inquiry, nitrate of silver will destroy the growths. He can procure the stick caustic in any drug store. Apply to a few of the growths at one time, and keep the dog's mouth open for a little time after to give the caustic time to act. Some of the warts may require a renewal of the application.

For distemper, chlorote of potash in drachm doses. Give night and morning, with castor oil, if costive. I saved a fine Irish setter bitch with this treatment, after all other remedies had failed. She had running sores on back and haunches, and was totally unable to move. I have saved many fine dogs by the same treatment. I have dissected several cases that have died of this disease, and found in all more or less engorgement of the lungs, and in many cases the lung substance has undergone a change from the inflammation, and I think that in all cases of distemper, unless very slight, the bronchi and lung substance suffer more or less. I would like to hear from some other of your many readers in reference to this subject. W. E. B., M. D.

[Our correspondent will find in our issue of 16th inst. a letter on this subject from Dr. W. S. Webb, of this city.—Ed.]

THE COLOR OF FIELD TRIAL SETTER ROCK.

BOSTON, Mass., March 20th, 1876.

EDITOR FOREST AND STREAM:—

In Mr. Burges' "American Kennel and Sporting Field," just published, I notice an error in regard to Mr. Luther Adams' Rock, both in the text under the picture, and also in the full pedigree, *viz:* The color is given as *liver* and white, while as a matter of fact the grand old dog possesses the color which Stonehenge names and, *Me judice*, justly, as first in order of merit, *lemon* and white. He may not be a better dog for his color, but some of us prefer it. Mr. Adams may be very much pleased at the error for aught I know, but, as Lord Eldon says, "I doubt." UNDER GRIP.

DR. WEBB'S REMEDY FOR DISTEMPER.

BRAINERD, March 24th, 1876.

EDITOR FOREST AND STREAM:—

You may say to your readers for me that Dr. Webb's remedy for pneumonia in dogs is worth to any one, five, yes ten times the price of the FOREST AND STREAM. I had a fine pointer gyp, almost done for with the disease when the paper came; commenced treating her according to the Dr's. teaching, and to-day she is well as ever. So much for the common sense remedy. THOS. P. CANTWELL.

KENNEL PRODUCE.—At Morristown, N. J., on Thursday last, Mr. E. M. Quinby's setter Nelly dropped eight whelps. Their sire, Glen, is by Shipman's famous Joe, out of Mr. Foote's Nelly, and the entire litter, like their parents, are white with orange markings.

Sea and River Fishing.

FISH IN SEASON IN APRIL.

Brook Trout, *Salmo Fontinalis*. Land-locked Salmon, *Salmo Glaveri*.

☞ For list of seasonable trout flies for April see our issue of March 23d.

FISH IN MARKET.—Owing to the severe storms that have prevailed during the past week fish have been scarce. Trout are in light demand; the Long Island fish which usually sell at $1.25 per pound are now retailing for $1. Canada brook trout bring 50 cents per pound; Wisconsin trout, 25 cents, and brook trout from Moosehead Lake, 75 cents. Some very large rock bass, weighing from 50 to 75 pounds each, have been received from Norfolk, Va. A car load of fresh California salmon, from the fisheries of A. Booth on the Sacramento River, arrived this morning. Our quotations are: Striped bass, from North Carolina, 16 to 20 cents per pound, according to size; smelts, 15 cents; green do., 20 cents; salmon, 60 cents; mackerel, 25 cents each; shad, from North Carolina, 75 cents; a few shad have been received from the Potomac; white perch, 15 cents; Spanish mackerel, 50 cents; green turtle, 22 cents; terrapin, $15 per dozen; halibut, 18 cents per pound; haddock, 8 cents; king fish, 18 cents; codfish, 8 cents; blackfish, 16 cents; flounders, 10 cents; eels, 20 cents; lobsters, 10 cents; sheepshead, 30 cents; turbot, 25 cents; scollops, $1 per gallon; soft clams, 30 to 60 cents per 100; white fish, from Detroit; pickerel, 18 cents; pompano, $1; hard crabs, $4 per 100.

—Speckled trout we believe to be naturally in season from the 1st of January until the 1st of September, although there are few localities which they inhabit where the streams are sufficiently open to permit of their being taken until April 1st. While we are inclined to be governed by natural seasons, it is, perhaps, well to take away by proper legal restrictions, any temptation that may arise to take them through the ice in winter, or otherwise deplete their numbers by unsportsmanlike means. It may be regarded as fortunate that the weather seals up the waters with ice to assist the law-makers and aid the work of pre-

servation and replenishment. Trout can now be taken in Maine, New Hampshire, Massachusetts and Rhode Island, and also in New York and the Middle and Western States generally, and all parts of Canada except the Province of Ontario. In Ontario and Vermont fishing is prohibited until May 1st, and in Connecticut until April 15th.

—W. D. Chapman, of Theresa, N. Y., who is the inventor and maker of much fine trolling taekle, has sent for our inspection what he styles a trolling pole. It is a short bambno cane, with a loug line attached to it, and also to a movable steel harpoon. When an object is struck, either by throwing or thrusting, the harpoon detaches itself from the pole, but remains fast to the line. It is really an improvement upon the fish spears long in use by the Indians of the great lakes for fishing through the ice, as described in FOREST AND STREAM of January 27th, 1876.

—Messrs. Abbey & Imbrie, 48 Maiden lane (old stand of Andrew Clerk & Co.), have on exhibition one of their new braided split bamboo salmon rods, to which the attention of anglers is invited. It seems to be a very efficient implement.

—An old United States Army surgeon recalls some reminiscences of black bass fishing in Minnesota, not a dozen years ago. In 1869 we fished Big Lake, some eighteen miles from St. Paul, and caught bass without limit. The water seemed fairly to swarm with them. The writer says:

"On the 31st of May, 1864, the quartermaster, sutler and myself started in the afternoon with a six mule government team from Fort Ripley, Minnesota, to a lake seven miles west of the fort, called Windermere. We arrived late in the day, and only had time to pitch our tent, cook supper and take a smoke, when it was too dark to fish that day. The next morning we were up by daybreak and proceeded to catch frogs, which were very plenty about the shores of the lake. Having caught a sufficient number to begin with we commenced to fish. The sutler had an old bamboo rod about ten feet long, having had about six feet broken off from its end; besides, on the trip out, it had been broken through the middle, so that when the fish seized the bait the rod would squeak. The quartermaster and I both had very nice rods. After our boat had been paddled to the fishing place the lines were cast, when squeak went the sutler's pole and out came a black bass. Soon we were enabled to do the same thing, but the sutler caught about as many as both myself and the quartermaster. He was of the opinion that his luck depended upon his squeakey pole. Well, we continued to haul in the bass until called to breakfast, when, on counting, we had eighty bass, averaging four pounds each. After breakfast, while my companions were searching for frogs, I pushed the boat about 100 feet from the shore, where the water was ten feet deep, and threw in my line, which was immediately taken; on looking over the side of the boat I saw twenty bass gathered around the spot where the line had been cast, waiting for it to be thrown again. I continued to fish an hour, when I returned ashore exhausted. My companions then took the boat and fished until eleven A. M., when we loaded the fish which we had taken, which filled two pork harrels and one gunny sack. We only ceased fishing because we had more than we desired. This lake is one of the most beautiful sheets of water I ever saw. It is oval in shape and about six miles long by three miles at the widest part. In its centre is an island containing about three acres of land, forming a perfect shaped sugar loaf, which was covered with every kind of berries growing in the neighborhood. I have camped on this island, and it was with difficulty that the tent could be spread, owing to the ground rising so perpendicularly from the water's edge. The shores of the lake are bold and covered with a heavy growth of evergreens. The fishing did not require auy skill but simply to cast over the bait and pull it in.

I have visited this lake many times while stationed at Fort Ripley for the purpose of fishing. Although my efforts were always crowned with success, I never caught as many fish in so short a time.

By a little past mid-day we reached the fort, and the whole garrison of soldiers were supplied with fish. Occasionally we caught a pike, but these were returned to the water as unworthy the company of such fine fish as the black bass." HENRY MCMAHON, M. D.

MASSACHUSETTS—*New Bedford, March 25th.*—The close season for trouting has just ended, and several of our amateurs exhibit fine strings of "salters," that is, trout just leaving the salt water for the brooks, and caught at the mouths of the streams. Owing to the mildness of the past month herrings, smelts, &c., made an early appearance in our markets, but the cold weather of the past week has somewhat checked them. CONCHA.

—Capt. J. W. Coventry, owner of the Nouvelle River, district of Gaspe, Canada, says to us:—

"There is no river in the world to equal it for large fish. I think I have let it for this year to Sir John R. Reid, and some other English gentlemen, reserving a rod for myself. A man to fish the river properly must be strong, active, and used to a canoe, as it is the wildest place to kill large fish that I ever tried in my life. I am asking the English gentlemen £40 per rod. The trout fishing in this river is certainly first rate, the fish being of a very large size and superior flavor."

MOVEMENTS OF THE FISHING FLEET.—There have been but 19 arrivals of the fleet the past week, as follows: 13 from Georges, 5 from the Banks, and 1 from Newfoundland with herring. The Georgesmen return with light fares, and report cod-fish scarce for the season. They did not feel the full effects of the severe gale on Monday and Tuesday, which was indeed fortunate. The receipts of fish are 390,000 pounds Georges cod-fish, 13,000 pounds halibut, 295,000 pounds Bank halibut, and 200 barrels herring. Others of the Georges fleet are hourly expected. Sales of halibut at 6 and 3 cents per pound for white and gray. Round cod-fish for curing, $1.75 per hundred pounds.—*Cape Ann Advertiser, March 24th.*

THE SPLIT BAMBOO RODS.

ELK County, Pa., March 13th, 1876.

EDITOR FOREST AND STREAM:—

My attention has been drawn to an article in FOREST AND STREAM under date of March 9th, entitled "Split Bamboo Rods," which I think deserves more than a mere passing notice. As an old fly fisherman, and one who has been using the Krider rent and glued bamboo fly rod under almost every conceivable condition of tension and weather during the trout fishing seasons for a period of five years, often fishing side by side with gentlemen who used split bamboo rods with the enamel on the outside, and frequently using such rods myself, I have no hesitation whatever in giving it as my deliberate conviction, resulting from experience of many years, (whatever that may be worth) that the Krider rod is superior to all others that I have used or seen used, in all the essentials that constitute a first-class fly rod—which, as I take it, are: First—capability for sustaining a heavy strain. Second—elasticity and retension of its straightness without suffering any permanent set, even from constant usage. Third—its imperviousness to the action of water. Fourth—its lightness and durability.

The principle of the Krider rod is that of the spokes of a wheel, or something similar, except that they are extended throughout the entire length of the rod, bracing it from centre to circumference with the strongest and most elastic parts of the bamboo, the spaces between being filled up with a homogenous mass of fibre, the whole together representing a continuous length of spokes and tire. But as one of the fly-fishing fraternity, I think this question should be decided definitely by something besides printer's ink and types. Therefore, I propose that the Krider rod shall be tested with any and all other split bamboo rods not made on the same principle (equality of length, weight, and size being taken into consideration.) A. H. CLAY.

So far as mechanical execution is concerned, the qualities of competing rods can be determined with tolerable accuracy by fly-casting contests; but it would be difficult to judge satisfactorily of the respective merits of rods so far as relates to wear and tear, and invulnerability to the action of heat, cold, and dampness, and imperviousness to water. Rods that appear to have equal qualities when new, oftentimes develope a great difference in their staying powpowers within a very short period.

PHILADELPHIA, PA., March, 1876.

EDITOR FOREST AND STREAM:—

In your paper of March 16th I have read your very interesting and instructive remarks on the manufacture of split bamboo rods, and the difficulty experienced in obtaining good material for that purpose, which, as you truly remark, has established the reputation of the split bamboo fly rods. I have had no little experience for the past dozen years in the art of fitting up these delicate strips in every manner at present generally known, but it seems to be the opinion of some of your readers that in no manner can the bamboo be split and fitted up with success, except in using four or six strips with enamel on outside. I don't write for the purpose of finding fault with any rod maker's method of manufacture. I merely want to show that there have been other modes of working and fitting up bamboo, considered by many the most successful, when fitted in a skilful manner. I have reference to the centre enamel split bamboo manufactured by the well-known sportsman, John Krider, and in use for over ten years, having been tested by many of the best fly-fishers in all sorts of weather and waters with entire satisfaction.

In your issue of March 9th I noticed an article entitled "Split Bamboo." The writer objects to the Krider rod for the following four imaginary reasons He says, first: You must file off the enamel on each strip down to the fibre, so as to make the glue hold: second, in filing the sticks in a round, you must cut away a very considerable part of the strongest underlying the enamel; third, you expose to the elements the porous parts of the cane, while you close in that which is waterproof; fourth, in the use of the rod, the greatest strain being upon the outside, is put upon the weakest part of the material.

It needs very little argument to prove that the writer of the above objections understands very little of the important subject he ventures an opinion on. Now, in making a fine seven-ounce fly rod, over eleven feet, in three pieces of equal length, it certainly requires the strongest and most elastic material. I consider the middle joint for such a rod the most important, which is made on the centre enamel plan as follows: Get your bamboo the required length split in half; next split your strips —5-32 of an inch is wide enough—next heat and straighten; plane to gradually, tapering to lower end, which should be 3 32 of an inch. Now you have almost a four square strip. If you examine this strip, there is 3-32 of an inch of the toughest and most elastic part or enamel on the outside of the strip. Now, to fit up so as to get this part on the outside, as well as centre, is the great object, and is as follows: File the enamel side of your strip enough to make it fit properly; now plane off the sap or soft side V shape, so as to have enamel and soft sides go together; have eight strips of equal size, well fitted, so as to form a centre glue all at once; get perfectly straight before the glue sets; it has to be done quickly. After the glue has a reasonable time to harden, inclose your wrapping; plane or file off. You can then see you have eight lines of the most elastic part or enamel; run down your piece on the outside, as well as centre; and most undoubtedly you have as strong a piece as can possibly be made of the material, and you certainly have all the rich and varied shades of the natural grain all over the surface. W.

CANADIAN FISHING PRIVILEGES.

THE RESTIGOUCHE AND OTHER RIVERS.

DEE SIDE, METAPEDIA, P. Quebec, March 13th, 1876.

EDITOR FOREST AND STREAM:—

Having had inquiries from different parties in the States recently, requesting information about angling in this quarter, and as it is to be supposed all sportsmen read FOREST AND STREAM, may I give it to them through your columns?

There are seven miles of angling water here, *viz:* From head of tide water to Metapedia, open by orders of Marine and Fisheries Department, Ottawa, to strangers or others, by permit, at a rate of $1 per day per rod. At the principal pool called Metapedia, is a station on the Inter-Colonial Railway, 14 hours from St. John, N. B., and about 30 from Montreal. Eighty salmon, averaging 17½ pounds, were taken by anglers last season. At this spot is also a hotel, Mr. D. Fraser, proprietor; fare about $2 per day. Fishing commonly done from bark canoe or boat, principally manned by Indians; one man and canoe $2 per day, two men and canoe $3. Parties bringing their tent have every facility for camping on beautiful islands or beaches (riparian rights not acknowledged here). All common necessaries can be obtained at a village near, and the best of milk, eggs, butter, etc., from the farm houses on the river. On this portion of the river also, sea trout are in abundance (as well as salmon) from 25th June to 8th July, and are commonly caught by the settlers with salmon twine line, small codfish hook, and pork bait. Just think of that, ye disciples of old Walton. Of course they can be fished from shore, but as the river is large, unless you are prepared to follow a salmon with boat or canoe, you will soon part company. The Nouvelle River, opposite Dalhousie, a good trout stream, must be applied for to Department of Marine and Fisheries, Ottawa. Escuminac River, very large trout, is leased by Mr. Fraser, I believe, for accommodation of his guests. All other fisheries are owned by Sir Hugh Allen. C. J. Bridges, Sandford Fleming, and George Stephen, to whom all applications for permission to fish on these limits must be forwarded. The best of flies suitable for this river, as well as reliable leaders, made on the spot by Mr. John Baird, can be furnished, and all permits granted by me on application. JOHN MOWAT,

Fishery Officer, Restigouche Division.

Anglers, and especially residents of the United States, will feel grateful to those who have been instrumental in inducing the Canadian Government to place some of the best waters of the Dominion at their disposal at so reasonable a rate, and we know that much is due to Fishery officer Mowatt, to whom such persons as recognize their indebtedness should render thanks. Englishmen at home, who pay enormously for fishing privileges, would jump at the opportunity. "*One dollar per day!*" Why, some of the Long Island lessees of trout privileges demand $5 per day, and guarantee nothing. It is cheaper to go to the Restigouche for a fortnight, than to Long Island for an equal period. The opening of the Intercolonial Railroad now enables the angler to bring home his salmon in good order, and many a man who has never before hooked a salmon, will be proud to exhibit the trophies of his prowess, through the facilities of quick transportation at his command. We happen to know that several of our best anglers will visit the Restigouche River next season, and have reason to believe that all the rivers of the Gaspe Peninsula will receive more visitors than ever before. Dalhousie or Gaspe Basin, either, are most desirable headquarters.

SPARE THE FINGERLINGS.

BALTIMORE, Md., March, 1876.

EDITOR FOREST AND STREAM:—

The season of trout fishing is close upon us once more, and no doubt many, like myself, have been already putting tackle and eqalpments in order, and meditating what scenes of past pleasures they shall revisit, or casting about for fresh woods and pastures new. It is only sad to think that the wholesale destruction of small fry will go on as usual, under which, year after year, our streams, even in remote mountain regions and back woods, are so unnecessarily deteriorating. Can no sort of appeal be effectual in checking this suicidal practice?

Some time ago there appeared in your paper an account of two days' fishing among the White Hills, the score being 237 the first day, and but one less the next, many of them running up to ten inches in length, and speedy retribution followed in the shape of a mathematical demonstration by an indignant correspondent, that the "fine lot" could not have averaged much over one ounce, and the great majority of the fish must have fallen below that almost feather's weight. It is to be wished that every like pretentious report be exposed in the same style; but I fear that such fishermen will be thereby only deterred from publishing their exploits, not from repeating them. I desire to put the argument in a different way, by urging brother sportsmen to try the experiment of a little abstinence and restraint upon one's murderous propensities, and I am convinced that in a short time, not only will forbearance altogether cease to be felt as a disagreeable restraint, but there will be a positive pleasure in returning fingerlings to the water. Such has certainly been my own experience. My companion and myself came to an agreement upon this point several years ago, and have found an increasing satisfaction in adhering to it. Our rule is to keep none but the larger fish of the stream we may be on, letting the small fry go to grow up for some brother sportsmen, if not for ourselves. Sometimes we have thrown back as many as two or three hundred in a day. We have the measure notched on our rods, and in case of doubt it is only a few seconds work to lay the fish alongside, and if it fails to come up to the mark, it is dropped back into the water. Under all circumstances we are careful to take no more than can be immediately consumed, raising the standard, if necessary, to keep the weight within the consumption. Now, both of us were and are as eager as fishermen can be, and I am free to say that it cost us a little self-denial at first, but the habit soon became confirmed, and we now take greater satisfaction in releasing than it formerly was to keep. We quickly lost all senseless rivalry about the greatest number, and transferred our ambition to getting the heaviest weight.

The object of this communication, then, is to propose the reasonable rule that, no matter how the trout may run in any given stream, the largest fish only should be taken off, and so used a stream will be a joy forever; and secondly, to urge brothers of the rod to make the experiment, and see how soon they will come to find a positive pride and pleasure in practising such a rule; and let catch of weight be always reported, when practicable, in stead of mere numbers. H.

We regret to learn that Mr. Charles Vinten, of the St. George Cricket Club, has met with a severe accident, the result of a sudden attack of illness. In a letter from Mr. Satterthwaite that gentleman says:—

"You have probably not heard of the very sad accident which happened to our old friend and cricketer, Mr. Chas. Vinten, Treasurer for many years of the St. George's Cricket Club. Mr. Vinten had a paralytic stroke in his own house. Unfortunately, he was at the head of the basement stairs; he fell the whole flight, cutting himself badly and injured his spine. This misfortune occurred two weeks ago; since then Mr. Vinten has suffered greatly, and been unable to do little else but speak to make known his wishes. No one can tell whether he will recover or be bedridden for life."

Mr. Satterthwaite, in commenting on the Club prospects, says:—

"I find a very large balance in the bank, and freely state it is over what we have had at this time for many years; besides this, we have paid in part for the use of the ground this year. We look forward to an unusually fine and active season, and will, no doubt, have many visiting clubs on our grounds this summer. I understand the officers are to visit Philadelphia again, and we will have them, of course. I would not be astonished if an English team came out, which, of course, will make us a three days game. George Giles has been engaged for the season. The Club-house has been newly roofed and will soon be freshly painted. The ground is looking remarkably well—thanks to Giles—and the turf has been freely manured and tended. Our April meeting is on the 3d, to be held at Sutherland's, 74 Liberty street, at 4 P. M., when many new names will come up for election. Our new Secretary, Mr. David B. Gilbert, is taking great interest in the Club. His address is Soutter & Co., 74 Broadway, while mine is No. 10 Pine street, back office.

—The new rule of the amateur code referring to calling strikes is as follows:—

FAILING TO STRIKE AT FAIR BALLS.

SEC. 7. Should a batsman fail to strike at a ball sent in by the pitcher over the home base, and within the specified reach of the bat, the umpire shall call "one strike;" and when two such strikes have been called the umpire, on the delivery of the next fair ball, shall warn the striker that he will call the third strike on the next fair ball delivered, at which time the batsman must run to first base, as in the case of hitting a fair ball.

—The New Haven nine will play their first match with the Hartford Club on May 3—inauguration day—at Hartford. In the meantime they will practice with the Yale University nine.

—The grand hand ball and racket tournament is to commence at McQuade's Court, in this city, on April 17th. Players from Canada and all parts of the States will participate in it.

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

S. H. W., Washington.—Have replied to your letter by mail, but are uncertain as to the address.

G. H. W., Woonsocket, R. I.—Where can I get a good telescope for a Remington rifle, and what would be the cost of one? Ans. H. Waldstein, 545 Broadway; $10.

S. G. T., Erie, Pa.—Can obtain a copy of Porter's "Hawker on Shooting" by addressing J. S., St. Paul st., Baltimore, Md. We should say that about $4 would be a fair price.

J. W., Brooklyn.—I would like to know what a small centre-board yacht, about 22 feet long by 6 wide, would cost? Ans. If new, from $300 to $400; second-hand, $150 to $250.

YEARLY SUBSCRIBER.—Can you inform me if there is any kind of scented oil used to put on bait, to make fish bite? Ans. We have heard of asafœtida being used. Some anglers spit on their's.

A. B. COVERT, Ann Arbor, Mich.—The pamphlets of Dr. Cones are published by the Department of the Interior, and may be obtained there, or at the National Agency at Salem, Mass., or of the author.

SIGEL.—Will you inform me if there is, or was to your knowledge, a gunmaker by the name of W. H. Mills; if so, what his reputation was as a maker? Ans. We have never heard of a gunmaker of that name.

WILLETS.—We understand that N. M. Livingston, of Skaneateles, N. Y., is the inventor of one of the best spoons for deep trolling for lake trout. We have seen the spoon, but do not know where they are for sale. Address him.

BIDDLE, Phila.—We should think your stream favorable for trout. For fish to stock with, and all necessary information, address Milton F. Pierce, Wenona, Gloucester county, N. J., or Thompson & Tagg, New Hope, Bucks county, Pa.

D. W. B., Brazil, Ind.—Please give me the address of some taxidermist or other parties from whom I can procure mounted game birds. Ans. J. H. Batty, New Utrecht, Long Island, N. Y., or J. Wallace, No. 19 North William street, this city.

BLACKSTON, Mass.—Ducks are flying now. Go to Wm. Lane, Good Ground. Well known runners there are W. F. White, Capt. Joe Penny, S. Foster, and Ham Penny. Ducking will probably last until middle of May. Red-heads, brant, broadbills, geese, and coots.

RANDOLPH.—When a dog is apparently in good health, full of life, etc., what is the occasion of the slime or drooling from the mouth, stretching out eight or ten inches sometimes? Ans. The trouble probably arises from defective teeth; examine his mouth thoroughly.

F. S., Westfield.—In your issue of March 2d "F. S." asks "in what year 'The Complete Manual for Young Sportsmen,' by Forester, was published." I would state that it was published by Stringer & Townsend, 222 Broadway, N. Y., in 1857. PHILADELPHIA.

D. S. D., Pittsburgh.—I have a very fine setter bitch who is continually shivering; it differs little whether she is in a warm room or open air. She is four years old. Can you suggest any means to cure her? What is the cause of her shivering? Ans. Have mailed to you a remedy.

C. B., Buffalo.—I notice in last week's paper, under the head of Fish in Market, you quote black bass at 18 cents. Is it possible that black bass are offered for sale in your market at this time of year? Ans. The black bass quoted were from Virginia, and were in season up to the present week.

T. W., Mount Vernon, Ohio.—Please give numbers of your paper that had patterns for tents in. 2. Is a liver and white-colored setter a mongrel, and is black nose better than light? Ans. Have sent circulars; we have no patterns. 2. No; some of the purest setters bred are liver and white. We prefer black noses.

W. H. A., Lima, N. Y.—Please inform me as to the difference in style of working of a cocker and springer. Do they not work alike in cover, and both retrieve from water as well as land? Ans. Cockers and springers are worked in the same manner, and either may readily be broken to retrieve from land and water.

NONCHOKEST, Newark.—What is the cause of my gun fouling when I use brass shells, but when I use paper I find it all right, and also find that I can kill farther with paper. Ans. Because the brass shells do not fit your gun; they are either not large enough in diameter, or else not long enough to fill the chambering of the gun.

RENNOD.—I have a very fine Gordon setter bitch; she will be ready to receive a dog in about three weeks from now. As I know an Irish and a Laverack setter (both splendid dogs) I would like to have your advice which one I have to put to the bitch. Ans. If you are satisfied that the Laverack *is* a Laverack, we should prefer to breed to him.

BROOKLYN.—I have a red setter dog 2½ years old, who, when he cuties his bowels, the stool appears to be tinged with blood. He has also appeared to lose his nose, that was once good. Can you tell me what to do for him? Ans. Try a dose of castor oil with a few drops of laudanum, and feed him on boiled rice and oatmeal well boiled; no meat.

E. C. S., Grand Bay, N. B.—In your issue of January 27th I saw a description of Mr. Innis' ice-boat, Haze. There are a few more details I would like to get—distance between forward runners, length of runners, and shape of shoe. Ans. Distance between runners, 26 feet; length of forward runners, 7 feet 6 inches. The shoe is shaped like a skate iron or sled runner.

M. T., New Brighton, Pa.—My little black and tan slut appears to be getting the mange, as she seems to have a constant itching about the root of her tail. What would be good for it? Ans. Anoint the parts affected with compound sulphur ointment, and give the powders sent you by mail as directed; wash occasionally with carbolic soap, and feed little or no meat.

JOACHIM.—White fish are not predacious. They live chiefly on a peculiar insect found on a plant that grows on the bottom of the lakes. Certain portions of this species of plant has a flavor something like celery, which impregnates both the insect and the fish which feed on it. The algæ of the deep lakes can be transplanted to places where it is desired to raise white fish artificially.

HALL, Newburyport.—I wish you would ask your correspondent how he uses the flannel for his concentrator, whether sewing the charge of shot up before putting it in the cartridge, or if shoving the flannel into the cartridge, then filling with shot and simply closing it, by putting a wad over it? Ans. We presume our correspondent sews the shot in the bag, but perhaps he will answer himself.

C. O. G., Higganum, Ct.—Will you please tell me how to paint decoys for black ducks? Must the body be all black? What color for eyes and bills? How many decoys should be set out together in shooting black ducks? Ans. Black, with some green on the wings; eyes and bills, yellow. In painting them use lamp black and oil, instead of the regularly prepared paint. You cannot have too many decoys.

J. W., Jersey City.—Where can I purchase wild rice seed? In what manner should it be sown? Shall I have to draw the water off my pond to sow it? Ans. Send to Richard Valentine, Janesville, Wis.; Henry Merian, Harwood, Ontario, Canada, or T. P. Cantwell, Brainerd, Minn. For instruction in wild rice culture see FOREST AND STREAM, Vol. IV, No. 3, date of Feb. 25th, 1875. Sow in the spring.

B. A. B., Brooklyn.—1. Is there good fishing and hunting at South Oyster Bay, and how many miles from Brooklyn? 2. Can you name a place where can be had good fishing and hunting not over seventy-five miles from New York? Ans. 1. About thirty miles; some duck shooting and fishing. 2. Barnegat Bay; but you will experience some difficulty in finding good shooting and fishing in one locality, and at the same time.

H. A. W., Hoboken.—When does the law for fishing with hook and line in the Hackensack River expire? Does the law include the tide water, or is it only meant for the fresh water of the river? Is net fishing for catfish and perch allowed in the tide water? Ans. No law applying especially to Hackensack River. There is a close season for bass, pike, and pickerel between March 1st and May 1st; trout can be taken in New Jersey after March 1st.

R. J. S., Philadelphia.—My pet dog (a spitz) seems to have got the mange; has a sore spot on his forehead, from which the hair is falling out, and appears sickly and without spirit; sheds his coat of hair freely. Can you tell me of anything to do for him? Ans. Anoint the parts affected with compound sulphur ointment, reduced with oil so as to be easily rubbed into the roots of the hair, and give him the medicine we have mailed to you, with directions.

T. G. O., East Harrison, Minn.—1. I have a ten gauge laminated steel barrel Parker gun. Where could I have a good job of choke-boring done, and probable cost? 2. What would be probable cost of getting pair of choke-bored laminated barrels fitted to my stock, and would it be your advice to do so? Ans. 1. Send it to Parker Bros., West Meriden, Conn.; the cost ought not to exceed $5. 2. About half the original cost of the gun: unless a very fine one we would not recommend it.

CRUMBS No. 3, Terre Haute, Ind.—Would say to "Subscriber, Providence, R. I.," that he can get wild turkeys alive of David Logan, Palestine, Crawford county, Ill; "J. H. J., Quincy, Ill.," can get a pair of No. 1 hounds by addressing George Ettington, this city, care P. O. box 159. I know whereof I speak, having purchased of George fifty odd coons they have treed this winter. 3. Whore are Jos. Tarvel & Son, and do they make a good gun? Ans. We cannot find their names among the list of gunmakers.

W. H., Southboro.—1. Is there good hunting for deer, foxes, par tridges, etc., and in general a good place for two or three of us to pitch camp in the unbroken wilderness between Island Pond Station and the French village of Contlcook, on the line of the Grand Trunk Railway in Canada? 2. Would Sandwich, Mass., be a good place to go camping out? Ans. 1. Yes; the Megantic region, which is reached from Island Pond Station, has been repeatedly described in our paper during the past two years. 2. Yes.

W. M. M., Basking Ridge, N. J.—Having just finished reading "Camp Life in Florida," I would wish to read more of the same books, as it is my intention to go down in September, and would like to get well read on the same. Please send me the names of any books you publish. Ans. We have published no other work on Florida. There are numberless "Guides" gotten up by the railroad and steamer lines, and Dr. J. Ficet Spear and Mr. Sidney Lamer have each published books for the invalid and tourist.

E. L. T., Saranac Lake.—I have a valuable pup five months old, who is troubled with constant itching near the root of his tail, also on his chest. These parts are covered with thick, tough scabs, and are a source of constant annoyance, otherwise the dog seems well. Ans. Your pup evidently has mange. Anoint the parts afflicted with compound sulphur ointment, and give him the powders we have mailed to you with directions. Wash the parts occasionally with carbolic soap; feed little or no meat until he recovers.

C., Brattleboro, Vt.—The Rangely stream is closed by law from July 1st to March 1st, but you can fish in the neighboring lakes until October. We gave one route last week, which will reach the lower lakes. If you wish to go in the other way and follow the lakes down, take Eastern R. R. to Farmington, thence stage to Phillips, 18 miles, stopping over night at Barden House, thence next morning by stage to Kimball's, at head of Rangely Lake, 18 miles, arriving before dinner. After dinner a steamer will take you down the lake and to Camp Kennebago.

W. E. S., New Haven.—1, Will I be likely to find English snipe in the marshes about here after April? 2. Can I purchase a reliable breech-loader, No. 10, 9 or 10 pounds, under $75; if so, what make? 3. How does the Remington rank among breech-loading shot guns? Ans. 1. Yes, some, during the latter part of April and early in May. 2. There is a Greener gun sold by Mr. Squires for $75. 3. Some of the Remington guns shoot remarkably well, and for the price they are as good, probably, as any made, but their 10-gauge gun does not weigh more than 8½ pounds.

DRAW, Philadelphia.—1. I have a breech-loading rifle. It has "Sharp's Patent, 1859," on one side of the lock, and "Sharp's & Hawkins, Philadelphia," on the other side; 24-barrel, covered with leather. Can you tell me anything of its reputation? Would it make a good sporting rifle for use in Florida, and what cartridge to use? 2. Can the *Florida Agriculturist* be obtained any nearer than Jacksonville; if not, the publisher's address? 1. Your rifle probably takes the 52-calibre rim fire shell. It will answer very well for Florida. 2. Address "Agriculturist office, Jacksonville, Fla."

L. J. O., Philadelphia.—I have a pointer (3 months old) dog; he is ruptured. I have had a bandage on it for a week at a time, but it was impossible to keep the compress on the protuberance, which is about the size of a small hazel nut. I have not had any bandage on it for the last month, but in place thereof have put sticking plaster on it. It does not get any worse, nor any better, and some few say that it may get as large as an egg. Ans. The chances are the protuberance will not increase in size, or interfere with his usefulness in the field. Keep adhesive plaster over it for a few weeks.

J. N. B., Milwaukee. 1. Will you please tell me where I can get the game and fish laws of Wisconsin? 2. Whore can I get a good spaniel and a pointer? 3. Can I get a good breech-loading shot gun for about $40 or $50; if so, whose make would be the best? 4. Where is there good duck and chicken shooting in Wisconsin, within reach of railroads? Ans. 1. Buy "Fur, Fin and Feather," containing the laws of all the States. Can be sent from this office; price 50 cents. 2. What kind of a spaniel and what kind of a pointer do you want? 3. Would recommend the Remington $45 gun.

T. W., Leesburg, Va.—Can't some of your numerous correspondents give us a description of a fly rod for black bass? Neither a salmon rod in strength or weight, nor a trout rod in slightness or lightness—one elastic enough to throw a fly, but stiff enough to play a 7 or 8-pound fish or a brace of such successfully, without carrying weight enough to kill a 20-pound salmon easily? If so, he will find many attentive readers in Virginia and the South Atlantic States. If the snow melts, we will make some experiments with new fangled flies upon the bass in April. Ans. See Vol. III, pages 283 and 298, and especially Vol. IV, page 107.

ENQUIRER, Morristown, N. J.—1. I have a cocker spaniel pup, about five months old, which is of good breed and appearance, but has not yet been trained. Can you give me instructions as to how to train him? 2. At what age is it best to begin to train the dog? 3. What is a black and white dog of the above breed whose mother was imported from England worth, both before and after training? Ans. 1. In "The American Kennel and Sporting Field," by Arnold Burges, you will find full directions for breaking dogs to retrieve? 2. At five or six months old. 3. If thoroughbred and handsome $25 before they are broken, and $40 or $50 after being well broken.

W. DER.—Will you kindly inform me from whom I may obtain young brook trout? I wish to stock a fine brook in this State, which formerly contained trout, but which now is entirely barren. How many should I have to get, and what would be the probable cost of the same? May, I believe, is the proper month to stock trout streams. Ans. Send to H. H. Thomas, Randolph, N. Y.; J. S. Hines, Patchogue, Long Island; W. H. Furman, Maspeth, Long Island; Seth Green, Rochester; A. S. Collins, Caledonia. You'll need a thousand small fry at $18, or two dozen spawners. Trout spawn in the autumn. See Seth Green's letter in FOREST AND STREAM of March 16th.

DICK, Rochester.—Can you inform me of the exact locality of South Lake? I think it is in the vicinity of Booneville, but don't know how far from there. Can you tell me what stream is the outlet or inlet of South Lake? What game is in season about there after June 1st? Ans. South Lake, or South Lake Reservoir, as it is called, on account of being one of the feeders of the Black River Canal, is three miles southwest of Jack's Lake, which is reached by a road from Prospect, on the W. & B. W. Railroad. It is about 25 or 30 miles east of Booneville, at the head of Black River. 2. None until after July 4th, when there may be some woodcock; grouse in the fall.

E. M., Thomasville.—Kindly inform me where, if any, good snipe shooting can be had this and next month in the Spring region of Virginia, reached by the Virginia and Tennessee Railway? Ans. Not well informed. Any snipe shooting to be had in the vicinity of Baltimore, say within fifty miles? Ans. Excellent snipe shooting at Hunting Creek and other places near Alexandria, Va., and also in Worcester county, Md., and Delaware City. Can you give me any information about trout fishing in the vicinity of Morgantown, N. C.? Ans. There is good trout fishing in nearly all the mountain streams of Burke and adjoining counties. See FOREST AND STREAM, May 23th, 1874, page 311.

G. A. F., Foxboro, Mass.—Will you please inform me what are the symptoms of a mad dog? We had a hound dog go through our streets yesterday, biting every dog he came in contact with, also killing quite a number of fowls. After he was killed, it was found that his throat was badly swollen. Was it hydrophobia? Ans. The probabilities are that the dog had hydrophobia. The symptoms are pendulous lower jaw, flowing saliva, vacant expression, weak hind legs, and half unconscious movements. We have no doubt, however, that many dogs are destroyed who are not afflicted with rabies at all; still, whenever there is a doubt, or any of the symptoms are present, we suggest that the animal be immediately destroyed.

S. B. D., New York.—1. Will you please to inform me in your next issue if there is not a law to prevent a man from running a net across a public stream for the purpose of taking trout? 2. I have a large pond, well adapted for trout, but it is filled with catfish. Can I get them out in any other way except letting the water entirely off? Under the circumstances that means is impossible. What would you recommend, then? Could I successfully stock it with black bass, and would they harm the trout? Ans. 1. There is; trout can only be netted on private waters, and for purposes of propagation. 2. Giant powder is the only agent with which you can exterminate your catfish. Trout and black bass should not be placed in the same pond.

G. M. J., New York.—1. Will you oblige by giving me some information as to where I can get good trout fishing within 100 miles of New York? 2. Is there any back of Rondout? 3. Can I get any on Long Island without being a member of a club? 4. Where is the Rangely, and how do you get to it? 5. Does the recent law prevent fishing there this season? Ans. 1. As to *good* trout fishing, it is difficult to find within that distance. Near Canaan, Conn., the fishing is fair, and some fine baskets are occasionally made on the Sawkill near Milford, Pa. 2. Do not know of any. 3. No, not worthy of mention. 4. Near Andover, Maine, and a place well worth visiting, where the largest brook trout are taken. Reached by Boston and Maine Railroad to Portland, thence Grand Trunk Railroad to Bryant's Pond, thence by stage to Andover. 5. Only in the river.

A. G. S., Canton, Montana.—1. Where can I obtain Kay's linen cartridge, and cost per 100 for same? 2. Do you prefer the Ward-Burton rifle for large game over the Winchester? Some of the sportsmen here say that the Winchester is apt to get out of order in very cold weather, often miss fire, the spring not being of sufficient strength. 3. Where can I obtain the Eureka Nut, lately advertised in your valuable paper, for the cure of tape worms in dogs? 4. What would be the cost of 20 back numbers of FOREST AND STREAM, to complete a volume of same, and where can I obtain them? Ans. 1. Of H. C. Squires, No. 1 Courtlandt street, this city. 2. The Ward-Burton rifle is not on the market. We have never before heard of the Winchester getting out of order as you describe, and think you have been misinformed. From our Kennel Editor. 4. $2; from this office.

BREECH LOADER, Pittsburgh.—I bought a 12-bore double gun, 7¼ lbs. weight, and although I could not obtain any kind of a pattern, I obtained a terrific power of penetration. I loaded it with brown paper shells, Ely make, three drachms No. 4 orange lightning powder, two Ely felt wads on powder, 1¼ oz. Tatham No. 8 shot, and Baldwin wad on shot. Not a dozen shot went a 30-inch circle, at say 30 yards. I tried various sizes of shot with no better success. I took the gun back and got another, same gauge, only it weighs 8 6-16 pounds, and it behaved in exactly the same manner as the first—terrific power, but no pattern. Could you tell me what is wrong? It is a splendid looking gun, cost me $325 cash, and contains all late improvements. Certainly it must be in the loading, for both performed exactly alike. Ans. The only way we can account for the remarkable shooting of your gun is in the fact that the shells do not fit the chamber; if they were turned too short it might produce just the effect you mention.

B. C., Cleveland, Ohio.—A party desire to start about July 15th for a trip down the St. Lawrence River to the gulf; thence along the coast and New England States to New York. How long would it take to make the trip from Niagara Falls to New York? What places ought we not to fail seeing? Where on our route could we stop a day or two with good accommodation for our lady tourists, and get good fishing; and what would be a reasonable estimate of the expense of the same per *capita*? Ans. Rail from Suspension Bridge, Niagara Falls to Toronto, or rail to Lewiston, and thence steamboat to Toronto. From Toronto take coast steamer through Lake Ontario to Montreal, touching at Port Hope, Newcastle, Cobourg, Belleville, Kingston, Clayton, Alexandria Bay, and other points. This trip includes the Thousand Islands and the rapids of the St. Lawrence. Steamer from Montreal to Quebec; thence Gulf Port steamer to Pictou, Nova Scotia, touching at Murray Bay, Cacouna Nez Perce, Gaspe, Dalhousie, Chatham, Shediac, N. B., and other intermediate points. Thence rail to Halifax, Nova Scotia; thence rail to Annapolis or Windsor, and steamer across the Bay of Fundy to St. John; thence steamer to Eastport, Portland, and Boston; thence rail or steamer to New York. Time, two weeks: fares, only about $50. Bass fishing at Belleville; trout fishing at Cacouna, and bass and muscalonge at Alexandria Bay.

J. R. S., Hannibal....1. In answering a question some time since, you said the Remington $45 shot gun was a good one for the price. Now, do you mean that the gun is a poor one, and that is scarcely any account, or what do you mean by it? As I want a gun that will shoot well, and have been told that that gun is as good for shooting as a high priced English one, I wish you would be a little more explicit. 2. Am thinking of going over to Perry Springs to spend the summer, near the Illinois River. Now what sort of fishing tackle had I better take with me? What fish will I find worth catching, and best way to catch them? 3. What is the reputation of W. Ellis, London, as a gun maker? 4. Does Mr. Dittmar send canisters of his powder by mail, or how can we get it here? 5. I notice, in giving proper charges for guns, that you use large quantities of powder. What do you think of Mr. Hooper's (in his Dog and Gun) manner of charging with very small loads? Is it gone out of fashion, or what is your opinion of it? Also, is his manner of training dogs correct? 6. Is there any place in New York where I can get a paper model of the ribs, keel, &c., of a Baden Powell canoe, so that I can make it myself? Ans.—1. We meant exactly what we said—that the gun was a good one for the price; we might have said as good as any. We bear of some of them that shoot remarkably well. As for a $45 gun being as good as one worth $200, it is nonsense; the cheap gun might shoot as well for a time, but the other would probably outwear many of them. 2. Black bass; take the appropriate tackle, which can be purchased of any dealer. 3. Good. 4. You can have it sent by express. 5. Larger charges are used now than in Mr. Hooper's time. The system of training he mentions is a good one. 6. We do not know of any.

FOREST AND STREAM

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCULCATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

A discount of twenty-five per cent. allowed for five copies and upwards.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent.; over six months, 30 per cent.

NEW YORK, THURSDAY, MARCH 30, 1876.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Editor.

WILLIAM C. HARRIS, Business Manager.

BLOOMING GROVE PARK.—At the annual meeting of the Blooming Grove Park Association, held at the club house of the park, in Pike County, Pa., March 14th, the following named gentlemen were elected directors for the present year:—Genio C. Scott, Dudley Field, George S. Green, Jr., E R. Wilbur, Charles Hallock, George H. Glenney, S. D. Bruce, F. S. Giles, A. H. Wellington, and Joseph Dore.

At a called meeting of the Board of Directors, held at the Hoffman House in this city, Wednesday, March 22d, the following officers were elected to serve for the ensuing year:—President, John Avery; Vice President, A. H. Wellington; Treasurer, George H. Glenney; Executive Committee, John Avery, *ex officio*, President; E. R. Wilbur, G. H. Glenney and A. H. Wellington; Consulting Engineers, George S. Green, Jr., and John Y. Culyer. The affairs of the association are never in a more promising condition, and the members are in high spirits over an ultimate grand success for the club.

—During the heavy gale of last week the car house on the top of Mount Washington, sometimes used for storing the cars in winter, but which fortunately was empty at the time, was blown over. The wind was blowing a hurricane and the wreck has probably gone into the bottom of some deep ravine from whence it will never emerge again. This building was used by the Signal Service party during the first two winters of their stay on the Mountain.

—Mr. Jas. Donahue's pack of fox hounds were to have met this morning at day-light near Hackensack, and an effort made to kill a fox. We wish the fox-hunters success. Captain Bogardus was also to visit Hackensack this afternoon for the purpose of shooting an exhibition match at the Mansion House. Altogether, quite a lively day for Hackensack.

—The annual meeting of the Massachusetts State Sportsmen's Association will be held at Springfield on April 26th, a very auspicious date, as the great Bench Show of the Rod and Gun Club, to be held at the same time, will attract sportsmen from every direction and prove an additional incentive to the members of the Association to assemble in force.

—The members of the Suffolk (Long Island) Club report unusually good trout fishing this season from their well stocked pond.

TURNING THE TABLES.

A RATHER remarkable suit was tried before the Westminster County Court in England the other day, in which Mr. Wilberforce, himself a magistrate, barrister and lord of the manor, was defendant, and two sons of George Ayling, a laborer, the plaintiffs. It seems that these boys had been poaching upon the defendant's land and having been detected trespassing in pursuit of game, Mr. Willberforce, being loth to bring the boys before the bench of magistrates, whereby they might have been sent to jail and their character ruined, complained to their father and requested him to punish them. This the father readily consented to do, but as he said his hand was disabled requested Mr. Wilberforce to inflict the flogging. The lads were then sent to defendant's house, and being asked which they preferred, being flogged or taken before the magistrates, they declared for the former alternative, and taking down their own clothes were "birched" in real Eton style.

Had the matter ended here all would have been well, and the boys morals and manners improved by the salutory flogging; but some one put it into the head of the father that the whipping was technically illegal, and the consequence was the suit above mentioned, resulting in Mr. Willberforce being mulcted to the extent of £15 damages together with the costs. Nor have the unfortunate gentleman's troubles ended with the pecuniary loss. An ambitious member of Parliament has made the matter a subject of question in the House of Commons, and suggests that Mr. Wilberforce, be, for his conduct, removed from the commission of the peace, so that having lost his game and money, he is still likely to lose his county position. Commenting upon the case our contemporary, *Land and Water* says.—

"We cannot help saying that Mr. Wilberforce has in our opinion been very badly treated. Technically he was wrong: the law was against him; for however well-merited the correctiou which he inflicted on these lads, they had not been legally proved guilty of any crime, and had they been so convicted our courts never allow an injured party to himself inflict the punishment due. Hence the flogging was contrary to law—a common assault, in fact; and, as a barrister, Mr. Wilberforce ought to have known better than to have run the risk of falling into the hands of a town jury, which sympathizes always with the youthful poacher rather than with the preserver of game. But when we consider the equity and the moral aspect of the question we find that everything is in favor of the unlucky Mr. Wilberforce. Though a magistrate, he was not acting in his magisterial capacity, and indeed was not a member of the Bench which would have tried the case. His motives were praiseworthy: he wished to save the lads from public disgrace, and their father from a fine. This father agreed to punishment, so did his sons. The boys had for the second time been detected in dishonest practices, and if they are thus to make a double profit—in game and in money—out of their dishonesty, who shall tell us how we are to keep the young from sinning?"

THE CENTENNIAL.—We have received from Mr. L. Henry Twaddell the following list of special prizes offered in the Agricultural Department to date:—

$1,000—Jersey Cattle Club, for best Jersey herd.
$1,000—Pennsylvania Agricultural Society, to be given in prizes.
$1,000—Memphis Cotton Exchange, for best bale of cotton from either States of Mississippi, Arkansas, Alabama, Tennessee.
$200—Messrs. B. K. Bliss & Son's, for the best display of potatoes in pecks.
$100—Messrs. D. Landreth & Son's, for the best display of vegetables at a stated period.
$75—Mr. Landreth, for the best essay on Forestry.
$50—Messrs. Henderson & Son's, for the best essay on the cultivation of the cauliflower.
$50—Messrs. Heuderson & Son's, for the best essay on the Cultivation of celery.
$150—Produce Exchange of Philadelphia, for best cheese.
$150—N. W. Dairymen's Association, for best butter and cheese.
——National Dairymen's Association, for best cheese.
$150—Poultry Society.
$100 (cup)—FOREST AND STREAM. (Dog Prize).
$50 (cup)—Chicago *Field*. (Dog Prize).
$50 (cup)—C. S. Westeott. (Dog Prize).
——N. E. Bee Keepers' Association.
$200—Proprietors of "American Food for Cattle," in four prizes of $50 each for horses, cattle, sheep, and swine, the owners to certify they have used the food.

The New York Agricultural Society offers free transportation (to and from Philadelphia) on all their first prize animals.

THE WEATHER AT THE SOUTH.—The cold weather which visited us last week appears to have extended to Southern Georgia and Florida. Advices from those points indicate that early fruits and vegetables have been generally ruined as far South as Gainesville, Florida, notwithstanding that the farmers kept fires burning in the fields. We now have strawberries, green peas, etc., in market, the former selling as high as two dollars and a half per quart. If the crop at the South has been destroyed these high prices are likely to be maintained. Tomatoes are worth eighty cents per quart and new potatoes one dollar per peck.

—If any of our readers think that Fred Mather is not modest and retiring, let them read the following protest. We trust all will take heed, and govern themselves accordingly in future:—

"I would be pleased if correspondents would not speak of me as United States Fish Commissioner, nor as "Professor." The first title belongs to Prof. Baird alone, and I have never even been one of his deputies, in fact, only an employee. The latter I am not covetous of as I am not a graduate of any institution that could confer it; nor have I ever trained a horse, practiced ventriloquism, or handled dumb-bells. If FOREST AND STREAM will set the example in this matter I will feel obliged. FRED MATHER."

A GREAT HORSE GONE.

THE famous stallion, Hambletonian, died at Chester, N. Y., on Sunday evening last, aged twenty-seven years. Hambletonian, if he cannot be called the father of trotting in this country, can certainly claim to have produced more trotting horses than any other stallion, nearly fifteen hundred colts having been produced by him during the twenty-five years he has been at the stud. Of these the names of Dexter, Edward Everett, Volunteer, Messenger Duroc, Jay Gould, and a hundred others, are household words. It would be interesting to know the value of the stock now claiming descent from this illustrious horse, and we have no doubt that some of our contemporaries who devote more space than ourselves to horse topics will publish such statistics. Hambletonian was foaled May 5th, 1849, at Sugar Loaf, near Chester, Orange county, New York, on the farm of Jonas Seely, who sold him the following fall, together with his dam, to Wm. M. Rysdyck, for $125; he has remained in the family of the latter ever since. The celebrated stallion Abdallah, owned by Mr. Alexander, of Kentucky, was got by Hambletonian when only two years old. It is said that up to 1866 he had netted his owner over one hundred and fifty thousand dollars as a stock horse alone, his fee of late years being five hundred dollars. His late owner, Mr. Rysdyck, is reported to have left provision in his will that Hambletonian should, upon his death, be stuffed and presented to the Central Park Commissioners. We cannot vouch for the truth of the report, but it would be a pity to have a horse of such world-wide celebrity covered up in a hole and left to decay like any common carcass.

GAME PROTECTION.

—An effort is being made to to establish a Game Protective Society in Albany, N. Y. Twenty names have been placed on the list, but, although there is much need of such an association and Albany contains many sportsmen, they do not seem to respond with alacrity to the call. A correspondent writes us that their woodcock are now all killed off before the 4th July, and what would otherwise be excellent shooting is utterly destroyed.

—"Mr. W. K. Townsend, the attorney for the Monroe County Sportsmen's Association," says the Rochester *Express*: "Has drawn up a paper containing a number of suggestions for the amendment of the laws, and there can be no doubt that these suggestions are well worthy of consideration. He suggests that the law (regarding illegal fishing in Irondequoit Bay) be amended so that the game constable will have power to arrest without a process any person found violating the provisions of the act; so that the county can try the case; and so that in case of conviction the defendant shall be fined at least $50, or sent to the jail for a term not to exceed ninety days.

His last recommendation is the prohibition entirely of all fishing in waters in Monroe, Wayne, and Orleans counties, except with a hook and line, under a penalty of $50 for each offense.

Mr. Townsend says: As the law now stands, it affords no protection whatever to fish; in fact, it is worse than no law at all.

There probably never has been such a reckless and wholesale destruction of fish in Irondequoit and Sodus bays as has been carried on during the past winter. Tons of fish have been taken from Irondequoit Bay the past winter with nets and seines—the large ones taken to market and the small ones left in piles to rot in the open air. There seems to be a band of worthless and desperate men who openly declare that they do and will catch and destroy all the fish they please; that they care nothing for the law (neither should they for it cannot harm them much) and they snap their fingers in the face of any person who dare even remonstrate with them. The result is that all the Game Constable can do under the law only tends to incite these men to more reckless violations of the law."

What is wanted is a careful selection of the men who are to act as Game Constables, and then strengthen their hands as Mr. Townsend suggests. We regret that we have no space for all of his paper.

Game and Fish Laws of Maine.

We published some time since a brief abstract of the game and fish laws of Maine as amended during the last session of the Legislature; having now received them in more extended form we reprint them again, particularly as some of the unpublished sections are of the utmost importance; particularly "Chapter 98," which forbids the carrying of game out of the State:—

CHAP. 61—SEC. 13. If any person has in his possession the carcass or hide, or any part thereof, of any such animal (moose, deer, and caribou) between the first day of January and the first day of October, he shall be deemed to have hunted and killed the same contrary to law, and be liable to the penalties aforesaid; but he shall not be precluded from producing proof in defence. In case of his conviction, such carcass or hide, or any part thereof, so found in his possession, shall be decreed by the court forfeited to the use of the person prosecuting. Approved February 1st, 1875.

CHAP. 67—SEC. 1. There shall be between the first day of April and the fifteenth day of July each year, a weekly close time of four days; from sunrise on Sunday to sunrise of Thursday of each week; during which no salmon, shad, alewives, or bass shall be taken or destroyed from or in the waters of the Penobscot River, or its branches above the railroad bridge between Bangor and Brewer, but between said Thursday and Sunday at sunrise, as aforesaid, it shall be lawful to take any of said fish in said waters above said bridge, any law to the contrary notwithstanding. Any person violating the provisions of this act shall be liable to a penalty of fifteen dollars for each salmon, and five dollars for each other fish aforesaid, taken or destroyed from or in said waters during the period above interdicted. Approved February 7th, 1876.

CHAP. 98—SEC. 1. No person shall kill or expose for sale, or have in his or her possession after the same has been killed, any woodcock, or ruffed grouse, commonly called partridge, except during the times named for the purposes hereinafter mentioned, namely: Any person may, for the purpose of consumption as food within this State, lawfully kill, expose for sale, or have in possession any woodcock between the first day of September in any year and the first day of December following, both days inclusive; or any ruffed grouse between the first day of September in any year and the first day of December following, both days inclusive.

SEC. 2. No person shall kill or expose for sale, or have in possession except alive, at any time, any woodcock or ruffed grouse with the intention of sending or transporting, or of having the same sent or transported beyond the limits of the State, under penalty of not less than five nor more than ten dollars for each woodcock or ruffed grouse that killed, exposed for sale, or had in possession.

SEC. 3. Section one of chapter two hundred and thirty-nine of the public laws of eighteen hundred and seventy-four, is hereby amended by striking out all of said section after the words "Section one," and inserting in the place thereof the following words, viz.:—

No person shall kill or have in his possession, except alive, or expose for sale any wood-duck, English snipe, or woodcock between the first day of December and the first day of September following; or kill any ruffed grouse, commonly called partridge, between the first day of December and the first day of September following, or have the same in possession, except alive, or expose for sale between the fifth day of December and the first day of September following; or kill, sell, or have in possession, except alive, any quail or pinnated grouse, commonly called prairie chicken, between the first day of January and the first day of September following, under a penalty of not less than five nor more than ten dollars for each bird so killed, or had in possession, or exposed for sale.

SEC. 4. Sections four and five of chapter two hundred and thirty-nine of the public laws of eighteen hundred and seventy-four, are hereby made applicable to this act, the same as they would have been had the preceding sections of this act been incorporated in said act of eighteen hundred and seventy-four, between the sections therein numbered four and five. Approved February 18th, 1876.

CHAP. 125—SEC. 2. No person shall at any time catch, take, kill, or fish for any land-locked salmon, trout, black bass, or Oswego bass by means of any grapnel, spear, trawl, weir, net, seine, trap, set line, either through the ice or otherwise, or with any device, or in any other way than by the ordinary way of hand fishing with a single baited hook and line, or with artificial flies, under a penalty of not less than ten nor more than thirty dollars for each offence, and a further fine of one dollar for each fish so caught, taken, or killed. And all set lines, grapnels, spears, trawls, weirs, nets, seines, traps and devices other than fair angling as aforesaid are hereby prohibited on the fresh water lakes, ponds, and streams of this State; and when found in use or operation on said lakes, ponds, or streams, they are hereby declared forfeit and contraband, and any person finding them in use in said waters is hereby authorized to destroy the same.

SEC. 3. No person shall catch, take, kill, expose for sale, or have in possession, except alive, any land-locked salmon between the fifteenth day of September and the first day of March following; or any trout between the first day of October and the first day of March following; or any black bass or Oswego bass between the first day of April and the first day of June following, under a penalty of not less than ten dollars nor more than thirty dollars, and a further fine of one dollar for each fish thus caught, taken, killed, exposed for sale, or in possession, except as aforesaid.

SEC. 5. Nothing in this act shall be construed to prevent any person or persons from lawfully catching fish in waters owned by him or them for the purpose of stocking other waters, or to prevent the Fish Commissioners or their agents, duly authorized, from lawfully taking fish at any time or in any manner for the purposes of propagation, or for stocking other waters.

SEC. 6. All acts or parts of acts conflicting with this act are hereby repealed. Approved February 23d, 1876.

Smelts in Massachusetts.

BOSTON, March 18th, 1876.

EDITOR FOREST AND STREAM:—

In your issue of February 10th, a correspondent signing himself "A. F. G.," after speaking of the immense number of smelts taken legally with hook and line at Danvers, Mass., and of their large size, three weighing just a pound, goes on to say, "One evening last spring, while passing a brook in this place, I saw full thirty men and boys engaged in taking them with dip nets, which is contrary to the laws of this State. The town of Danvers has Fish Commissioners, but they seem to take no interest in stopping this wanton destruction." Now, if the aforesaid "A. F. G." has not the courage to complain of these violators of the law let him send me word, or any member of the Massachusetts Anglers' Association, and we will agree to see that the law-breakers are properly dealt with, or let the gentleman keep in mind the act passed by our Legislature two years ago, which I send you for his information. I particularly call his attention to Section 3, and advise him hereafter to make complaint to the officers of the town instead of sending the information to distant New York. What our association wants is information, and we will take care of the conviction. The law as it stands leaves no discretion to the officers of any town or city, but says they *shall* cause the provisions of the act to be enforced. The great trouble with most would-be informers, but dare not, is, they have not the moral courage to inform only in a general way, and when questioned are dumb as to the parties who are violating the law. I should like to have "A. F. G." join our association if he will send his proposal with his real name and help us to increase and protect this beautiful fish. If found worthy we should be pleased to admit him as a member.

JOHN P. ORDWAY, M. D.,
President Massachusetts Anglers' Association.

Copy of the act passed in 1874, and which is now in full force in our State:—

SECT. 1. Whoever within this Commonwealth offers for sale or has in his possession any smelt or smelts between the fifteenth day of March and the first day of June in each year, shall forfeit for each and every smelt so sold, offered for sale, or had in his possession, the sum of one dollar.

SECT. 2. Whoever takes or catches any smelt or smelts with a net of any kind, or in any other manner than by naturally or artificially baited hooks and hand lines, shall forfeit for each smelt so caught or taken the sum of one dollar.

SECT. 3. The mayor or aldermen of any city, the selectmen of any town, and all police officers and constables within this Commonwealth, shall cause the provisions of this Act to be enforced within their respective cities and towns; and all forfeitures and penalties for violations of the provisions of this act shall be paid, one-half to the person making the complaint, and one-half to the city or town in which the offence is committed.

SECT. 4. All acts conflicting with this Act are hereby repealed. Approved April 9th, 1874.

A PRETTY PRESENT FOR THE CENTENNIAL.

GALVESTON, Texas, March 16th, 1876.

EDITOR FOREST AND STREAM:—

Do you think Fred Mather would like an alligator ten feet long? I have a pet on a farm of mine, and the fellow has grown so big that we are getting afraid of him. He came near catching a fine bull calf the other day, and has eaten up a half dozen pigs. Do you think by boxing him up with some straw he could stand the cold? They go for a long time without food. If Fred had a tank made for him with an old log in it, the "gator" would be all right, and the whole Centennial might gaze on him; he would only wink his eye. JOS. LABADIE.

[Your favor has been forwarded to Mr. Mather.—ED.]

SEALS IN STATEN ISLAND SOUND.—A rather remarkable fact in the past winter has been the appearance of white and black seals in the Staten Island Sound, which have ventured up as far as Mariners' Harbor Lighthouse, fifteen miles from open water. A few yet remain in this locality, and are fed daily by the keeper of the lighthouse. They come to the surface twice a day and creep up on a float, where they lie basking in the sun, and are so tame that a dog, owned by the keeper, jumps upon the float and licks them.

SHORT ICE CROP.—The ice harvest on the Hudson River is ended. The total amount of ice stored is 406,300 tons, and the total amount stacked is 39,800 tons. This is said to be 1,000,000 tons less than the average yied. The ice men in Maine have a good prospect for disposing of their crop this year, and they have lately been making extra exertions to store up a large stock.

—Over 38,000 squirrel tails were received at the office of the County Clerk, of Lake Co., Cal., in 1875, to claim the bounty offered for the extermination of the pests.—*Petaluma Argus.*

METAPHYSICS OF FLY FISHING.

PART SECOND.

IN an insect's life there are the three familiar forms, larvæ, pupa, and imago. Larvæ are frequently used as bait, pushed squirming, wriggling, protesting on the bare hook. Of these so martyred, there are *Phryganidæ* larvæ barbarously drawn from their castles, known as caddis bait to the destroyer, grubs, larvæ of beetles, maggots, or gintles, larvæ of the diptera, caterpillars, larvæ of moths. The only pupa so sacrificed belongs to the family of Lialis, known by the suggestive appellation of hellgramite. Of the adult insects or imagines, the *Locustariæ*, or grasshoppers, are a common bait. The imitations used are of four forms. The fly proper, with clear, smooth body, feet, wings with or without caudal setæ. Palmers, body covered with hairs bristling in all directions from one extremity to the other. The hackled fly, body like the palmer with wings, and sometimes caudal setæ. The hackle, body smooth with hackle closely wound at the head, the upper part of the hackle representing the wings, the lower the feet. This is what the old authors call a "fly made buzz," a fly with its wings in rapid motion. It imitates some small flies with heavy drooping wings as they flutter over the surface of the water. One of the most difficult things in describing insects, is to find words to name their colors correctly. The analysis of the prism is at discount. In some there are a blending of primary, secondary and tertiary colors that would defy a sage to define. Fortunately for the fly-maker these colors are reproduced in the feathered race, or *vice versa*, if you please. Not that I think the coincidence was intended for the benefit of the fly-maker. In imitating insects the size of the fly must correspond with the size of the insect, that the fly, when made will be of the same size as the insect imitated. All nondescript flies should be of the same size as the natural inhabitants of that particular stream they are thrown on.

It is a strange, but peculiar fact, in insect economy, that the small streams have a small sized insect fauna and the larger streams a correspondingly larger. They are not the same identical insects, but sometimes closely allied species. I will here state for the benefit of the uninitiated in bug lore, that insects when they have assumed the perfect or winged form, no matter how long the term of life is afterward, never change, never grow.

The waters of the United States and Canadas, homes of the *Salmonidæ* family may be classed in three or more general divisions, each with its own well defined insect fauna. The first of these we will consider are Head Springs. In these the water is of a uniform temperature. Their even flow the least disturbed from rains, snow water, and freshets. The birthplace of the trout, and the richest in insect life. The water is at all times swarming with animalculæ. The wonderful reproduction of these diminutive orders supplying food for the larger, and they in turn for the fish. Insects leave these waters about a month earlier than they do other streams. The first that present themselve are of the family *Chironomidæ*, belonging to the order *Diptera*. The chief distinguishing characteristic of this order is their having but two wings—all other orders have four. The larvæ are long, slim, worm-like, some a blood red color. They are aquatic, or rather they live in that soft mixture of mud and water with its slimy growth of vegetation offering a treacherous foothold to the investigator, where sinking lower and lower they feel as if they would soon be exploring that region no one wishes to know of. When ready to change to pupæ, they bury themselves deeper in the mud. The outer skin hardens, and to all appearance, they are at rest, but really preparing for a most wonderful metamorphose. From its changes the body contracts in its case, leaving a sort of vacuum, so that when it finally wriggles itself out of the mud into the water it floats to the surface. The case slits open above the thorax and the fly comes out. Of these there are five that appear in such quantities that they may be preëminently distinguished as fish food. They are piscatorially named, black, dark claret, bright claret, gray, and olive gnats. These insects are double brooded, that is the cycle of their life is repeated twice every year. Their first exodus, if the weather is favorable, is from the last of March to the first of May. Their second, through August and September. They may be farther distinguished, as morning flies, as the majority leave the water during the hours of seven and eleven A. M.

Another genus, immense in numbers, but small in size, that metamorphose at this season, belongs to the family *Ephemeridæ*, order *Neuroptera*. In this genus the second pair of wings are rudimentary. The pupa is active and closely resembles the larvæ. They are brisk, rapid swimmers, live an independent, unsocial life, keeping close to the bottom of the creek where their murky muddy color protects them from the vigilant eyes of their pursuers. When disturbed they unhesitatingly risk an open flight, first up to the surface, skim along a little way and then down again. These are their tactics on the defensive. It will be almost needless to write that these are favorite game for trout, and where one is you may be sure to find the other. It is impossible to rear them in aquaria. If the water becomes a degree or two warmer than that in the bed of the creek, both larvæ and pupæ perish almost instantly. When ready to take wing they rise to the surface under some protecting shade, avoiding the uneven temperature of the banks. With a heaving motion of the body the thorax slits open, two upright wings flash out and are held aloof until the feet and setæ are drawn out; for an instant it rests on its old coat, and then flies off a sub-imago to await its last metamorphose, which takes place in from ten to twenty-four hours after leaving the water. A delicate parchment-like coating is thrown off the entire body, head, feet, wings, and setæ, leaving the insect with paler colors—transparent wings and translucent body. The familiar nomenclature for this family is dark fox, poor man's fly, red fox, and bright fox. These begin to make their appearance the middle of April. There are a succession of broods throughout the summer months. They leave the water in the evenings, some very early in the mornings.

The black hackled fly has no natural history, only a history of long experience, a captivating fly for all streams. Its most wonderful exploits as a lure were when the water was discolored with rain. The ibis is probably taken for a flower or animalcule. Many forest trees have at this season a blossom whose petals are of this scarlet color. The palmers or caterpillars are to be used wherever fish are to be caught *ad libitum*. The professor, grizzly king and queen of the water, are general flies for all streams, and all seasons. Like the black hackled fly and ibis, these should be held in reserve for the days and hours where the six-footed race are lying in ambush. SARA J. MCBRIDE.

The Rifle.

POWDER CHARGES FOR RIFLES.

Our readers will remember that some time since we published an abstract of the results of a series of exhaustive experiments made by General Shaler at Creedmoor, with a view to determine the charges of powder to be used most advantageously in long range shooting. The following letter on the subject, written by Mr. John Rigby, the well-known rifleman and member of the first Irish team, was recently received by us, and being referred to General Shaler he has kindly furnished us with a reply, which will be found below. The subject is one of great importance to riflemen:—

DUBLIN, February 14th, 1876.

EDITOR FOREST AND STREAM:—

Under this head appeared in yours of 27th of January a very interesting and instructive account of certain experiments carried out at Creedmoor, for the purpose of determining the best charge of powder for long ranges. Great credit is due to the patient experimentalist who underwant the drudgery of so prolonged a trial for the instruction of riflemen generally, and the thanks of all will, I am sure, be freely given to FOREST AND STREAM for publishing it *in extenso*. To complete the obligation under which you have placed scientific riflemen by doing this it is only wanting that such further details be given as will enable those who desire to do so to repeat the experiment for themselves, and so by a true comparison ascertain the relative values of their rifles and ammunition, and those used in the trials reported. For this purpose a fuller account of the method employed is requisite, and I will note the principal points by questions to which I hope Gen. Shaler will be good enough to furnish answers. First. What was the exact method used in computing the mean deviation given? In replying to this it is necessary to state how many shots were measured in each string as the mean deviation of fifty shots, and of five strings of ten shots each are two very different things. Secondly. Was each string fired without moving the sight, or were corrections made during its progress? Thirdly. What was accounted the deviation of a miss? At the 1,000 yard range misses must have occurred, with a Creedmoor target, in some of the strings. Fourthly. What were the elevations required for the different charges? This is a most important point, and to answer it exactly the angle of elevation over the horizon should be given. If this were not taken at the time it can easily be measured now, and the angle in degrees and minutes added to the table. Fifthly. What was the weight of the projectile? Sixthly. What kind of rifle was used? If General Shaler or the experimentalist will take the trouble of answering these questions he will complete the good work he has already done, and I will undertake to send you for purposes of comparison some results of experiments made by me, and others in the country, from time to time.

JOHN RIGBY.

OFFICE OF THE NATIONAL RIFLE ASSOCIATION,
NEW YORK, March 25th, 1876.

JOHN RIGBY, ESQ., *Dublin, Ireland:*

DEAR SIR—I have been handed your letter of February 14th, addressed to the FOREST AND STREAM, with a request to answer your inquiries in reference to the experiments made at Creedmoor, last year, to determine the powder charges for long range shooting. It affords me pleasure to do so, as follows. You inquire:—

First. "What was the exact method used in computing the mean deviations given? In replying to this it will be necessary to state how many shots were measured in each string, as the mean deviation of fifty shots and of ten shots are two very different things." Ans. In all cases the correct elevation was obtained by two or more shots, then a string of five to twenty (generally ten) shots was fired. With the aid of a telescope *all* the shots in each string were accurately located, and marked on the score book diagram. The target and the diagram each having three parallel lines drawn across the face twelve inches apart to facilitate measurements, the middle one in the centre of the target. At the end of the days' shooting the average deviation from the centre parallel line was obtained by dividing the total of the measurements by the number of shots in the string. Upon the completion of the fifty shots the total of the measurements was divided by fifty and the result recorded.

Second. "Was each string fired without moving the sights, or were corrections made during its progress?" Ans. As a general thing the strings were fired without moving the sights, but corrections were made when necessary.

Third. "What was accounted the deviation of a miss?" Ans. Misses were all counted as measuring thirty-eight inches.

Fourth. "What were the elevations required for the different charges? This is a most important point, and to answer it exactly the angle of elevation over the horizon should be given." Ans. At 800 yards the elevation varied according to conditions with 90 grains lubricated, from 1° 53′ to 2° 5′, Vernier scale. With 120 grains, on the same day and at the same hours, from 1° 54′ to 1° 59′. At 1,000 yards, with 90 grains lubricated, from 2° 34′ to 2° 47′. With 120 grains, from 2° 26′ to 2° 37′. These were the extremes of powder charges of distances, and of elevations, and all the variations on the same days were within the figures given. On other days, and under favorable circumstances, the elevations run a little lower. The elevations given express the angle over the horizon.

Fifth. "What was the weight of the projectile?" Ans. 550 grains.

Sixth. "What kind of rifle was used?" Ans. Remington "Creedmoor," calibre .44. ALEXANDER SHALER.

[We omitted to mention in our abstract of the original report that the Hazard FG powder was used in these experiments.—ED.]

A GRAND SCHUTZENFEST.—The Sharp Shooter's Union of the United States announce that their general meeting and prize shooting will be held at the Philadelphia Schutzen Park from June 26th to June 3d next. In connection with the same a rifle match between teams representing organized rifle clubs will be held on July 6th next. A similar occasion for a general gathering of riflemen from all parts of the country, as that offered by the Centennial celebration can hardly be expected in a life-time. Rifle associations and friends of the art of shooting everywhere are, therefore, cordially invited to partake in those contests either as competitors for or donors of prizes to be shot for.

In order to enable the Committee to determine the value and number of the prizes, to be shot for at the match on July 6th next, rifle clubs who intend to participate in the contest are requested to give a previous notice of their intention as soon as possible, and to make their entry by May 15th next, as provided in the programme. Rules of the Sharpshooters' Union, and the shooting programme, which our space will not permit us to publish in full, will be forwarded, on application, by the Secretary, A. von Lehman, No. 534 and 536 North Third street, Philadelphia.

—The Joint Committee of the National Rifle Association and the American Rifle Club will hold a meeting at No. 93 Nassau street, to-morrow, at half past three P. M., to consult further in the matter of arranging for the Centennial and international rifle contests.

CONLIN'S GALLERY.—The gold medal made and presented by Messrs. Tiffany & Co., as the first prize in the tournament now being held at the above gallery for the benefit of St. John's Guild, is a very handsome affair and will be warmly contested for.

The following is the list of prizes, making in all seventy-eight of various values from a gold medal to a hard rubber pencil:—

One St. John's Guild Medal. Made by Tiffany & Co., Union square.
One silver medal. Presented by James S. Conlin, 930 Broadway.
One silver cup. Presented by Geo. W. Plati, 4 Liberty place.
One gold pin (model R mington rifle). Presented by Richard Oliver, 11 John street.
One pearl handle, gold and silver plated and engraved revolver. Presented by E. Remington & Sons, 281 and 283 Broadway
One bust of Washington. Presented by Wilson McDonald, corner Thirty-fourth street and Broadway.
One Orvis click reel (silver plated). Presented by Eaton & Co., 17 Ann street.
One shooting cap. Presented by Dunlap & Co., 175 Fifth avenue.
One tan rubber shooting coat. Presented by Goodycar India Rubber Manufacturing Co., 205 Broadway.
One box fine segars. Presented by Sandy Spencer (Live and Let Live), corner Fulton and Broadway.
One year's subscription to FOREST AND STREAM. Presented by Forest and Stream Publishing Co., 17 Chatham street.
One year's subscription to *Rod and Gun*. Presented by the publishers, 23 *Park* Row.
Sixty hard rubber pencils. Presented by Austin G. Day, Equitable Building.
Six economic blacking brushes. Presented by Towle Manufacturing Co., 30 Courtlandt street. Total prizes, 78.

CREEDMOOR, JR.—Another Insurance Match was contested at this gallery on Saturday last between teams from the Continental and New York Insurance Companies. The result is shown in the appended score:—

CONTINENTAL.

Name.	Score.	Total.
W. Ellsworth	4 4 4 4 5 3 3 4 4	39
G. H. Hope	3 5 3 3 4 3 3 5 4 3	36
W. E. Ernest	3 3 4 3 3 3 3 4 3 4	34
Lloyd Roberts	4 3 4 4 4 2 3 4 4 2	34
J. W. Oakley	3 2 3 2 3 4 4 4 3 4	33
W. Townsend	4 2 4 3 2 4 5 2 3 3	37
Total		303

NEW YORK.

Name.	Score.	Total.
V. C. Field	4 4 4 4 5 3 4 4 4 4	40
C. N. Pontez	4 3 4 4 4 4 4 4 4 4	38
H. C. Richardson	3 3 4 2 3 4 3 4 5 5	37
C. A. Davenport	4 5 4 5 2 4 4 2 2 4	36
G. Denston	3 4 4 1 2 4 0 3 4 3	30
L. Fosdick	3 2 0 0 2 4 2 4 0 3	20
Total		201

MILEY'S GALLERY.—The following record was made last week in laying down position at this gallery:—

Name.	Total.	Name.	Total.
Col. B. E. Valentine	50	J. W. Wallis	49
M. Sheppard	50	R. Simpson	49
John Kirkaid	50	M. Sheridan	48
F. B. Holton	50	W. Hall	46
R. P. Morle	49	George Glendonning	17

The above shooting was done at 100 feet, at targets reduced in proportion to Creedmoor. Shooting at 100 feet in laying down position even at a target reduced to the proportions of a Creedmoor long range target is simply absurd. The conditions of shooting are totally different, and we see neither rhyme nor reason in the practice.

The following is a record of last week's shooting off hand:—

Name.	Total.	Name.	Total.
John F. Burns	48	H. Fisher	44
H. A. T. Schon	47	J. O. Wright	44
R. P. Morle	46	T. J. McCabe	44
J. H Stearns	44	F. P. Pike	43

GLEN DRAKE.—The final competition for the Association Cup took place at this range on Thursday last. Mr. David F. Davids was the winner of the trophy with a score of 40. Highest possible score 50. The next highest scores were: R. Rathbone, 37; H. Fisher, 37; Col. J. T. Underhill, 30; J. R. Grohmann, 30, and Major J. W. Coburn, 28. The early part of the day was not propitious and accounts for the poor scores. The scores in the Subscription match were much better; the best were as follows:—

Name.	Score.	Total.
R. Rathbone	5 5 5 5 5	25
H. Fisher	5 4 5 5 4	23
D. F. Davids	4 5 4 5 5	23
J. R. Grohmann	4 4 4 4 4	20
Col. J. T. Underhill	5 2 5 4 3	19
Maj. J. W. Coburn	3 3 4 2 5	18

THE INTERNATIONAL MATCH.

HAMILTON, Ontario, March 18th, 1876.

EDITOR FOREST AND STREAM:—

I gather from the published correspondence that the awkward position in which the proposed International Rifle Match at present stands is owing chiefly to the ambiguity of the wording of the invitation issued by the National Rifle Association of the United States. In the invitation it is proposed to have a series of matches in which the riflemen of all countries are asked to participate, the principal match being for the championship of the world, between teams of eight men from each country. I believe that the invitation is meant to convey the idea that there will be no restriction as to number or residence of the competitors in the matches open to individuals, but that there shall only be one team from each country or nationality. Assuming this view to be correct, and in view of the fact that separate invitations were forwarded to Scotland and Ireland, the invitation sent to the National Rifle Association of Great Britain could only apply either to the individual competitors solely, or to them and a team from Great Britain generally, for the National Rifle Association of Great Britain have no power to act for the riflemen of England alone, and consequently until further action is taken England has no separate or distinct place amongst the nationalities invited. The telegram sent to Sir Henry Halford could, I think, only tend to complicate matters still further, for owing to the separate invitations, it would have permitted two teams each from Ireland and Scotland, whilst Sir Henry Halford had no authority to act for either of these nationalities.

In a letter published in the last issue of the FOREST AND STREAM it is stated that the Dominion of Canada has accepted the invitation, though I am informed that the Dominion of Canada Rifle Association has received none, and consequently cannot have accepted it. I fear and regret that the ambiguity referred to will cause the same confusion here as in Great Britain, and that through it Canada will not be represented in the principal competition.

I have before me one of the circulars addressed to the "Ontario Rifle Club, Hamilton, Canada," (which, by the way, does not exist, and never has existed), in which it is desired "that your *country* should be represented." I presume that similar circulars have been addressed to various rifle associations in Canada, and yet the only one authorized to act on behalf of the Dominion has apparently not been communicated with. I regret to differ with those whose opinions I value highly, but I certainly think that the position taken by Sir Henry Halford is the correct one, in fact, the only one open to him, and that the National Rifle Association of the United States should, instead of continuing a diplomatic correspondence which must end unsatisfactorily to both parties, take the initiative in placing matters upon a more satisfactory footing.

J. J. MASON, Captain Thirteenth Battalion.

CALIFORNIA.—A match was shot at the range of the National Shooting Club near San Francisco on the 11th inst., arising out of a challenge issued by Messrs. Hentz, Carson, and Willett, members respectively of the National, Summer, and Union rifle clubs, to shoot any three members of the Second Brigade at 200 yards, with the Springfield rifles. The challenge having been accepted by Messrs. LeBreton, Nash, and Burgan, was shot as before mentioned, and with the following result, 40 shots being fired by each man:—

HENTZ, WILLET AND CARSON.

Names.	Points for Shots.	Points.	Total.
A. H. Hentz	4 3 3 4 5 4 3 4 4 3	37	...
	3 4 4 4 5 3 3 3 4 3	36	...

Game Bag and Gun.

GAME IN SEASON IN APRIL.

Wild duck, goose, brant, &c.

GAME IN MARKET.—The ducks have about all left Southern waters and are scattered along the coast, *en route* for their Northern breeding grounds. Our markets are now supplied principally from Long Island, and for a week or two to come the Great South Bay, Barnegat and Shinnecock will be the favorite shooting grounds for gunners. Canvas backs we quote at $2.50 per pair, but they are the remnant of the refrigerated birds; braut are now very fine, and sell for $1.50 per pair; wigeon, black ducks and broad bills are abundant, and retail for from 50 cents to $1 per pair, according to condition; wild geese, $1.25 each; wild pigeons, $2.50 per dozen.

NEW YORK—*Syracuse, March 27th.*—Mr. Henry Gale, of Liverpool, Onondaga county, recently shot thirteen ducks and two geese in one afternoon on Seneca River, near Onondaga Lake. The bag was an unusual one for this vicinity. SENECA.

Messrs. Eaton & Thompson returned on last Saturday from Good Ground, Shinnecock Bay, Long Island, where they had a day's shooting under the management of William Lane. They brought back with them 10 broadbills, and represent that they left 25,000 behind on the bay. Geese have commenced their Northern flight, but few have been killed as yet. During next week the shooting is almost certain to be good at Shinnecock.

MASSACHUSETTS—*New Bedford, March 25th.*—Sea fowl, black ducks, &c., are very abundant. The schooner yacht Mary Chapin arrived yesterday from a gunning cruise, with over 200 sea fowl. CONCHA.

MARYLAND—*Snow-Hill, March 26.*—The season for snipe shooting has fairly begun on the salt marshes. Mr. Pinchin, of Philadelphia, bagged twenty on Wednesday. Should the weather continue mild, good shooting may be had during next week.

—Wild pigeons are plentiful along the shores of Lake St. Clair, Canada, and also in many parts of Pennsylvania, but very few, however, are coming into our markets. We can place 1,000 or more live birds at a fair price.

PIGEON MATCHES.

—The members of the Long Island Shooting Club assembled in force on Friday, the occasion being known as their "Cup Day." The conditions of the competition are 25 yards rise, 80 yards boundary, 1¼ ounces shot, and club rules to govern, the last winner being penalized two yards. There were thirteen entries—Messrs. Wynu, Hance, Walters, Gildersleeve, Talbot, Burritt, Madisou, Hartshorne, Baylis, Wingate, Eddy, Kane and Remsen, all at the stipulated rise, as Mr. Thomas, who won the cup last month, was not present, being in Kentucky, five birds were shot at instead of the usual number of seven. The winner proved to be Mr. Wynn, who cut down all his birds in good shape, and he was awarded the honors of the occasion. Eddy, Talbot and Burritt killed three; Gildersleeve and Hartshorne each two; Walters and Madison one, while Baylis, Wingate, Hance, Kane and Hartshorne missed all. The club are arranging their grounds so as to admit of a 200 yards rifle range. They also employ officers to prevent outside skirmishing for missed or wounded birds.

—Messrs. Jos. J. Snellenburg and Wm. M. Boyle, both of New Brighton, Pa., shot a match at the club grounds at New Brighton, March 8th, for $50 a side; seven single birds each, 21 yards rise, 80 yards boundary, Capt. A. W. Townsend, referee, which resulted in favor of Mr. Boyle by the following score:—

Name.	Score.	Total.	Name.	Score.	Total.
Wm. W. Boyle	1 1 1 1 1 1 1	7	J. J. Snellenburg	0 1 1 1 0 1 1	5

—A match was shot at Newcastle, Pa., March 17th, between James Patterson and Geo. Ray, of Newcastle, and Geo. Woodruff, of Rochester, Pa., for $150, the best score to take the money. The conditions of the match were 25 single birds each, National Rules to govern. Mr. Woodruff won by the following score:—

Name.	Score.	Total.
James Patterson	1 1 0*0 1 1 0 1 1 1 1 1*0 1 1 0 1 1 1 1	18
George Ray	0 0 1 1 1 1 1 1 1 0 1 1 1 1 0 1 1 0 0 1 0 1	wt'dn.
George Woodruff	1 1 1 1*0 1 1 1 1 1 1 1*0 1 1 1 1 1 2 1 1*0 0*0 1 1	20

*Dead out of bounds.

CALIFORNIA.—An exciting match was shot on the 17th inst. at Harbor View, near San Francisco, between Messrs. Robinson and Kennedy, the stake being $500, and the conditions, 60 birds, 30 single and 15 pairs. The result was as follows:—

Single birds, 21 yards rise.

Name.	Total.	Name.	Total.
Robinson	1 1 1 1 1 1 1 0 1 1 1 1 1 1 1 0 1 1 1 1 1 1 1 1 1 1 1 0 1 1 1 1	Kennedy	1 1 1 0 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1	28

Double birds, 18 yards rise.

Name.	Total.	Name.	Total.
Robinson	11 11 10 11 11 11 10 11 11 11 11 11 10 11 10	Kennedy	11 10 10 10 10 10 00 11 10 11 11 11 11 11 11	22

Robinson winning the match and money by two birds.

PHILADELPHIA, March 21th, 1876.

EDITOR FOREST AND STREAM:—

The quarterly match for the club medals of the Kensington Hunting Club were shot off on Wednesday, March 22d, 8 birds, usual conditions. There were 18 members shooting:—

Name.	Total.	Name	Total.
H. Scheuringer	5	J. Gindole	2
F. Widmayer	3	Charles Hebding	4
Charles Metzger	5	Wildam Deisroth	2
F. Magee	3	G. Somneck	4
F. Bolger	7	D. Gieb	2
M. Blind	3	M. Brierly	6
T. X. Burkle	3	S. Wm. Stees	6
Charles Hang	5	F. Bechmann	3
L. Holzschneider	7	F. Deseroth	6

The ties were shot off. F. Steiger, 1st; M. Brierly, 2d; and Charles Metzger, 3d medal. FR. D.

MILWAUKEE, Wis., March 25th, 1876.

EDITOR FOREST AND STREAM:—

Yesterday was the regular practice day of the Milwaukee Rifle Club. The weather looked very unpromising when we started out, and by the time the shooting began a storm of snow and sleet from the northeast set in upon us, blowing directly in our faces, making it difficult to see the target at times. The shooting was done from our cottage, through the open window, at the 200 yards range, and considering the circumstances the result was fair, as the following score will show:—

Name.	Total.	Name.	Total.
S. F. Williams	39	E. J. Fielding	35
W. B. Skelch	38	J. C. Welles	33
C. N. Smith	38	J. Johnston	28
C. Turner	36	C. T. Hawley	37
E. D. Bates	35		

The club is invited to shoot in Chicago on Thursday next, and it is hoped that they will achieve a creditable record for the Cream City.

WAU WAU.

TORONTO, March 27th, 1876.

EDITOR FOREST AND STREAM:—

The following gentlemen have been the successful winners of the monthly prizes offered by the Toronto Gun Club, as far we have shot:—

Month.	Name.	Birds Killed.	Shot at.
January.	W. Bigg	9	10 pigeons.
February.	Dr. Smith	14	15 snow birds
March.	G. Wright	10	15 "
April.	D. Ward	9	15 "
May.	R. Ardagh	8	15 "

The snow birds are caught by Mr. W. Lean and shot at by the club on his island, Don Flats, and afford grand sport every Saturday. No less than from fifteen to twenty members participate in the matches.

R. S. W.

THE STATE SPORTSMEN'S CONVENTION.—A correspondent writes apropos of this event:—

"The next convention of sportsmen will take place at Geneseo the coming spring, and the indications are now that the birds—12,000—will be procured near at hand, probably Pennsylvania, as food is plenty and they are preparing to nest. The Dean Richmond Club, of Batavia, offered as the leading prize what was called the "Dean Richmond Cup," which has been won by the Buffalo Club twice and the Syracuse Club once, but this meeting will probably decide its destination. But it will be a toy, comparatively, to the "Wadsworth Cup," to be offered as a prize by Mr. James Wadsworth, the President of the State Association. Three delegates from each club contest for the cup, and are entitled to twenty birds each—Central City Club, Syracuse, 46; Onondaga Club, Syracuse, 42; Geneseo Club, Nondequoit, 38; Forresters, Buffalo, twice winners, 42; Monroe Club, of Rochester, 40; Audubon Club, Buffalo, 37; Phœnix Club, Seneca Falls, 43. The conditions: To be won by one club three times. Of course your paper will be represented and welcomed by every sportsman. ED.

WATERFOWL SHOOTING AT BARNEGAT.

NEW YORK, March 17th, 1876.

EDITOR FOREST AND STREAM:—

Having just returned from my semi-annual visit to Capt. Cox's Club House at Barnegat, N. J., in pursuit of waterfowl, and knowing that many of your readers will be interested in knowing the results, I will give you a sketch of my excursion: Leaving Pier 8, North River, at 4 P. M. last Saturday, I arrived at Waretown in four hours, where I remained that night, and next morning sailed to Capt. Cox's, seven miles across the bay, which was made in less than an hour. Here I found my guide, Joseph Ridgway, one of the crew of the Life Saving Station, expecting me, and as the weather had been heavy, with an easterly wind for the past three days, he predicted that the next morning the wind would set in from the northwest, and we then might look for good shooting for geese and brant. After an excellent supper, I retired, and was called by the Captain next morning, and told that breakfast was ready; so having dressed warmly, and drawn on my Hombird suit, and breakfast dispatched, found the rain coming down but we were soon in our

wo sneak boats, making our way to the point selected as the basis of perations. The weather soon cleared up, and the northwest wind blew ard and was intensely cold. We found that the birds kept shy of the and, but in the open bay thousands of geese, brant and ducks were eeding, and here they were secure. The fowl that we shot were at long range, and they came up in line, and we found they would not unch, and I had a fair opportunity to test my new 10 bore, breech-loader, recner gun, weighing 13¼ pounds (modified choke-bore), and I am confident that a better piece was never brought to shoulder. As this was ny first trial with it, I discovered that 4¼ drachms powder (Dupont's) nd 1¼ oz. B.B. shot was not enough, and hereafter I shall use 5¼ or 6 rachms powder and 1¼ oz. B.B. shot. I also used Ditmar's powder, and elieve that, on small game, it answers very well; but I cannot recomend it for large game. All the birds I shot were cleanly killed, and s I was desirous to try the gun on very long range, my guide fired both arrels at a single brant goose, then far off, and winged it. I took deberate aim, and with the moderate load in my shells heard the shot rike him, and he dropped dead. The distance must have been at least 20 yards, and the guide said it was the longest shot he had ever seen, nd he thought it impossible to kill at any such distance. I may add hat there was no perceptible recoil to my gun, and that in every respect s performances excelled any gun I had ever come across. Never can he "oldest inhabitant" remember such quantities of fowl in the bay. shot hut one day, and the result was 4 Canada geese, 20 brant geese, nd some ducks brought home.

Tuesday morning I sailed to Barnegat with a head wind, and was told hat ten days previous a man working in a field while it was foggy, and himself surrounded by wild geese and brant, that had lost their ay trying to follow up a small stream; but he was not armed and the irds alighted on some of the buildings.

I happened to be at the shooting grounds at the right time, but every onter of waterfowl knows that it is a lottery. One reason for poor ccess among waterfowl this season is owing to the very mild winter, as he birds have been able to remain at the North and feed, and also the ut that all along the coast, at intervals of three miles, are life-saving ations, with an average crew of six to eight men, who have much lei- ure, are sportsmen, have boats and decoys, are fond of shooting (and best shots they are), and who otherwise would lead a very monotonous ail life, and they use the birds as a delicacy for their tables, or send em to market; but coast shooting cannot be expected to be good, nd any but strange birds to come to the decoys after having to pass rough such a "fiery ordeal" every three miles the whole length of the oast.

J. C. F.

SOME NOTES FROM ILLINOIS.

ROCKFORD, Ill., March, 1876.

EDITOR FOREST AND STREAM:—

We began last week, during the few warm days, to look for the ap earance of ducks, pigeons, etc., but just now the ground is covered ith snow, and the approaching spring seems as distant as it did a month ago. Our river was once the resort for ducks and geese on their ight from south to north, and south to south, but they have given it the go by" for several years, and which we seek ducks we must go abroad. nce the river was "full of fish." It was no trouble to catch a fine ess before breakfast within the city limits, but those old times have eparted, and the angler must look to other streams for sport. Everybody (nearly) goes a fishing here.

Rockford is noted for its clubs. There are three, two of which, the ippo-links and Waltonians, are quite large clubs, and have been in existence several years. They own ground, club houses, etc., at Twin akes, Wis., and flock thither in the fishing season in large numbers for ecreation and enjoyment. They take with them usually a fine band of usic, and dance and feast, as well as fish.

The Forest City Club has been recently reorganized, under the new ame of the "76 Club." The membership is limited to fifteen, and is already about full. They have procured a charter or certificate from the ecretary of State, and are now a legally constituted corporation. This lub, last season, purchased a tract of land and erected a convenient and ommodious club house, at Delevan Lake, one of the handsomest small akes in Wisconsin, that "State of lakes." One needs but to glance at map of the State of Wisconsin, dotted all over with lakes and streams, o know that it is a great resort for anglers; but to fully appreciate its atural advantages, a tour of inspection is necessary.

The Wisconsin Legislature has recently appropriated $10,000 toward tocking lakes and streams, and when good laws are enacted and enforced for the protection of fish and game, that State will be even more han now a paradise for anglers and sportsmen.

In a recent number of the FOREST AND STREAM you advise some one o go to Koshkonong Lake for spring duck shooting, but upon reflection ou will remember that duck shooting is prohibited in Wisconsin in the spring—is not allowed, I think, until Sept. There has also been a law assed prohibiting the use of sneak boats and batteries. A very just aw, too, for there is ample opportunity for even the novice to secure a ood bag, in the season, in a legitimate and sportsmanlike manner.

NIMROD.

GAME IN MARYLAND.

EAST NEW MARKET, Md., March, 1876.

EDITOR FOREST AND STREAM:—

I write you a few lines to let you know what kind of a country we have for hunting, with a description also of a hunt I had last fall with me friends. Dr. John Everhart, with his dog June; Frank Jacobs, ith his dog Roma and bitch Flora; George Hooper, with his bitch ose, all of West Chester, and Dr. George P. Jones, with his bitch ora, of East New Market, Md., and myself with dog Veto, constituted a party. We started for a hunt, and as I have for many years devoted uch attention to the sport, and raised and broken many first class setter dogs, was glad of course to join so pleasant a company. All agree with me that this is a nice country for hunting; its surface being level, he can ride sixty or seventy miles and not find over twenty-five feet ise or fall, with sufficient timber to protect game, among which I will ame rabbits, opossums, squirrels, red and gray foxes, geese and ducks, cluding the canvas-back), quail, woodcock, snipe, and water rail. eason for quail, from the 20th of October to the 20th of January. Rail hooting is fine, 160 having been killed on one tide. Fox hunting is a vorite diversion, Mr. M. J. Smith and George A. Thompson of this lace, claiming to have the champion dogs for speed. It is nothing uncommon to kill three red foxes in one day with the same pack of dogs, nd not shoot them, there being a fine of five dollars to shoot a fox ead of a pack of dogs. A chase after a red fox generally lasts about wo hours, though they are often caught in one-half the time, and ometimes even in one-half hour. Foxes often seek a hollow tree for a iding-place from dogs, not having high banks to hole in as in some tates farther north of us. In the fall of the year, say the 1st of Nov., have shot 225 squirrels in two weeks with no assistance, using to hunt em a small dog, a cross between the terrier and beagle hound, making o finest of all squirrel dogs. They make but little noise, not alarming e squirrel, and causing it to run high up the tree, the dog treeing by ght, sight, etc.

Situated as we are on a peninsula, we are most favored with handome rivers, bays, and creeks, abounding in all the delicacies that grow the waters, such as oysters, sand clams, and crabs, (hard and soft ell), and fish, among which I will mention the shad, rock pickerel, rch, herring, etc. In the banks and marshes are found muskrats, and ften mink and others. I must not forget to mention salt water terrapin and snappers in large quantities. Fruits of all kinds flourish here, re particularly the peach, in the greatest luxuriance, besides the aller fruits, which grow very abundantly. So you see, if we are scarce f money, we will not starve. In the hunt referred to above, the famous dog Greely, considered by all judges the fastest setter on record, the famous bitch Sappho, now in pup by Greely, from which we expect a fine lot of dogs, Dr. E.'s June, F. J.'s Roma and Flora, G. H.'s Rosa, R. M.'s Harry and Tom, Dr. J.'s bitch Cora, now in pup by the famous Gordon setter dog belonging to Rev. J. T. Lassell, of Easton, Md., each possessing qualities making them very desirable. All filled admirably their part. Last but not least I will mention Veto, which I consented to let friend Valentine take to his home in the mountains of Pennsylvania to hunt pheasants, being a remarkable dog possessing all the qualities combined in a bird and duck dog.

The winter has been unusually mild, and we anticipate much game the coming season, hope in after years to meet the same friends, with others, in the hunt and sport, and that the FOREST AND STREAM will flourish like the green bay tree on the banks of the river.

JOSEPH K. BRAMBLE.

INDEPENDENCE, Virginia, March 10th, 1876.

EDITOR FOREST AND STREAM:—

A fox had recently been visiting our sheepfolds and poultry houses, an objection to which was instantly raised by the house keepers and good matrons of the neighborhood, so I concluded to give him a friendly visit, and the sly fellow had been out too late, for Music, Damar, Dinah, Willie, and Tough Bevan to give a free and too welcome note for his benefit. In a short time they had him running, and he soon made for a field of cut down pines on the farm of S. Lowe, J. P., whose lambs he had taken a hearty meal of a few nights before. This little pack pressed him so hard he had to leave his cover and they run into him in an open field on the farm of H. Noles, Esq. From find to finish was about twenty minutes by the watch, and as hard running as any fox hunter wishes to hear or ride after. At the kill there were present Captain Evans, owner of the hounds, Mr. Keys, Mr. Lynn, and the two Messrs. Kinchelows. The pace was too fast for the balance of the company, but they arrived in time to partake of the hospitalities of Mr. Lynn and lady, who had every luxury required by a fox hunter after a run. We returned to our homes quite content, hoping the next fox we start may run an hour or two instead of twenty minutes. When the fox was picked up from the hounds you could see disappointment in the faces of the followers in his short but glorious run.

OLD MARK.

New Publications.

We have received from Mr. D. H. Eaton, of Peotone, Ill., a little pamphlet known as "Fred's complete List of Home and Foreign Sporting Journals," the object of which is to furnish a complete handbook of reference for sportsmen. It contains the name, address, and subscription price of every sporting publication, American and foreign, and also a directory of dealers in sportsmen's supplies, and a list of the principal sporting books, where they may be obtained, and the cost.

ORNITHOLOGICAL CHARTS. We have received from the author, Mr. Greene Smith, of Peterboro, N. Y., a series of six charts which he has constructed, showing the classification of the birds of the New World, and one chart of the larger divisions of Old World birds. They are of two sizes, one about twelve inches by nine, and the other more than twice as large. The author's method is similar to that pursued in making a genealogical tree, he having grouped about a central white circle the Class Bird, with which they are connected by lines, as many dark green circles as there are Sub-classes; about these, in a similar way, Orders in purple circles. Sections in yellow, Families in carmine and Sub Families in emerald green, each group connected with its central circle of the next higher rank. Substantially this same plan is followed out in analyzing each of these divisions, until the genera and species are all indicated in their true relations according to the classification of Prof. Liljeborg. In addition to this, certain signs are printed upon the circles, besides the name, indicating the comparative height of organization and comparative size of the species in a given group; denoting the portion of North America in which the bird occurs, and its degree of abundance. These charts are very plain and very pretty. They would be useful to the student of ornithology as an aid to memory, but their chief utility will lie in the class-room, where the short time usually allowed to that study makes such artificial and pictorial means of acquiring a general knowledge of ornithology almost indispensable to both pupil and teacher. The charts appear to be very free from errors in following Liljeborg's system, which is the one adopted at the Smithsonian.

—Mr. F. S. Webster, of Troy, N. Y., has sent us some colored stereoscopes similar to those made by Hurst, which have had so large a sale. They are taken from natural objects, and are strikingly life-like. Mr. Webster is a naturalist and taxidermist, and he has taken a very attractive method to impart a knowledge of our birds and animals.

MAGAZINES.

The Scientific Monthly. The March number of this magazine, which is published at Toledo, Ohio, brings it to No. 6 of Vol. I. It seems to sustain its character, and some improvements are noticed, as the addition of a department of Geography and Travel. The leading article is an excellent account of the Coot by W. H. Machin, which is illustrated by a full page cut. Another large illustration is given of the whip-poor-will, with accompanying description. J. Manfred Kerr contributes a thoughtful article on "Ocean Currents. The Question of the Day," by which the contest between religion and science is indicated, is discussed by W. C. Chapman, M. D. Briefer articles upon "The Bermuda Islands," "Nature's Music," "Grasses," and "Infusoria" complete the contents. The magazine appears to be well conducted, except that it lacks the vivacity which can only come from original knowledge. There is a large field for such a monthly, and its success ought to be insured.

—A good story, never before published, about Judge Roseknans, has been told to the Whitehall *Times*. A party, against whom the judge once rendered a decision, wrote him a saucy letter, and wound up by asking what could be done in the case. Judge Rosekrans wrote as follows:

Dear Sir: Yours received. In reply I would say that two ways suggest themselves to me.

First, You can appeal. This is generally hazardous, but oftentimes very effective

Second, Damn the judge. This is inexpensive, but sure to afford immediate relief.

—If onions are sliced and kept in a sick room they will absorb all the atmospheric poison. They should be changed every hour. In the room of a small pox patient they blister and decompose very rapidly, but will prevent the spread of the disease. Their application has also proved effectual in the case of snake bites.—*Exchange.*

—The germinating of seeds is favored by a partial exclusion of light from the surface soil for a few days. Newly sown beds may be covered with moss or mats, or even newspapers. The exclusion of the rays of the sun, and the retention of moisture hastens the germination of the seeds.

—On the 6th of February a troop of wolves attacked a party of twenty-four persons near Moscow, Russia. Only one person escaped, and that one by the swiftness of his horse.

Yachting and Boating.

RULES OF THE NEW YORK YACHT CLUB.—Some of the changes in the by-laws and sailing regulations of the New Ynrk Yacht Club, made at the last general meeting are important. It is no longer compulsory on yacht owners to fly the club flag when cruising outside of Long Island Sound and New York Harbor. The right to copy models of yachts is now restricted to owners alone, instead of builders, as formerly. It is now provided by chapter 26 that yachts when passing each other shall exchange salutes, either by dipping their colors or firing a gun, the junior craft to salute first. A new rule in chapter 27 defines the inside and outside courses to be used in regattas, the former being altered so as to make the finish below the Staten Island bluff. The outside course is so arranged as to take in a spar-buoy, with red and black horizontal stripes, moored about one and a half miles off the land and bearing south-southeast from the Highland lights, distance four miles, as a last turning point. By adopting this course the expense of a steamer is rendered unnecessary, and the sole extra expense will be that required for a stake-boat at the starting point.

Rule No. 2 of the sailing regulations allows only half the time allowance specified in the table to yachts below 7,000 cubic feet of measurement. Rule No. 6 repeals the rule requiring a deposit of money upon the entrance of a yacht for a regatta. Rule No. 10 removes the limitation in the number of men to be carried during a race. By an alteration of Rule No. 17, yachts are permitted to take in or discharge water previous to a race.

—The new schooner yacht being built by subscription at Coburg, to represent the Canadian Yacht Club at the centennial regatta, is rapidly approaching completion. She will be about the size of the Palmer, 96 feet on the keel, 107 feet on deck and 114 feet over all. She has a beam of 24 feet and depth of hold 9 feet 6 inches. Her draft aft will be 6 feet 6 inches, and forward 3 feet, and, with centre board down, she will draw 19 feet. From deck to hounds her mainmast is 65 and her foremast 62 feet.

—The New Brunswick Yacht Club have chosen Dr. C. Morrngh, Commodore; J. C. Scott, Vice Commodore, and A. J. Jones, Secretary and Treasurer. J. Nicholson and S. Felter are Trustees.

CENTENNIAL MATCHES.—The following is the programme arranged by the committee for the Centennial matches:—

The undersigned, a committee appointed by the United States Centennial Commission to manage a series of international regattas, open to yachts of all regularly organized clubs, to be sailed during the yachting season of the present year, have adopted the following programme:—

FIRST DAY—Thursday, June 22d.—A regatta over the New York Yacht Club course, open to all yachts, of above, of fifteen tons and upwards.

SECOND DAY—Friday, June 23d.—A regatta in New York Bay, open to all yachts, as above, of fifteen tons and under, over a triangular course not exceeding twenty-five miles.

THIRD DAY—Monday, June 26th.—A regatta from New York to Cape May, and return, open to all yachts, as above, of fifteen tons and upwards.

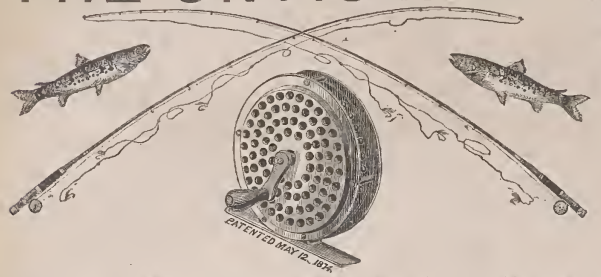
In the first and second regattas yachts will be divided into classes, with time allowance based upon the mean length and breadth. In the third there will be two classes for schooners and one for sloops, without allowance of time.

A certificate of measurement must accompany every entry. The owner's measurement will be considered sufficient, unless protest is made. In each case the committee reserve the right to remeasure.

The medal and diploma of the International Exhibition of 1876 will be awarded by the United States Centennial Commission to the winner in each class in the above regattas. Additional prizes in silver will be awarded by the undersigned committee. All entries must be made to the committee on or before Thursday, June 15th. All communications must be directed to the Secretary of the Committee, S. Nicholson Kane, New York Yacht Club, Twenty-seventh street and Madison avenue, New York city.

Committee—George S. Kingsland, Commodore New York Yacht Club; John S. Dickerson, Commodore Brooklyn Yacht Club; John M. Forbes, Commodore Eastern Yacht Club, Boston; S. Nicholson Kane, Vice Commodore New York Yacht Club; William L. Sw n, Seawanaka Yacht Club, New York; William T. Garner, New York Yacht Club.

BOATING AT HARVARD.—There are eleven men now in training for the eight-oared race with Yale, to be rowed June 30th. It is said that their average size is smaller than has formerly been the case, but they are in better training. During the winter the candidates have pulled each day an increasing number of strokes on eight hydraulic "rowing machines." Exercise on the Charles will begin as soon as the water will permit. There will not a man step into the six-oared shell until after the eight-oared race with Yale. After that race the first six men in the Harvard boat—counting from stroke—will step out and fill the places in the six. Three weeks will elapse between the Harvard-Yale race and the Association races, and in that time Harvard expects to get her men well "seated" and in easy condition. In the six-oared boat the steering is done in the bow, in the eights by a coxswain.



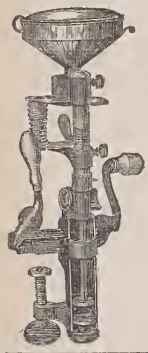
JAMAICA POND BOAT CLUB.—The following officers have been chosen for this club for 1876:—President, Austin G. Gorham; Treasurer, T. B. Ticknor; Secretary, E. L. Lincoln; Directors, George W. Hastings, W. P. A. Brewer and Wendell Goodwin. The club now has fifty members, ten single sculls, ten double sculls, ten four-oared skulls, three barges and fifteen pleasure boats. They intend giving a series of regattas this summer on the pond, and its members are now in their gymnasium, working hard and running eight miles a day.

—Mr. J. Russell, of the Atlantic Boat Club of Hoboken, has been elected Commodore of the New Jersey Amateur Rowing Association.

—Holton (Kansas) teacher.—"Where does all our grain product go to?" Boy.—"It goes into the hopper." "Hopper! what hopper?" "Grasshopper," triumphantly shouted the lad.—*Ex.*

NOW READY.

THE ORVIS REEL.



No 1.—This Reel is extra nickel-plated and finely finished. Is perforated to make it light, and keep it free from sand, also that the line may dry without removing it from the reel after use. Has a very perfect click. It is very light, very strong, and holds from 40 to 50 yards of line. It is more compact and less cumbersome than ordinary 20 yard reels. It is quite narrow, and takes up line rapidly. Put up in neat Black Walnut Case, price $5.

No. 2—For Prizes. Same style as No. 1. Heavy Gold Plate. Extra finish, with case, price $10.

Sent by mail, postage prepaid, on receipt of price, or by express, C. O. D. LIBERAL DISCOUNT TO THE TRADE. Send for Price List of Fishing Rods and Reels. Mention this paper.

GUNPOWDER.
Dupont's
SPORTING, SHIPPING AND MINING
POWDER.
DUPONT'S GUNPOWDER MILLS
(ESTABLISHED IN 1801),
Have maintained their great reputation for 75 years.
Manufacture the Celebrated
EAGLE DUCKING, EAGLE RIFLE, AND DIAMOND GRAIN POWDER.
The most Popular Powder in Use. Also,
Sporting, Mining, Shipping and Blasting Powder
Of all kinds and descriptions.
For sale to all parts of the country. Represented by
F. L. Kneeland,
Feb 10-1y 70 Wall Street, New York.

The Hazard Powder Co.,
MANUFACTURERS OF
Gunpowder.
Hazard's "Electric" Powder.
Nos. 1 (fine) to 5 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. *only*.
Hazard's "American Sporting."
Nos. 1 (fine) to 3 (coarse). In 1 lb. canisters and 6½ lb. kegs. A fine grain, quick and clean, for upland and prairie shooting. Well adapted to short guns.
Hazard's "Duck Shooting."
Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6½ and 12½ lb. kegs. Burns *slowly* and very cleanly, shooting remarkably close, and with *great penetration*. For field, forest and water shooting it ranks any other brand, and it is equally serviceable for muzzle or breech loader.
Hazard's "Kentucky Rifle."
FFFG, FFG, and "Sea Shooting" FG, in kegs of 25 12½, and 6½ lbs, and cans of 5 lbs. FFFG is also packed in 1 and ¼ lb. canisters. Burns strong and *moist*. The FFFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard *Rifle* powder of the country.
SUPERIOR MINING AND BLASTING POWDER.
GOVERNMENT CANNON AND MUSKET POWDER; ALSO SPECIAL GRADES FOR EXPORT, OF ANY REQUIRED GRAIN OR PROOF MANUFACTURED TO ORDER.
The above can be had of dealers, or of the Company's agents in every prominent city, or wholesale at our office.
88 Wall Street, New York.

CELEBRATED
American Dogs.
Fine Engravings on card boards, ready for framing, of the following celebrated dogs:—
Pure Laverack Setter Pride of the Border.
Pure Laverack Setter Fairy.
Imported Red Irish Setters Dash and Bess.
Red Irish Setter Dick.
Celebrated Dogs Peg, Don, and George, after painting by Bispham.
Black Pointer Whisky.
Liver and White Pointer Ranger.
Black Pointer Pete.
Price 25 cents each, postage paid. Address
FOREST AND STREAM PUB. CO.,
17 CHATHAM STREET, N. Y.

Orange Sporting Powder.
ORANGE LIGHTNING POWDER,
The *strongest* and *cleanest* Powder made. Nos. 1 to 7, packed *only* in sealed 1 lb. canisters. The coarser sizes (higher numbers) especially are recommended to owners of fine breech-loading guns, giving great penetration with very slight recoil.
ORANGE DUCKING POWDER,
For water fowl. Very strong and clean. Nos. 1 to 5. Packed in metal kegs of 6¼ lbs. each, and in canisters of 1 and 5 lbs.
ORANGE RIFLE POWDER.
The best for rifles and for all ordinary purposes. Sizes F.g, FF.g, FFF.g, the last being the finest. Packed in wood and metal kegs of 25 lbs., 12½ lbs., and 6¼ lbs., and in canisters of 1 lb. and ½ lb.
All of the above give high velocities and less residuum than any other brands made.
BLASTING, MINING, AND SHIPPING POWDER OF ALL GRADES AND SIZES PACKED IN WOOD OR METAL KEGS OF 25 LBS.
SAFETY FUSE AND ELECTRICAL BLASTING APPARATUS.
LAFLIN & RAND POWDER Co.,
21 Park Row, N. Y.
Sole proprietors and manufacturers of the celebrated ORANGE brand of GUNPOWDER. Recommended and used by Capt. A. H. BOGARDUS, the "Champion Wing Shot of the World."

CHALLENGE.
The undersigned is prepared to prove all the superior qualities he claims for his powder.
Safety, Cleanliness, Strength, Little Recoil, Little Smoke, Small Report, Less Heating of the Barrel in Rapid Firing, and its Regularity in Shooting.
He challenges all riflemen to shoot against him with black powder, 200 rounds, without wiping; 100 rounds off-hand, at 200, 500 and 1,000 yards respectively, and 100 rounds in any position at same distances; the 200 rounds equally divided at the three ranges; sighting shots extra.
Will shoot for money if desired.
The powder is also well adapted for shot guns.
Inquire for the "Dittmar Powder" of your dealer, or address the
DITTMAR POWDER MANF'G CO.,
mch 16 NEPONSET, MASS.

PISCICULTURE.
The West Barnstable (Mass.) Hatching Works are offered for sale. The various ponds and tanks are abundantly fed by springs unvarying in temperature. Six acres of land, dwelling house, a large ice-house, etc., etc., within five minutes' walk of the depot. Three thousand adult trout, and 20,000 fry of this years' hatching. A more complete establishment is not to be found in the country. It received the first prize of $300 from the Massachusetts Agricultural Society in 1872, and a medal from the Societe d' Acclimation, of Paris, in 1873, for "Excellent Fish Farm." Apply to

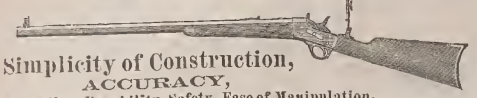
BUY IT Vanity Fair.
It is shaved from the best Natural Leaf, for Meerschaum and Cigarettes. Does not make the tongue sore. Sample on receipt of 20 cents. Highest award, Vienna, 1873. Send for circular. WM. S. KIMBALL & CO.,
FEERLESS TOBACCO WORKS, Rochester, N. Y.
From Seth Green, Supt. N. Y. State Fisheries.
I find Vanity Fair to be the best article of tobacco adapted to the wants of the sportsman. Have used your tobaccos for many years, and know them all to be first-class.
For Sportsmen.
A trusty friend, in weariness or trouble; a solid resource in Winter and rough weather, is a sweet pipe with Vanity Frir. Best dealers have it.
From A. B. Lamberton, Rochester.
Having smoked your tobacco, Vanity Fair, by the camp fire and by the hearth, I believe it in point of fragrance and taste superior to all brands known to me. Being in search of a tobacco that would not fire the tongue and mouth, I was made acquainted with your Vanity Fair, and found it to be the *ne plus ultra* of natural leaf.
For Cigarettes.
A cigarette is an interlude to the serious habit; a graceful make-believe for spare hours. For cigarettes Vanity Fair has no equal. Best dealers have it.
From Forest and Stream, N. Y.
We have received from Messrs. Kimball & Co., of Rochester, some choice specimens of their celebrated Vanity Fair tobacco in neat metal cases holding a pound each; and, after most thorough trial, do not hesitate to concede to it all the good qualities which its manufacturers claim for it. It is a most superior article, and a great comfort to discriminating smokers.



THE
PAPER STEM PIPE.
Just the Thing for Home and Camp Use.
Supplies a want which smokers have long felt—a pipe which shall give simply the taste and odor of tobacco smoke. This pipe never accumulates rank smelling liquid in stem or bowl, but is always clean and sweet. The bowl and mouthpiece are permanent, but the stem is of porous paper, to be laid aside after a few days' use and a new one fitted. Extra stems accompany each pipe. The price of extra stems, when not furnished with the pipe, is as follows: Four and a half and seven inches, 5c.; twelve inches, 10c. Sold by pipe and cigar dealers generally, or a complete sample sent by mail for $1 by

Paper and Metallic Shells
FOR
Breech Loading Shot Guns,
Manufactured by the
UNION METALLIC CARTRIDGE CO.,
BRIDGEPORT, CONN.

THE STURTEVANT SHELLS are the easiest reloaded. Do not have to unscrew the head nor use an awl to remove the exploded caps. THE PATENT MOVABLE ANVILS, made of steel wire, will not bend or break.

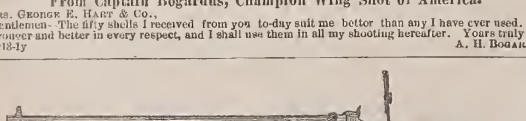
THE BERDAN PATENT SHELLS, new model, with Hobbs' patent waterproof primers, never miss fire, and are highly prized by all that have used them.

PAPER SHELLS.—By repeated experiments and great outlay for improved materials, and machinery made expressly for the purpose, we can now warrant our BROWN PAPER SHELLS equal to any imported. They are sure fire, and will not burst in the gun.

Inquire of any of the dealers in sporting materials for the U. M. C. Co.'s Shells.

Not sold at retail by the manufacturers. dec23 tf

Hart's Sportsman's Favorite Metallic Shells for Breech Loading Shot Guns.



These Shells are easily loaded, and the caps easily extracted from inside. Head solid, and much thicker than any shell now made, giving a solid seat for cone or anvil, which prevents it from driving through or spinning away, thereby causing misfires. The cone is made of nickle and fastened solid in its place. It will not rust or corrodes fast like moveable anvil made of steel. The nickle cone also prevents misfire when cap has been left on shell for a few days, which is liable to occur either in steel or iron. These shells are finely finished, and made any length ordered, from 2½ to 3½ inches.

Shells and Loaders, and description Price Lists, can be obtained from all the leading sportsmen's houses throughout the country. GEO. E. HART & CO., 363 and 365 Market st., Newark, N. J.

From Captain Bogardus, Champion Wing Shot of America.

MESSRS. GEORGE E. HART & CO.,

Gentlemen—The fifty shells I received from you to-day suit me better than any I have ever used. They are stronger and better in every respect, and I shall use them in all my shooting hereafter. Yours truly,
A. H. BOGARDUS.

CHAMPION GUNS OF ENGLAND
PAPE'S
Unrivalled Sporting Guns.
Stand unequalled in every contest. Their performance at the London Trials of 1875 beats the records of any maker in the world.

1875. 12-Gauge, Choke Boring.

Maker of Gun.	Exhibitor.
1st—Grenner	Greener.
2d—Pape	Davidson.
3d—Pape	Pape.

Out of a class of 68 guns, 3 out of the 6 best were made by Pape. The Greener gun was protested against on the spot for having its score false counted, the fact proven there, and afterwards confirmed by same gun being shot for two days per week for six weeks in succession, when its average score only took 24th place, its very best score being greatly below the score of the best six guns.

1875. 12-Gauge, Old Sporting Bore.

Maker of Gun.	Exhibitor.
1st—Pape	Davidson.
2d—Pape	Davidson.

1875. Long Range, 60 yards, Choke Bores.

1st—Pape	Davidson

60 yards, Long Range, Sporting Boring.

1st—Pape	Davidson

Those champion Long Range guns, only 7 pound weight, with a charge of 3½ dr. to 1¼ oz. shot, beat the best 8 bore Greener gun at 60 yards; weight, 15 lbs.; 6 drachms and 2½ oz. shot.

1875. The Sportsman's Sub. Cup, valued at £45, was also awarded to W. R. Pape, for the original invention of choke boring. Winner of the London Gun Trials of 1858. 1859, 1866. Address

dec2 tf NO AGENTS.

H. C. Squires, No. 1, Courtlandt st. New York.
THE GREAT
London Gun Trial,
1875.

W. W. GREENER'S
Far-Killing Prize Guns.

Winner of Silver Cup, value 40 guineas. Winner in Class 1, for 8 and 10 bores. Winner in Class 4, for 20 bores. Winner in the Wear and Tear Trials, July, 1875. 2,500 shots fired without deterioration.

W. W. G. is the only maker who has made an average pattern of 214 shots in a 30-inch circle, at 40 yards, with a 12-bore gun, at any public trial either in England or America.

I have just received a consignment of these guns, and shall offer to individual sportsmen, for a short time, an opportunity to secure one of these celebrated guns at a popular price, viz: $75, gold; extra for extreme close shooting, $10. This will probably be the last chance to secure one of these guns at these very low figures. All grades and styles in stock or imported to order.

Attention is also called to my stock of guns, by W. & C. Scott & Sons, which includes all their latest improvements. No old style guns in stock.

Sole New York Agent for Holabird's Hunting and Fishing Suits. Trade supplied.

Send 25 cents for large Illustrated Catalogue of Guns, and including Game Laws for all the States, and summary of Great London Gun Trial. Ready March 1st. jan13 1y

WILLIAMS & POWELL,
Gun and Rifle Manufacturers,

Call the attention of the Sportsmen of America to the extreme SIMPLICITY, STRENTH and DURABILITY of their New Patent "SIMPLEX" Breech loader and INDEPENDENT EXTRACTOR.

The parts in this new action are so few (only two,) its mechanical soundness so thorough, and the strength and simplicity of the action so great, that W. & P. feel sure it will supercede all the complicated and manifold grips now in use, its one powerful grip being far stronger than any double, treble or quadruple grip now used. In this new action LEVER and GRIP ARE ONE SOLID PIECE OF STEEL and the ANGLE of the BODY is left in its ENTIRE STRENGTH.

Drawings of action and extractor will be sent on application, and orders may be forwarded through any of the best houses in the States for execution in the Spring.

Guns guaranteed to make patterns of from 160 to 200 with No. 6 SHOT AT 40 YARDS, as desired.

DUNCKLEE'S CAMP STOVES. Price $15.

Those desiring something light and durable for camping purposes will find this stove exactly right; weighs only 25 pounds; will cook for ten persons. The ware consists of Kettle, Tea Kettle, Coffee Pot, Fry-pan, round Tin Pan, two square Pans, Dipper, Gridiron, Tent Collar, and eight feet Funnel Stove Pipe, with oven that will roast 15 pounds beef, all of which nests and packs inside of stove, which only occupies a space of 12x12x20 inches.

CAMP LOUNGES. Price $5.

When folded is about the size of an ordinary shawl strapped. A light, durable, compact, and comfortable couch. Sent by express C. O. D., $5, including side and supporting sticks at the head. Just the thing for the camp or lawn.

CAMP TENTS,

for four persons, 7. 6. square, weighs 15 lbs.; Can be packed in knapsack. Price $10. Ten feet square for six persons, $15.

American Dog Biscuits,

Made of nutritive bone and muscle making material, and is the only portable food for dogs made in this country. Put up in packages of 10, 25, and 100 pounds, and warranted not to spoil in any climate. Price, 10c. per pound.

Jack Lamp,

for night shooting and fishing, running rapids, lighting camp, etc.; the best light ever invented. $6 25.

THOMSON'S FISHING AND HUNTING SUITS, best quality of water-proof duck; light tan color, especially adapted for concealment in blinds or sedge grass, or for approaching game in the woods. Light, durable and very cheap. English style; extra pocket in back for cartridges. Entire suit, $15.

BOND'S METALLIC BOATS.

Hart's Metallic Shells.

The best shell ever offered to sportsmen. All sizes on hand and made to order.

"The Ampersand."

COLVIN'S CANVAS BOAT.

The most complete portable boat constructed. The largest size weighs but 12 pounds. Can be packed in space of less than half cubic foot. Prices within reach of all.

No. 1, 8 feet, weight 8 pounds..... $25 00
No. 2, 10 feet, weight 10 pounds..... 32.00
No. 3, 12 feet, weight 12 pounds..... 40.00

Third Edition.

Camp Life in Florida.

By CHARLES HALLOCK,

AUTHOR OF THE FISHING TOURIST.

This is a most seasonable book for Sportsmen, Tourists, Invalids, and Settlers, and has been long needed by Winter tourists to Florida and persons seeking settlement there. It gives a full classification of the game and fish of the Southern Peninsula, routes of inferior and coastwise travel, the agricultural resources of the country, and sites for settlement, hints for camping out, resorts for game, hotels, and such other information as will be of great benefit to visitors seeking Florida for health, pleasure, exploration, or permanent settlement.

348 pp., 12mo. Price, $1 50.

CONTENTS:

Introductory Chapter.
Birds-eye Glance at Florida.
Outfit for Sportsmen.
Hints for Southern Hunting.
Coasting Routes of Travel.
Game Animals and Birds of Florida.
Game Fish of Florida
Three Months in Florida for One Hundred Dollars.
Supplementary Hints for Cheap Recreation.
Up the St. John River.
Indian River.
Florida the Promised Land.
Fort Caproa.
Fishing at St. Augustine.
Black Bass Fishing on Spruce Creek.
Hunting the Panther.
The Environs of Tallahassee.
Private Dougherty and the Bass.
Pet Birds of St. Augustine.
Steam Yachting on the St. John.
Among the Semineoles.
In the Cypress Swamps.
Cruising Along Shore.
Shooting at Salt Lake.
The Okeechobee Expedition.

SOUTHWEST FLORIDA.

No. 1—Fernandina to Cedar Keys.
No. 2—Manatee Sarazota and Gasparilla.
No. 3—Among the Keys.
No. 4—Meteorology.
No. 5—Punta Rassa and Caloosahatchie.
No. 6—Up the Caloosahatchie River.
No. 7—Visit to Okeechobee.
No. 8—Indian Mounds and Canals.
No. 9—Tampa.
No. 10—Subterranean Streams.
No. 11—A Sportsman's Paradise.
No. 12—Suggestions to Tourists.

Overland Notes.

NUMBER FIVE.

FROM Mr. Link's Ranche we set out for an excursion to the more remote and unfrequented mountains of the Tarryall Range, whose red peaks were seen distant against the northern sky. Our outfit of tent, saddles, provisions, tools, and guns were stowed in a strong wagon, and your correspondent found a comfortable seat on a pile of fur robes and camp blankets. Our horses were not rapid, but were selected for their hunting qualities, steadiness, surefootedness, and willingness to be shot from. A vehement use of condensed vernacular, the vigorous use of two whips, and some remarks that might in the distance have sounded something like a negro camp exhortation, at times roused them to a display of "action," and for a few rods produced a speed of a mile in fifteen minutes; but as we journeyed northward, and gained elevation, several inches of snow covered the road, and we were obliged to be patient and spend a good deal of time upon each mile, amusing ourselves as best we could with stories and hunting adventures.

Mr. Link's experience was very varied, and covered hunting of all kinds, from "birds" in Missouri to grizzly bears in the coast range of California; and his knowledge of the haunts and habits of animals rendered his detailed stories interesting to an unusual degree. As we made our slow way our route passed between two ranges of hills, where, Mr. Link said, elk were in the habit of crossing in their migrations from the wilds west and north of South Park to the ranges lying about Pike's Peak, and to the southward. While pointing out their route he drew up his horses and jumped out to examine carefully some tracks crossing our road, which he immediately pronounced to be elk trails, made, he thought, by a large doe and two well-grown calves. As they were fresh signs, we concluded to follow them, and turning from the road we drove by the trail until it left the bottom land and went among rough ground, when we left the wagon with Mr. Link's nephew, and with our guns carefully loaded set out upon the trail, which in the snow was very plain. It led us upon a long ridge, rising gradually. The ground was stony, with small thickets of quaking asp and stunted pines. Upon this quaking asp the elk feed at times, cutting a piece of the smooth bark like a blaze mark, by an upward cut of their lower teeth, and these marks half healed over are seen all about, evidence that not long ago this noble game was abundant indeed.

After a mile we found we were gaining upon the game before us, the tracks were fresh, and the animals were evidently wandering about seeking a place to lie down, and now moving most guardedly, we scanned eagerly all the half-open woodland, feeling that any moment a bit of brush might prove to be antlers, or a seeming mossy stone the body of the coveted game. Stealing along we came where the animals had been lying down, and the snow was still moist from the warmth of their bodies. Beyond doubt the wind, which was provokingly wrong, had conveyed to their keen nostrils warning of our approach, and they had sprung up just beyond our view, not much alarmed, however, as they did not run, but walked along, with the evident intention of resuming, in a more secure spot, their mid-day rest. The trail wandered about, but kept down the wind, as these cunning brutes do when wary, that if followed the wind shall bring them its warning. Further on they turned up the ridge, and upon their track, and here beyond doubt they were again alarmed by our passing them on the direct trail, for after stalking from bush to bush when their ruse was expected, we came upon bold and rapidly-made tracks, that told of fear and flight. This trail we still followed, hurrying on, out of breath in the thin air, and weary enough from our more rapid pace on the trail which followed along the north side of an abrupt mountain, where the snow was deep, and fallen trees and huge stones gave most uncertain footing. "A stern chase is a long chase," and forces upon one in such a struggle a strong impression of man's feebleness as set "on end," combined with boots that slip, clothes that catch, weighted with gun and ammunition he flounders along, making in half an hour of breathless work the summit his fleet, four-footed quarry has gained in a few long bounds, to find with disgust that another point rises higher, from the lofty summit of which his game may be quietly watching his slow progress, ready, if need be, to bound off again. One wishes for the wings of an eagle, or the sure feet of a wolf, or that the elk would just carry one's gun a mile or two and lean it against a tree, and so divide the labor. Struck by the very certain amount of work, and the equally uncertain chance of a shot at the game now really alarmed and on the *qui vive*, I concluded to abandon the hopeless chase. Mr. Link thought he might, by running on—a proceeding hardly any other mountaineer would attempt in the rarified air—gain a long shot; so he set off on a run, and disappeared amid snow and rocks, while I set off on a line to our wagon, stopping for a while to make a fire and rest and dry my clothing, which was wet from perspiration. Reaching at last our camp fire, where Mr. Link arrived at the same time, I found his efforts had been rewarded only by a sight of the elk passing over a distant hill, when he, too, abandoned the hunt—one where our chances had been frustrated by an unfavorable wind.

Disappointed, we turned into the road, and resumed, after wasted hours, our slow route, too late to reach our destination. After a few hours, admonished by darkness and falling snow, we concluded to seek shelter in a cabin, whence came in response to our halloa, a bright glow of light from an open door, where a rotund *silhouette*, stood the form of a kindly Dutchman, who bid us welcome, and said "come in." Bumping my head on a low lintel, I entered the cabin, and rubbing my eyes, looked upon as queer a den as I ever saw—low, roofed with huge logs, and illuminated by a pitch pine fire that blazed high in one corner, where the angles built of stone formed a rude fireplace. Bending over the fire was an old man with wild hair and beard, resembling to the life the grim figures in Restebes outline sketches of the Liniebumms. This grotesque figure, I learned, was Henri, "the dirtiest man in Colorada," but withal kindly and far from unintelligent. His hut was not far away, and was not famed for neatness. In it poor Henri was at one time very ill, and at last a doctor was summoned some forty miles for counsel. The medical man came, opened the door, looked in, but entered not. From the open air he pronounced his prescription, "wash yourself, clean your house, and you'll feel better," and remounting rode away. Henri got well, but whether he tried the remedy is not known. If he did, his water cure treatment was not long continued.

In the hut of our friend we passed the night, lying before the fire, and naturally rose early, and at dawn were on our way, despite a continued fall of snow, that made miles long and hours weary. Our road was over a series of summits, each higher than the last, with deeper snow and more violent storm, until at last we were obliged to walk and break a path, through which our beaten horses dragged the wagon a rod at a time. So thick were the fleecy flakes that it was not safe to get any distance apart, and for a long time it seemed as if we must get under some rock or tree and remain until the storm should abate. After a long pull we reached a farm house—a most snug one—when we gladly abandoned any effort to go beyond while the storm raged. The night came on with cold wind, and the following morning was bright and fine, and we were early on our way. The snow was lying light and pure, and as we went along we read on its surface a record of all the movements of animals. A stream, Tarryall Creek, half frost-bound, was on our right, and to drink from it many animals had come down from the mountains early in the morning after the storm. Here were the prints of rabbits and hares; again, creeping under the cliffs, two or three wolves had been. From almost inaccessible ledges wild cats and lynxes had sprung down, starting balls of snow that rolled along leaving pretty prints in the white surface. Amid a clump of bushes was recorded the life struggle of a "cotton tail" and a weasel, in the trampled snow were the frantic footprints of poor puss in her efforts to shake off her deadly foe, and the groove where she had pulled the slender form of the "varmint" whose fangs were in her throat. At another point, a "cotton tail" had been surprised away from his sheltering rocks by an eagle, whose swoops he had evaded by bounds from side to side, until all the snow was beaten down. The low dashes of the bird were marked by the strokes of wing tips on the snow, as he headed off every dash of frightened bunny; but we were glad to see no fur or blood on the snow, and presumed the bird was baffled at last.

Three varieties of rabbits, or more properly hares, were seen, and a number shot from our wagon. The long-eared "jack," a wary fellow, wonderful in the awkwardness and rapidity of his flight, has some protection in being white in winter, as has the "snow-shoe" hare; but the plump little cotton tail remains brown, and is a victim to almost all predatory animals from man to weasels, while owls and hawks haunt his timid life. He sits in implicit stupidity in front of his rocky home, and is so easy to shoot that only his excellence in a stew warrants killing him. The snow told tales of other animals, who, independent of night keys, do ramble late. Big bucks had come with high, dainty step to drink; panthers (mountain lions) had stolen along with noiseless but not unrecorded footfall, and coyotes—fearful of all, but more afraid of starvation—had sneaked about, looking for some sick animal or timid hare for sustenance. A few birds braved the cold—mountain grouse, magpies, and jays—and their footsteps made patterns on the snow as regular and dainty as if embroidered.

All these abundant evidences of wild life, with Mr. Link's comments and explanation of their habits, made our third day's drive more agreeable, and not at all weary we reached his son's ranche before dinner, a daintly-served meal, where we were much pleased with the gentle and affectionate ways of a tame antelope, a pretty thing with superb eyes, that courted notice, and enjoyed it as much as a spaniel. Mr. Link's son Louis here joined us, and we went on and passed the night with Mr. B. Ratcliff, who has a very nice ranche, newly established. He is a very keen sportsman, and usually supplied his table by carrying his gun when going for his cattle. His success is unusual, as will be apparent when we state that in nine shots he killed eight fine mountain sheep.

An early start from Mr. Radcliff's took us to our camp ground by nine the next morning, and soon Mr. Link, his son, and I were mounted and *en route* for the mountains. Mr. Louis Link left us for a long route through the haunts of sheep and bison, we going among some rough peaks for sheep. Herds of cattle were feeding on the dead grass that came above the snow, but we were soon above their haunts and on the alert for sheep, the most wary and cunning of any mountain game. They live among the most precipitous ranges, and are fleet and surefooted where, seemingly, no feet could tread. Their gaze is usually downward, and rarely are they surprised, unless from some overhanging crag. Scanning every cliff and stone, we made our difficult way upward, our eyes protected by smoked glass from the danger of snow blindness, here very serious. Our horses labored hard, and barely kept their feet on the rugged slope. All at once Mr. Link slid from his horse and motioned me to do the same. Crouching low, and looking under the limbs of a pine, we saw two sheep on a rock some three or four hundred rods distant. Our horses were hastily tied together, and we crept up to the pine tree expecting a shot, but the wind played us false, coming up suddenly, and bearing our scent to the game, alarming them so that they fled before we were within range. We went on after them, hoping to get near them, and then let our dog (a Scotch collie) go, with the aim of driving them to some rocky retreat, where the dog would keep them; but when let slip he soon came back, showing they had gone a good way on. We took the trail and followed it to a high peak, where, but for the unfa-

vorable wind, we would have stalked them with success. As it was, we came almost upon them on an overhanging point, where they had stopped to overlook the valley where they had been alarmed. Again we followed them, but the snow was waist deep, and with the needle of my aneroid barometer down to about twenty inches, it was too rarified air for much hard work, and our rests were very frequent. Our trail led us among their retreats, where they had laid under overhanging rocks in the warm sun, or out on rocky shelves that were narrow, and from which the down look was hundreds of feet of dizzy precipices. These look-out points were hard to reach, but richly repaid the effort; for, spread far and wide, were the valleys and mountain peaks of endless chains. Near us huge domes of rock stood out from the mountain points, a thousand or two feet high; far away over the foot hills the South Park laid like a frozen lake, treeless and white, with a surrounding of sharp peaks, some brilliant in sunshine, others hidden by clouds and driving snow storms. The south slopes of these mountains were rock-ribbed, with bold cliffs and buttresses, all stern and grim, with hardly a shrub or tree. The north sides were black with a dense growth of spruce and balsam up to eleven or twelve thousand feet, where all vegetation ceases, and the mountain tops are bald and white with snow that is almost perpetual.

To such scenes do the mountaineers' steps lead in this beautiful country, filling one with pleasure, giving new surprises and fresh delights, as the kaleidoscopic changes of season, and light, and shade, pass over these eternal hills, affording fresh beauties to familiar scenes, urging one to new paths and fresh discoveries. Wandering here fresh vigor comes to every limb, weariness is forgotten, while the mind, filled with new and pure impressions, springs up from past depressions, and renews the power of keen enjoyment. Here on our own continent are rambling grounds worthy of an Alpine club, and scenes that one can never exhaust, all so open that a carriage can pass far and wide upon the plains and foot hills, and in the saddle almost any point may be safely attained. The game is certainly wary and not readily reached; but it is noble game, worthy of every exertion, and if the game bag often comes back to camp empty, the days are not wasted that are passed amid such scenes, and disappointments are not serious that are accompanied with new health and every sense made keen. Forced to abandon the now alarmed sheep, we scanned the mountain sides from commanding points for bison, elk, or sheep, but saw no more, so we made our way carefully to our horses and rode back to camp, where we arranged our tents, collected wood and laid down by the fire, listening to the wild animal cries, waiting for Louis Liuk's return. He came in long after dark, picketed his mule, and gave his report. He had been many miles, often above timber line, where he had to break a road for his mule through the snow, and came at last upon three fine bison; one he killed, a second was hard hit and left a bloody trail, which he had followed a mile, when night obliged him to return. This was cheering news, and after arranging to go in next morning for the slain, and perhaps for the wounded bison, we curled up in our blankets. L. W. L.

MY FIRST DAY'S PARTRIDGE SHOOTING.

BY FRANK FORESTER.

At last I was eighteen years old. I had been in the sixth form at Eton more than six months, had been promoted from round jackets to long tailed blue coats, the height and front of the Etonian's ambition, from a pony to a fifteen-hand thoroughbred hack, which I believed to be the best hunter in the island, and from my seat at my sister's governess' table to a knife and fork in the diniug-room, and now I was to be promoted from shooting rabbits, snipe, wild fowl, larks, and such animals of the half-game order, to the dignity of a game certificate and a license to kill game in my own right throughout England. I was already more than a fair shot, for it had been agreed between myself and the governor that I should be entitled to claim a game certificate so soon as I could kill nine out of the first twelve skylarks that should get up before me—the skylark, when he does not rise to sing, flying low, very swiftly, close to the ground, by no means unlike a snipe, and quite as difficult to kill.

This feat I had accomplished some three weeks before the first; my certificate was bought; my first shooting jacket built; my gun cleaned for the tenth time within the last two days; my shot-pouch and powder-horn filled, and I, filled full from head to foot with anticipation of distinguishing myself before the eyes of the governor, went to bed—but not to sleep, on the night of the 31st of August, I was awake and on foot at daybreak, and it seemed hours—many years to me—before my father made his appearance, rigged for the field, at about eight o'clock.

Well, to the field we went in the home farm, and within five hundred yards of the house; in a fine turnip patch, knee-deep among the broad green leaves, the dogs came to a point. I had made some trivial wager with the governor that I would bag my first bird—a dog whip or whistle, or some such trifle—but my heart was as much set to win as if a million had been at stake. Three young birds rose, two crossed the governor to the right, and both fell to his two-barrels, killed clean. My bird fell likewise, but he was wing-tipped only, ran, and was not retrieved. I had lost my wager, and my heart was heavy; the governor chaffed me and laughed at me. I grew nervous, got out of sorts, blazed right and left at everything. I carried both barrels at full-cock then—everybody did so in those days—missing it before it got five yards away; was quizzed and laughed at more and more, and came within an ace of being destroyed and rendered worthless as a shot forever. Suddenly, in a desperate situation I took a desperate resolve. I would never again, while I lived, cock a gun till the bird was on the wing at which I was about to fire. No sooner said than done. I let my gun down to the half-cock and proceeded. The next ten birds that rose I put up my gun to my shoulder without cocking it, pulled, no fire came, and I got quizzed more and more, and at last actually scolded, as if I were holding back my fire purposely, because I could not get what I considered a true aim. Then I was lectured on the beauties of a *first sight*, and on the inutility of picking after my birds, and of the danger of becoming a pottering shot, all of which I knew, every iota, as well as my monitor. But not a word deigned I in reply, either in defence or in explanation. At last I got the hang of it. I cocked my gun as I raised it, discharged it as the butt struck my shoulder, and of course killed my bird. I killed thirteen birds, one after the other, in unbroken succession, four of them double shots; then I missed one bird, killing its mate with my second barrel, and five more in succession; then two misses and eight kills, each after each. At nightfall I had bagged twenty-seven birds out of twenty-nine shots, after missing some nineteen or twenty shots without a single kill in the morning. I have never done much better since. That morning made me all that I claim to be at this moment—a *deliberately* prompt shot. But you had better believe, gentle reader, that from that day forth to this I have never cocked my gun till I have seen my game fairly on wing or afoot; and yet more, till I have let it go as far as I intend that it shall go at all. And I find that I can kill as many snap shots as most men. Let those who will, carry their guns cocked. I say *let them*, so that they don't carry their hammers down on the nipples, it is all one to me. If they do so, they don't shoot in my company nohow; but for my own use, give me the gun at half-cock and *deliberate promptitude!*

[ED. FOREST AND STREAM—The foregoing sketch, which I hope you wi.. republish in your journal, was originally written for the *Southern Military Gazette*, but never published in that paper. It was, however, published in a book called "Dog and Gun," which you have doubtless seen, although many of your readers may not.]

For Forest and Stream.

DUCKING ON THE CONNECTICUT COAST.

OUR sound, protected by Long Island from the billows and fierce breakers of the Atlantic, with its many quiet bays and inlets, its gently sloping, sandy shores and shallow waters, abounding in mollusca and small shell fish, is the favorite resort of countless numbers of water-fowl, from their first arrival from the northern breeding grounds, about the middle of September, until their departure again in April and May. The first species which arrives here in the early autumn are the surf ducks—a beautiful bird, glossy black, with a white patch on the top of the head and another on the nape of the neck, from which coloring it has received the name of "skunk head" from our gunners. Its mate, dressed in a sober suit of brown and gray, is called the gray coot, and is very generally considered an entirely different species. The ducks of this species which first arrive keep far out on the sound, and are daily joined by large flocks of their companions from the north. In a few days these flocks become of immense size, consisting of thousands, which are now joined by a few scooters. The duck shooters begin to prepare for the sport, and the boats are got out and left in the water for a few days that they may swell sufficiently to be perfectly water-tight. By the way, the boat we use here for duck-shooting is flat-bottomed, twelve to thirteen feet long and about thirty inches wide, decked over, and with a combing around the cockpit which is just large enough to accommodate one person. The white-winged coots and loons soon commence to arrive and mingle with the others, which have now moved nearer to the shore. Every morning these large flocks scatter, and in small numbers, from two or three to a dozen individuals, fly up the sound toward the west. They continue to fly in the same direction until about ten or eleven o'clock; all then settle, and scarcely any birds are flying until two o'clock in the afternoon, when all commence flying back again, the flocks being larger than in the morning flight.

Imagine a party of sportsmen just formed for the first shoot of the season. The boats are all collected on the shore near some favorite shooting ground, ready to start out the next morning at the very first streak of daylight. The party retire to some neighboring barn and beguile the long hours of the night with stories and joyous thoughts of to-morrow's sport; or, at home, roll uneasily in bed, longing for the next morning. No bell is needed to call them at the first signs of day. Many eyes have been eagerly watching for it. The boats now start out, so that all may be ready before it is light and the birds have begun to fly. Upon reaching the desired location, one man throws out his anchor, another rows about twenty rods beyond him and anchors also, and in this way the boats are all disposed of, reaching far out into the sound in a straight line. Golden streaks are fast springing up from the eastern horizon, lighting up the water, which is moving in long gentle swells, and the beautiful bluish haze, so characteristic of the cool autumn morning, with enchanting reflections. The ducks are now beginning to fly, and the noise of their wings, brought clearly over the water, sends a thrill through every gunner's nerves. The shooting will soon begin. There comes a pair of white-winged ducks, heading directly for the line. They must pass between some two boats, and every eye anxiously watches to see who shall have the first shot of the season. Nearer and nearer they come; they are almost up to the line, and now they notice the boats and partly stop, but it is too late for them to turn out. With swiftly moving wings, and with wonderful speed, one following about a foot behind the other, they attempt to pass between two of the boats. A man springs to his knees, the muzzle of a gun follows their swift course for an instant, a flash, a report, and a few feathers float in the air as the hindmost duck throws out its feet, drops its head, and with wings partly closed, turning slowly over in its swift descent, heavily strikes the water with a loud splash. The gunner now throws overboard the buoy to which his anchor line is attached, rows to the spot where the duck is lying dead on its back, lifts it up by one of its red feet, places it on the deck, and rows back. This is the first duck. And now the ducks are flying swiftly through different parts of the line, and the report of the heavy guns is heard almost every instant, if the ducks are flying well. Now and then some lucky fellow drops two at a shot. Many which are hit come down apparently dead, dive immediately on striking the water, and continue diving so vigorously that they often escape, the gunner not deeming it worth while to pursue them. Others which dive are never seen again. These are hard hit, and as a general thing cling to the weeds and rocks at the bottom with their bills and remain there till dead. If the bottom offers nothing to cling to they swim off with the body completely submerged, leaving nothing but the bill above the water. Sometimes after the warmth has all left the body of those which cling to the bottom, the muscles relax their hold sufficiently to let the bird float to the top of the water. Very frequently when a passing duck is shot at, the shot are plainly heard to hit it, but the bird keeps on as though nothing was the matter. Very soon, however, it moves its wings more stiffly, and inclines toward the water. This is a sure sign of a hard hit, and if it alights all right it can be easily knocked over with the other barrel. If the duck, on reaching the water, does not seem at all particular whether it alights right side up or not it will be found dead, though having flown perhaps for a quarter of a mile after being hit.

As the season advances, old squaws and shelldrakes arrive. The former are often allowed to pass through the line without being shot at, on account of their small size, swift flight, and extreme tenacity of life, making it so hard to get them after they are shot. As a general thing, however, everything is "game" which passes over the line, from a goose to a crow.

By the 1st of December all the varieties of ducks that we have are here, but most of the coots have gone south to spend a few weeks of the severest weather, and live shooting is given up, as all the other ducks except old squaws are usually too shy to pass over the line within gunshot, and the gunners resort to decoys and other devices for taking these wary ones. On the weed-covered rocks, bared at low tide, the black ducks particularly like to feed. Here the sportsman hides himself, with two or three dark-colored tame ducks, or wooden decoys anchored near him, and with a friend in a boat at some distance to pick up the ducks when shot. Bufflehead, broadbills and redheads can be decoyed easily, even if the gunner takes no particular pains at concealment, and they are usually shot from a boat, with decoys anchored a few rods off. The whistlers here can never be decoyed, and will very seldom notice the decoys at all; sometimes, however one will fly back and forth over the decoys, but always far out of gunshot. This seems rather strange, as in most places they are one of the easiest birds to decoy. I can in no way account for their singular conduct. Toward spring the coots return, and stay with us until the middle of April. The broadbills tarry very late, both species being found here until late in May. Besides being decoyed, the broadbills are frequently "toled in," in the same manner as the canvas-backs on Chesapeake Bay, by a trained dog running back and forth on the shore in front of the hunter's hiding place. To satisfy their curiosity as to what the dog is acting so for, they swim toward the spot with necks stretched up and eyes so intently fixed on the dog that the hunter can deliberately step out and give them both barrels before they spring apart. After the broadbills are gone, the "pensioners," or wounded ducks which are not able to fly north, and a few barren ducks, are all that remain. These are found here in considerable numbers, however, all through the summer, but are not molested except by the naturalist, who finds here an opportunity to procure them in their summer plumage.

N. HAVEN.

HINTS TO FLORIDA SETTLERS.

PENSACOLA, Fla., January 19th, 1870.

EDITOR FOREST AND STREAM:—

I have received so many letters this week making inquiries as to the healthfulness of different locations in Florida, that I am led to believe it a subject of general interest, and will give my opinion and experience for the benefit of your readers.

To begin with, I will say that, like everywhere else in this world, one cannot find *all* the good things collected together in one favored locality, even in Florida. If the land is a strong, rich hammock, the water is almost always poor, and fever and chills prevalent. If, on the contrary you locate upon pine lands, which will not produce over one-fourth as much to the acre as the hammock, the water is invariably good, and fever and chills, as well as other climatic diseases, almost unknown. There are localities scattered all over the State where one may live upon pine lands and cultivate a hammock within a convenient distance, but these locations are usually off the line of transportation. Upon the coast, whether on the east or west side, chills and fever are very uncommon. The shell bar mocks which are found here are not unhealthy; yet the mosquitoes and ants are apt to be bad on this kind of land. I would not build there, if it could be avoided.

There are many who visit this State each winter who are afflicted with lung diseases. To them I would say, avoid the coast, more especially the east side, for there they have cold, northeast storms, while upon the gulf side, while you go as far south as Charlotte's Harbor, the air is life bracing. Spend you time in the pine woods, and as much of it as possible out of doors. Above all, don't return north in the spring too soon. I know it is difficult to realize while here, in the midst of flowers and balmy breezes, that the same kind of weather does not prevail over the whole country. But I have known several to spend a winter here with great benefit, until thinking they are well, become impatient and go north in April, just in time to meet one of those cold, piercing storms of sleet and rain, and as their systems were entirely unprepared for such weather, they contract fatal colds. Remain until June, at least, and if a permanent cure is hoped for, remain through the year. The balsamic odor which is exhaled from the pines is more healing in summer, when the sun is flowing off the tree, than at any other season. I assure you that you will find the heat much less oppressive than at the North. The thermometer will not rise as high as at New York, and a sea breeze can be depended upon every day. Indeed, I think a Florida summer much pleasanter than a Florida winter, for we do have some cold days. When the thermometer drops to 40°, we suffer more than a person does at the North with it below zero. Our systems are not prepared for it, neither are the houses built to resist cold. There are always plenty of cracks for ventilation, as outside the cities it is very unusual to find houses lathed and plastered. I would also avoid the banks of sluggish rivers, for although the location may be very picturesque, fevers are apt to be prevalent. During the autumn of 1864 I was stationed at Magnolia, on the St. Johns. My camp was immediately on the bank of the river, on the bluff, two or three hundred yards south of the steamboat landing, under a beautiful grove of live oaks, draped with Spanish moss. The situation seemed perfectly delightful, yet out of the forty-eight men I had there, within less than a month thirty-four were down, one time with chills and fever, and before I was ordered away to St. Augustine two died of river fever. I have since been told to beware of settling where the Spa-

moss collects on the trees, whether on the river or elsewhere. At Stark, in Bradford county, where I lived over two years within a hundred yards of a large swamp, and where the whole face of the county is low and flat, and classed as "swamp lands," chills and fevers were unknown. The same could be said here of mosquitoes and house-flies, as we did not put up a bar during the whole time. Fleas are never troublesome where hogs and dogs are not allowed to sleep under the house; but as the natives usually permit this, I am not surprised that such vivid accounts of the enterprise and activity of the Florida flea have got into the papers from the northern sojourner.

There are places where I have found the mosquito bad. At Sarasota Bay, for instance, during the first summer of my settlement there, I lived upon the shell hammocks, which I cultivated, and mosquitoes were so bad from June to October that my wife could do no sewing in the day time, unless under a bar, and at meal times it was necessary to keep a smoke going under the table. We were forced to retire at sunset, and the mosquitoes were so small that ordinary netting was no protection; but we had to use a kind of cloth, called "Georgia check." While the mosquitoes were so bad on this hammock, by going back a mile or less into the pine woods, one could avoid them, and even on the hammocks they were "settled out." Such is usually the case; upon new places it is during the first year that all the drawbacks from insects occur. They may hold out in favorable localities through the second year, but the third will finish them. I have found mosquitoes troublesome in the day time only at the mouth of Tampa Bay, and at points south of there, and this during the summer months only. During the winter they are not numerous or troublesome, but it is at that season the fleas are in strongest force. The black flies of Maine and the Adirondacks I have never seen here. At Sarasota, if it was a perfect calm at sunrise or sunset, which was very seldom, there were sand-flies or midges, but a little smoke or wind would cause them to disappear.

I noticed in the Answers to Correspondents of the 13th inst., a statement that the white pelican was not met with in Florida. Please allow me to correct the statement, as during the winter we are visited by large flocks of the white pelican on the gulf coast, at every place south of Geoclote River that I have visited. They are perfectly white, except the tip of the wings, which is a purple—black, almost, in its intensity—and in size about twice the weight of the common brown pelican. They do not breed here, as do the brown, but come with the first "norther" in the winter, and disappear in March. Where they go to I have not been able to learn. Can any of your correspondents inform me where they breed? Hoping the above hints may be of service to some of the friends of FOREST AND STREAM, I remain, E. B. S.

DAVID CAFFIN'S GROUSE.—Dave Caffin, who keeps a boarding-house at Emigrant Gap, on the Central Pacific Railroad, is very hard of hearing—can hardly hear anything that is not shouted in his ear. Dave is very fond of hunting, and often takes his gun and prowls about the mountains in search of grouse, quail, and other game.

A Comstocker, who was snow-bound at Cisco for a day or two last week, tells the following story about Caffin:—He had been out hunting, and was going home with a grouse he had killed. As he came out of the wood and struck the railroad track he was overtaken by a stranger, who asked:—

"How far is it to Cisco?"

"Yes," said Dave, holding up the grouse, "I got one of 'em."

"I don't think you understand me," said the stranger. "I asked you how far it was to Cisco."

"Yes, he's pretty fat," said Dave, "he'll make a very good stew."

"You must be a darned fool!" cried the stranger.

"Certainly, certainly!" said Dave. "There's a good many of them flying about this year!"

Virginia (Nev.) Enterprise.

—Seth Green has gone to the Utica poultry show to spawn.—*Rochester Express.*

This is but a trifle worse than what the Utica *Herald* says when it calls Mr. Green the "father of fishes."—*Lockport Times.*

Well, we suppose the *Express* is re-spawn-sible for its assertion, if made of fish-ally.—*N. Y. Com'l Adv.*

What's Seth done to deserve such scaly treatment?—*Oswego Palladium.*

Done? Why the public! The fish lay the eggs, and Seth tackles over them. That's what's the matter ova there.—*Sutton Times.*

Gentlemen: you may try to checkmate Mr. Green, but just wait until he plays his pawn that you make so light of!—*Ex.*

Our contemporary talks about Mr. Green "playing spawn." Now, we have known of so-called sportsmen that amused themselves with fingerlings in this way, but who ever heard of an angler playing spawn? This is indeed going back to the egg.

CALLA LILIES.—Mrs. Rollin Smith, of Swanton, Vermont, writes to the Burlington *Free Press* as follows: "Since the notice in the *Free Press* recently of my possessing a continual blooming calla, I have received several letters from different parts of the State asking me for the treatment which produces such favorable results. I use a four-gallon jar, and give an eastern exposure. In the summer I keep it wet enough so the water may stand on the top, and at all times very wet. Once a year I take the plant, shake the earth from the roots, and fill the jar with earth taken from under old sod. As soon as a blossom commences to wither I cut it down, never allowing a flower to die on the plant. The result is in sixteen months I have had eighteen blossoms on the same plant, and at the present time it has two very large full blossoms."

—A cotton factor of Augusta, Ga., desiring to present a friend of his residing in Liverpool with a fresh specimen of Savannah shad, hit on a novel plan to carry out his wish. He went to Hale Barrett, the President of the Augusta Ice Company, and that gentleman carried out his desire by freezing two splendid specimens of the shad family in the centre of a block of ice weighing 165 pounds, which packing case they were shipped to England.

TAXIDERMY FOR PARENTS.—If you want to preserve your children do not stuff them.

Fish Culture.

THE NATURAL AND ECONOMIC HISTORY OF THE SALMONIDÆ—GEOGRAPHICAL DISTRIBUTION AND ARTIFICIAL CULTURE.

NO. SIX.

BY PHILO ICHTHYOS.

A CAREFUL study of the habits of the *Salmonidæ* leads to the conclusion that those portions of the northern hemisphere lying between the 33d parallel and the Arctic Ocean, which give origin to cool mountain streams, expansive lakes and rivers which flow into oceans, seas, and fiords, are inhabited by or capable of producing this interesting species. The salmon inhabits the coast of Europe from Spitzbergen to western France, and within these extremes are the richest salmon streams to be found on the globe. Norway, Sweden, and Denmark, Iceland and the Orkneys contain highly productive fisheries. England, Scotland, and Ireland also possess valuable salmon fisheries which produce large revenues to those who own or control them. France, Switzerland, Belgium, Holland, Prussia, Finland, Austria, and Russia have large salmon fisheries, furnishing vast quantities of wholesome and nutricious food to all classes. Nor have we yet enumerated one-half of the native haunts of this right royal fish. From Nova Zembla along the coast of Asia, to Bhering Straits, and southward to the sea of Japan the rivers of Asia are inhabited by this species. It is said by our Consular Agents, the coasts of Niphon and Yesso and the Japanese Islands—fairly teem with salmon, and that the Aleutian Islands, as well as the insular groups of the North Pacific Ocean, abound with this fish. In North America, from Newfoundland to the Pacific coast, and from the 33d parallel, north to the Arctic Ocean is a vast salmon area where this species already abound, or where there are congenial waters where they may be planted. In our country are many isolated streams, or water systems where brook trout are found in comparatively large numbers, while there are equally congenial streams near by that are uninhabited. Perhaps the following suggestions respecting the migratiou of trout, as well as other fishes, from one water system to another, may explain the colonization of fishes distant from where they seemed to have been indigenous. It has so fallen out in the economy of nature that two systems of water, forming distiuct basins, have originated near each other, the water shed between the sources of each being narrow and quite on a plane. Often during spring freshets the water sheds may become flooded so that the two sources *anastomose*, though but temporarily, admitting the trout which exist in one basin over into the other thereby giving a new species to the ichthyic fauna already existing there. We can conceive that all fishes may avail themselves of such an opportunity, as also might be furnished by overflows which unite basins in time of high water, and not at the sources of basins.

We annex a synopsis of the *salmonidæ*, giving the nomenclature of the different species as well as their geographical distribution. The synopsis is taken from a report of George Suckley, Surgeon United States Army, on fishes of North America, which may be found at length in the report of the United States Fish Commissioner, Prof. Baird, 1872 and 1873, page 91, *et seq*:—

I. From Nos. 1 to 6 inclusive, are anadromous salmon, species which ascend to fresh water rivers to spawn.

1. *Salmo scouleri*, Richardson. Hook-nosed salmon—Pacific coast.
2. *S. proteus*, Pallas. Hump-backed salmou—Alaska coast.
3. *S. cooperi*, Suckley. Cooper's salmon — Columbia River.
4. *S. dermatinus*, Richardson—Bhering Sea.
5. *S. consuetus*, Richardson—Yukon River.
6. *S. canis*, Suckley. Dog salmou—Columbia River.

II. From No. 7 to 18 inclusive, without red spots, not feeding in fresh water except from caprice.

7. *S. salar*, Linnæus. Common salmon—North Atlantic.
8. *S. quinnat*, Richardson. California salmon—West coast of United States.
9. *S. confluentus*, Suckley. Tawath salmon—Northwest coast.
10. *S. aurora*, Girard. Red char salmon—Columbia River.
11. *S. argyreus*, Girard—West coast.
12. *S. pauciden*s, Richardson. Weak-toothed salmon—Frazer's River.
13. *S. tsuppitch*, Richardson. White salmon—Columbia River.
14. *S. clarkii*, Richardson. Clark's salmon—Columbia River.
15. *S. immaculatus*, Stoner. Unspotted salmon—Labrador.
16. *S. gairdneri*, Richardson. Gairdner's salmon—Columbia River.
17. *S. truncatus*, Suckley. Short-tailed salmon—Columbia River.
18. *S. richardi*, Suckley. Richard's salmon—Frazer's River.

III. From 19 to 24, inclusive, the salmon are spotted with red; feeding freely in fresh water.

19. *S. campbelli*, Suckley. Campbell's salmon—Columbia River.
20. *S. hudsonicus*, Suckley. Hudson's Bay trout—Hudson's Bay.
21. *S. rossii*, Richardson. Ross' salmon—Arctic Ocean; Boothia Felix.
22. *S. hearnei*, Richardus. Coppermine salmon—Coppermine River.
23. *S. alpes*, Richardson. Long-finned char—Lakes of Boothia Felix.
24. *S. nitidus*, Richardson. Angmalook salmon—Lakes of Boothia Felix.

IV. Species not anadromous, nor running up from the sea, but living entirely in fresh water. (Trout). Red spotted or flecked with black spots; found in fresh, clear, cold flowing streams; feeding and spawning there spending the greater part of the year in the same; retiring to deep still water in the winter; access to salt water not disrelished nor indispensable. This note applies to No. 25 to 30 inclusive, brook trout of the Atlantic and Pacific slopes.

25. *S. fontinalis*, Mitchel. Brook trout of Eastern and Middle States.
26. *S. irideu*s, Gibbons. Pacific brook trout—California streams.
27. *S. masoni*, Suckley. Mason's trout—Columbia River.
28. *S. virginalis*, Girard. Utah trout—Utah and New Mexico, Southern Rocky Mountains.
29. *S. lewisi*, Girard. Missouri trout—Rocky Mountain slopes north of South Pass.
30. *S. brevicauda*, Suckley. Short-tailed trout—Puget Sound waters.

V. Trout found in deep rivers or lakes, ascending shallow streams to spawn; black spotted.

31. *S. gibsii*, Suckley. Columbia River trout—Columbia River.
32. *S. sebago*, Girard. Sebago trout—Sebago Lake, Me.
33. *S. kennerlyi*, Suckley. Kennerly's trout—Chi-lowe-yuck Lake, Frazer's River.
34. *S. warreni*, Suckley. Warren's trout—Frazer's River.
35. *S. bairdi*, Suckley. Baird's trout—Clark's Fork of Columbia River.
36. *S. parkii*, Suckley. Parker's River trout—Kootenay River, Rocky Mountains.
37. *S. oquassa*, Girard. Blue-back trout—Oquassa, Rangely Lake, Me.

VI. Lake trout passing their lives in deep fresh water lakes, approaching the shores annually to spawn in shallow water, never entering running brooks, or repairing to the sea to feed, or for the purpose of reproduction.

38. *S. namaycush*, Pennant. Mackinaw trout—Great lakes.
39. *S. confinis*, DeKay. Lake trout—Lakes of N. York.
40. *S. siscowet*, Agassiz. Siscowet—Lake Superior.
41. *S. symmetricus*, Prescott. Winnipisoogee Lake trout—New Hampshire.
42. *S. hoodi*, Richardson. Hood's salmon—Lakes of Atlantic Slope in Northeast Canada.
43. *S. newberryi*, Girard. Newberry's salmon—Klamath River.
44. *S. hucho*. Danube salmon—River Danube.
45. *S. orientatis*, Oriental salmon—Waters of Eastern Asia, Japan, and Alaska.

THE THYMALLI—GRAYLINGS.

1. *T. signifer*, Richardson. Arctic grayling—Lakes and rivers of Arctic regions.
2. *T. tricolor*, Cope. Michigau grayling—Cold streams of Northern Michigan.
3. *T. ontariocensis*, Valenciennes. Ontario grayling—In waters near Lake Ontario.
4. *T. vexillifer*, Nilsson. Europeau grayling—Waters of Central Europe.
5. *T. vulgaris*, Nilsson. Norway grayling—Waters of Norway and Lapland.
6. *T. gymnothorax*, Valenciennes. German grayling—Waters of Prussia.
7. *T. gymnogaster*, Valenciennes. Russian grayling—River Neva, Russia.
8. *T. Eliana*, Valenciennes. Swiss grayling—Lake Geneva.
9. *T. pallasii*, Valenciennes—Waters of Russia.
10. *T. mertensii*, Valenciennes—Waters of Kamschatka.
11. *T. grubii*, Dybrowsky. Grub's grayling—Streams of Siberia.
12. *T. thymallus*, Kroyer. Danish grayling—Waters of Denmark.

The generic name *thymallus* is derived from *Thymallos*, the Greek term for thyme, from the impressiou the Greeks had that the fish possessed the odor of this herb. Hence the Thymallii must have attracted attention from a very early period. In that part of the synopsis relating to the grayling, it is proper to state that Siebold, in his "Natural History of the Fresh Water Fishes of Europe," under *T. vulgaris*, includes *T. vexillifer*, *T. thymallus*, *T. gymnothorax*, and also inclines to refer *T. gymnogaster* to the same species; and further, Gunther is of the opinion that *T. gymnothorax*, as referred to by all authors, are one and the same species with the first named *T. vulgaris*—*vide* U. S. Fish Commissioners Report of 1872 and 1873, page 729.

When our enterprising fish culturists captured the Michigan grayling, this species was supposed to occupy but limited portions of this continent. But a little research discovers the fact that the grayling is as cosmopolitan as the salmon, and co-species exist in the Temperate and Arctic Zones of the Northern Hemisphere, wherever the waters are congenial to their habits.

C. albula—Waters of Russia.
C. maræna—Waters of Russia.
C. albus, Linne—Great Lakes.
C. angusticeps, Valenciennes—Lakes British America.
C. cluciformis—Interior lakes.
C. cousii, Coues whitefish—Chief Mountain Lake, eastern edge of Rocky Mountains.
C. fera—Lake Geneva, Switzerland.

To be continued.

—Referring to recent communications respecting the finding of smelts, or "frost-fish" in fresh as well as salt water, "H." (Ithaca, N. Y.) tells us that, although he has never seen the fish, the guides in "John Brown's Tract" catch in considerable numbers in rippling shallows, but only in October, fish which they call "frost-fish." They salt them down lightly, and export them as a dainty. They are never caught with fly or bait. Further information about them is desirable.

SHAD IN FOX RIVER.—A despatch from Appleton, Wis., dated March 26th, says: "Those interested in piscatorial matters will be pleased to learn that shad are being raised with success in this part of the State. Six shad, weighing about two pounds apiece, were caught in Fox river, just above this city, on yesterday In 1873, 200,000 spawn were put in the river by the State fish commissioners, and sport-men anticipate lively times in a few years.

DO INLAND FISH MIGRATE?

COLUMBUS, Ohio, March 20th, 1876.

EDITOR FOREST AND STREAM:—

I have been much interested in a correspondence between Mr. T. A. Logan, of the Cincinnati Cuvier Club, and Mr. Seth Green, relative to the utility of chutes or passags ways for fish. The correspondence grew out of the fact that Ohio has now, and for some years has had a statute compelling owners of mill-dams to construct chutes or passage ways for fish, and has made special appropriations for the construction of chutes around dams owned or controlled by the State. Although the statutes have been in existence for years, no chutes have ever been constructed under them, for the simple reason that no "person or persons" could be found in the State willing to construct chutes which they would warrant to insure the passage of the fish from below into the dam above. A bill is now before the Ohio Senate asking the obolition of these non-enforced statutes. Hence, Mr. Logan inquires of Mr. Green if chutes are really inutile, or whether any are efficient. Mr. Green is very confident that the chutes are very essential.

In making a report as Fish Commissioner, to the Governor of Ohio three years ago, I strongly advocated the construction of chutes, and read up all the literature I could find on the subject—read of the one at Mariotta, on the Susquehonna; at Holyoke, on the Connecticut; of the one described by Frank Buckland and others, and from this evidence took it for granted that they were absolutely necessary to enable the fish to go up stream. In April, 1874, I visited Marietta, Holyoke, and some other points, and was very much surprised to learn that no fishes were koowo to have passed up through these chutes. The citizens of Holyoke seemed somewhat out of patience with the folly which would appropriate $30,000 in building a chute which, when finished and fish put into it, the finny folks declined to ascend. Upon my return home I recommended the repeal of the fish chute law. I was met with the argument that, if the law did no good, it at least did no horm, and a day might come when its provisions would be called into requisition. To this I replied that when that day came a new and better law could easily be enacted.

It is a common notion that our inland fishes are as migratory as the shad or salmon; "in the fall they go down stream, therefore in the fall set your set-nets with the mouth up stream, and in the spring the fish go up stream, therefore set your net with the mouth down stream," is an old maxim to which all our fishermen subscribe.

While I am not prepared to say that inland fishes do not migrate, I now have some doubts about it, and will be glod to have some facts explained. Between Zanesville and Marietta are ten dams on the Muskingum River. These dams have an average height of ten feet; yet in the Walhonding, Cocosing, Tuscarawas, Connotten, Killbuck, Mohican, Nill's Creek, and other streams forming the Muskingom, fishes may be found during every month of the year. There are quite a number of dams across the Scioto, between Columbus and Portsmouth, on the Ohio; yet here at Columbus, and above the State dam, have been taken during every month of the year three or four species of cotfish, red horse, black sucker, mud-sucker, buffalo, wall-eyed pike, (called salmon here), ringed perch, black bass, rock bass, horned chub, shovel fish, gar fish, grass pike, and several species of minnish. If these fish are migratory, when do they migrate? As stated, they have been taken in all months of the year. If they do migrate, and get back again over the ten-foot dams of the Muskingom, what is the use of chutes or passage ways? Our woodpeckers, robins, and other birds are migratory, but when they leave us in the fall we see nothing of them until their return next spring. If the fishes go down stream in the fall, then there ought to be none in our waters during the winter; but it is notorious that all the species found in our waters in the summer are also found here in the winter. I will be under obligations to Mr. Logon, or to Seth Green, if they will inform me—

First—What is the use of chutes or passage ways for fish, if our fishes are not migratory?

Second—In the event that they do migrate, why is it that they are taken in our waters during every month of the year?

Third—Suppose there are ten dams over the Scioto between Dublin and Portsmouth; a chute at each dam, properly made to resist freshets, etc., will cost at least $3,000, each or $30,000 in the aggregate, the legal interest on which, at Ohio rates, eight per cent., will be $2,400 annually. Will not Mr. Green enter into a contract, warranting us to have ten times the amount of black bass and muskalonge, if we pay him this interest annually for ten successive years for young fry of the bass and maskalonge, and place them in each dam, than we would have if we constructed the chutes, but placed no fry in the waters?

I am very desirous of having my acts as Commissioner to be promotive of the best interests of the State, and am free to confess my embarrassment in relation to the chutes, and therefore beg to be properly and correctly advised.

JOHN H. KLIPPART,
Sec. Ohio State Commission of Inland Fisheries.

Natural History.

[This Department is now under the charge of a competent Naturalist, indorsed by the Smithsonian Institution, and will henceforth be made a special feature of this paper. All communications, notes, queries, remarks, and seasonal observations will receive careful attention.]

FORMULATING FIELD NOTES.

We have received from Mr. C. C. Burnett, Cleveland, Ohio, an appreciative letter, in which he says:—

"How would it do for you to improvise a form and publish the same in FOREST AND STREAM—something that naturalists could copy from, and which would give uniformity to the reports?"

Unfortunately we think it would not do at all. It seems to us that an attempt to formulate field notes so that from all parts of the country, and all sorts of circumstances they should read precisely alike, would result in a failure to gather the information which we seek. Such an attempt would trammel and embarrass observers, tending to limit their attention to a few studied or preconceived details, instead of urging upon all the necessity of open eyes always, and minds eager to grasp whatever facts of nature may present themselves. It would not in the least facilitate the writer in watching for the data asked for in the recent call of FOREST AND STREAM, to feel that he was expected to fill out a specified form in making his daily field notes. He fears that it would be a very "wooden" set of observations that should fill his book when the season was over. To some persons of a more methodical turn of mind such a formula, however, might be an aid; but such persons could more easily and satisfactorily devise a form than we could do it for them.

While we cannot recommend the suggestion of Mr. Burnett—for which, none the less, we thank him—we are able in every one of the issues of this journal, at present, to offer models of what a naturalist's field notes should be. The contributions, one and all, which we have been printing, and which appear herewith, are precisely those which are needed in order to further the science in which we are interested; and we are confident we shall not lack a continuance of them, and that important results will follow.

BIRDS OF LOWER MICHIGAN.

BY A. B. COVERT, OF ANN ARBOR, MICH.

(Continued from Page 99.)

FAMILY SYLVICOLIDÆ.

Mniotieta varia. Black-and-white creeper. Common during the spring and fall migrations, arriving about the 1st of May. It is rare during the breeding season, and makes its nest about the 20th of May. It departs by September 1st.

Parula americana. Blue yellow-backed warbler. Rare, arriving at Ann Arbor by the 20th of May. This bird undoubtedly breeds, but I have never taken its nest in this locality, although I have seen and shot it during the breeding season. It leaves for the South by September 1st.

Helminthophaga chrysoptera. Blue golden-winged warbler. Rare, arriving about the middle of May, and departing by August 20th. I have found one nest, the date being June 10th.

Helminthophaga ruficapilla. Nashville warbler. Rare; only a few breed in southern Michigan, arriving by the middle of May. It breeds about the 10th of June, and departs for the South about the first of September.

Dendræca æstiva. Yellow warbler. Very common, arriving by May 1st, breeding about June 1st, and departing south September 1st.

Dendræca virens. Black-throated green warbler. Common in spring and fall, appearing first about May 1st. I have never known it to breed in this locality, and have never taken the bird in the breeding season. It returns in its fall migration about October 1st.

Dendræca cærulescens. Black-throated blue warbler. Common in spring and fall migrations with the preceding.

Dendræca coronata. Yellow-rumped warbler. Common in migrations, but rare in the breeding season. Several nests were found about June 1st. It returns south about the middle of October.

Dendræca Blackburniæ. Blackburnian warbler. Common with the yellow-rumps in migration. One nest was found with young on June 14th, 1873. These warblers go south by October 15th.

Dendræca striata. Black-poll warbler. A common migrant, arriving here from April 15th to May 15th. It does not breed, but passes quickly to the north, returning in the fall migrations about October 1st.

Dendræca castanea. Bay-breasted warbler; rare migrant, arriving here about the last of April, passing through, and returning southward about the middle of October.

Dendræca Pennsylvanica. Chestnut-sided warbler. Common summer sojourner, arriving here by April 15th, breeding from the 22d of May to the 15th of June, and leaving here about September 1st.

Dendræca maculosa. Black-and-yellow warbler. This beautiful bird is very rare at all seasons of the year, arriving here about May 15th, and remaining about two weeks, when it passes to the north. Its return in the fall occurs in September.

Dendræca Kirtlandi. Kirtland's warbler. Very rare. But few specimens of this bird have ever been taken by the naturalists of this country. As near as I can ascertain mine is the seventh specimen ever secured. It was a female, and was obtained May 15th, 1875. I may at some future time give a description of this warbler, and its habits as far as I have observed them.

Dendræca palmarum. Yellow red-poll. Not common in migrations, and does not breed. It reaches here in spring by the 1st of May, and passes southward in the fall during September and October.

Dendræca pinus. Pine-creeping warbler. Common in migrations, arriving here by April 15th. It seldom breeds; but a few have been taken from the 1st to the 10th of June. Returning south, the pine-creeper appears plentifully during the third week of September.

Seiurus aurocapillus. Golden-crowned thrush. Common, arriving by May 1st. Breeds about May 20th, and departs for the south in September.

Seiurus noveboracensis. Water thrush. Common, arriving with the preceding. It breeds about the 1st of June, and departs about September 15th.

Geothlypis trichas. Maryland yellow-throat. Very common. It is first seen about May 10th, and breeds about the 10th of June. During September all move southward.

Myiodioctes mitratus. Hooded flycatcher. Very rare; but one specimen taken in five years, the date being May 7th, 1875.

Myiodioctes pusillus. Green black-capped flycatcher. Also very rare. It comes about the middle of May, and has been taken during the breeding season, but I have never learned of its nest being found. About the 1st of September this bird starts upon its southern migration.

Myiodioctes canadensis. Canadian flycatcher. Not common, arriving in the latter part of May, and breeding about June 10th. In three instances I have found the nest of this bird to contain six eggs.

Setophaga ruticilla. Redstart. Abundant. First appears early in May, and breeds about the 25th of the month. In the fall it lingers until late in September.

[To be continued.]

SHOWER OF FLIES.—A Quebec dispatch of April 3d says:—Judge Taschereau has forwarded a bottle of flies to Dr. Lorne, of the Laval University, with a letter stating that they are samples of a shower of flies that fell with the snow at river du Loup during a northeast tempest on Monday, covering several acres. Millions of these insects were walking over the snow without appearing able to fly. In shape they resemble the mosquito, but are somewhat larger.

NOTES FROM OUR CORRESPONDENTS.—N. B. Covert reports the late capture of an albino robin at Rome, Mich., which is in the collection of the Adrian Sporting Club.... C. A. Allen (Nicasio, Cal.) tells us the curious story of an albino cuckoo which he saw some years ago at the house of James Gatley, the hermit-naturalist of Hyde Park, Mass. The child of a citizen of Hyde Park died. The following day the mother was in the garden, when this snow-white bird alighted on a bush near her. The lady took the bird in her hand without its attempting to escape, and carried it into the house when it suddenly expired. Her husband then took the bird to Mr. Gatley to be mounted, and finally gave it to him. His wife, however, objected strenuously to losing the bird, expressing the firm belief that the spirit of her little one had come to her in the white bird, and nothing would induce her to part with it. The lady was of Scotch parentage....The blue-bird and meadow lark are certainly migratory in Louisiana. The meadow lark is thoroughly absent from here during the summer, and the blue-bird seldom ornaments our forests during other months than January and February. His stay with us is short and sweet. He comes to us as fat as butter, and stays until our dreamy spring like climate inspires him with love, when he leaves for the North to grow poor with domestic cares. Our people warmly welcome him with double-barrelled shot guns. Their favorite method of studying his characteristics is by broiling. If anything is delicious, digestible, and wholesome, that is a fat broiled blue-bird.
(JOHN E. LEET, Manneville, La.)

ZOOLOGICAL.—Dr. Abbott has for several years noticed Bewick's wrens in considerable numbers at Trenton, N. J.... In Wisconsin, bumble-bees have been observed perforating the corollas of the flowers of the golden currant, to get at the honey, piercing seven flowers a minute sometimes.... On Antelope Creek, Nev., Rev. Dr. Hoffman found Swainson's buzzards and Bullock's orioles breeding amicably in the same thicket; and at Big Pines, Owen's Valley, Cal., he found in August a nest of *Stellula calliope* upon a small cottonwood branch....Dr. Gunther has discovered that the young of sword fishes and *Chætodus* possess structures exceedingly different from the adult; young sword fish has no sword....Wm. Couper, of Montreal, has observed the night-hawk nesting on the flat roofs of buildings in that city....A. K. Fisher, last year, found several small birds impaled upon, or entangled in the burrs of the burdock, where they perished, or extricated themselves with many wounds.—*Naturalist for April.*

—We doubt very much whether any one man has been of so much service to the world of science as Mr. Darwin. All the world does not agree with some of his deductions. It is more than likely Mr. Darwin himself does not expect them to do so, but no one has given more facts of importance than he has.—THOS. MEEHAN.

CALENDAR.—Mr. Allen's calendar for Massachusetts for April 1st to 20th, is as follows:—

1st to 20th.—The pine and yellow red poll warblers, ruby-crowned kinglet, the woodcock, killdeer, great blue and night herons, the bitterns, kingfisher, fish hawk, sharp-shinned, Cooper's and sparrow hawks commonly begin to make their appearance. Snow-birds, song, fox-colored and tree sparrows are more aboudant than at any other period of the year. The last of the winter visitors are redpoll. Geese and ducks are passing in flocks to the northward.

10th to 20th.—During this time appear the hermit thrush, white-bellied swallow, and the golden-winged woodpecker. Chippiug, field and savanna sparrows arrive; also the willets, the tell-tales, the least semipalmated, solitary and spotted sand-pipers, Wilson's or the English snipe, golden and field plovers. The fox-colored and tree sparrows, snow-birds, pine finches and shore larks, mostly disappear, passing northward. Robins, song-sparrows, Carolina doves, meadow larks, the crow and the smaller hawks pair.

VIVIPAROUS PERCH.

The fact that there is a perch found on the Pacific coast which brings forth its young alive, has long been known to scientific men, but is not familiar to the general public east of the Rocky Mountains. The following extract from a recent letter written by Dr. H. C. Yarrow, Surgeon and Naturalist of the Explorations West of the 100th Meridian, to Mr. Fred Mather, will therefore be of interest. Dr. Yarrow writes:—

"I am tempted to send you a few notes from my journal, kept last summer while sojourning in the vicinity of Santa Barbara, California. At that place they abound, and thousands may readily be taken by hook and line. I may premise by stating that no less than seventeen species of these perch are known, all having been noted by Girard, in Vol. X of the Pacific Railroad Reports, and since his time some others have been described, but we do not know but that some of the species have been confounded with those previously described. Any one anxious to trace out the literature of the subject will find a paper by Dr. Gibbons, of San Francisco, in the Proc. Acad. Nat. Sci., Philadelphia, 1854, pages 115 to 122, which gives an account of thirteen species, some of which are doubtless those of Girard's. This paper and Girard's will furnish a very good history of the family, which I should mention, called *Embiotocoidæ*, or *Holconoti*, Agassiz.

I find from my notes that I began fishing for these curious fish from the wharf at Santa Barbara, about the latter part of June, using two small hooks baited with lobster, the hooks being allowed to sink only four feet beneath the surface of the water. Such was the voracity of the fishes that hardly a moment elopsed before one or two were hooked, and in some cases, I may say frequently, in simply withdrawing the line from the water specimens were caught by the abdomen. The most curious parts of this fishing, consisted in the fact that nearly every specimen taken was a gravid female containing from eight to fifteen young fishes, which were readily obtruded from the abdomen by gentle pressure. In some cases the whole family appeared, surrounded by their enveloping membrane; in others, they came forth singly. The little fellows from one half to one inch in length were very agile, and when thrown into the water, swam away in the most lively manner. The mothers also notwithstanding the somewhat rude obstetrical operation they had been submitted to, following their offspring, swimming away rapidly and energetically. I took many hundreds of specimens, some of which I carefully dissected and found my observation to agree in the main with those of Girard. It is hardly necessary to give those results here, as I now have in course of preparation a paper upon the subject. The commonest species at Santa Barbara was *Embiotoca cassiti*, Girard. I believe, from the size and activity of the fœtal fish, that had I not hastened their birth as I did, Nature would have performed the operation for the majority, somewhere about the first or second week in July."

A COMPARISON OF WINTER BIRDS.

RIVERDALE-ON-HUDSON, N. Y., March 16th, 1876.

EDITOR FOREST AND STREAM:—

I send you a brief comparison of the winter birds of this locality, during the past two years. The past two winters combined the extremes of the winter weather of our climate, and presented unusual opportunities for observing the different habits of certain birds, during an extraordinarily rigorous and an unusually mild winter. The severity of the winter of 1874-5, brought many birds down from the North, which do not ordinarily visit us, and in greater numbers than I had ever seen them before, indeed most of the winter residents appeared more numerous than usual. Among our boreal visitors I may mention the red and the white winged crossbills (*Loxia curvirostra* var. *Americana*, and *L. leucoptera*), the pine grosbeak (*Pinicola enucleator*), the pine linnet (*Chrysomitris pinus*), the red-poll linnet (*Ægiothus linaria*), and the snow bunting (*Plectrophanes nivalis*). The first of these birds to arrive in the fall, were the pine linnets and red cross-bills. The cross-bills were the first that I had ever seen here. I first observed them on November 3rd—a small flock feeding on the seeds of the cones of a Norway spruce. They remained with us through March and April, and were last seen on May 10th. I was much surprised to find a pair breeding here in April, an account of which I will give hereafter. Most of the other birds did not arrive till January, 1875. Many of the semi-migratory birds which do not regularly remain through the winter were comparatively abundant that year, notwithstanding the severity of the weather. Robins and blue birds were seen several times, while flocks of purple finches (*Carpodacus purpureus*), were noticed on different occasion. A number of white-throated sparrows remained throughout the entire winter, and one swamp sparrow (*Melospiza palustris*) was seen several times. On February 28th, 1875, I was much surprised while walking through a pine wood, to observe before me a hermit thrush (*Turdus Pallasi*), a bird which I had never before seen earlier than the second week in April or later than the third week in November. It appeared to be in good condition, uttering its well-known "chuck" as it flew from tree to tree, and raising its tail as it alighted, in the manner peculiar to this species. I again saw a hermit thrush near the same place on March 28th, which was undoubtedly the same one, as no others were seen until April 17th. Whether this thrush had remained all winter, I am unable to say, but think it very improbable that it should have come from the South at that early date, when the winter was by no means over.

During the past winter there have been fewer birds in this locality than I have ever known before, and none of our northern friends have made their appearance. It might be supposed that on account of the unusual clemency of the season, the birds which do occasionally remain with us would be more numerous than usual, but this is not the case. I have seen but one robin during the entire season, a few blue birds, and not more purple finch, or cedar-bird, while goldfinches (*Chrysomitris tristes*), which are ordinarily common, have been seen very seldom. One of the most common birds this season, however, was the bald eagle (*Haliæetus leucocephalus*), during the latter part of February and the first of March. I have seen on one morning as many as twelve eagles sitting on the cakes of ice in the Hudson River, and very often have observed as many as six or seven. I am anxious to learn whether ornithologists in general have noticed a scarcity of birds this winter, in other parts of the country.

E. P. BIORNELL.

QUAILS EAT SKUNK-CABBAGE SEED.

TENAFLY, N. J., March 30th, 1876.

EDITOR FOREST AND STREAM:—

I send herewith a box of berries of the skunk-cabbage (*Symplocarpus fœtidus*), which form the principal food of the quail in this region. I do not think it is generally known that quails will eat these berries in preference to buckwheat, but such is the case. Last fall I found three bevies of birds on a buckwheat field, near a swamp filled with the cabbage. In September they were feeding on the buckwheat, but in November they had all moved into the swamp, and I never found, or heard of their being found, outside up to the close season. I have opened a number of the birds, and found from five to seven of the berries in each of their crops. Some of the berries are nearly as large as chestnuts. The berries grow in clusters of twenty to thirty-six. Two or three plants will furnish enough feed for a very large bevy of birds, and as the plants grow closely together the birds soon find enough to satisfy them. When food is plenty quail do not travel far, but prefer to seek some sunny place where they can dust themselves. Sometimes they will not move more than a few yards from their roosting place, which makes them very hard to find, as the dogs have no trail to work on. The berries have the same rank smell as the plant, and sometimes flavor the bird's flesh so strongly as to be unpleasant to the taste. The weather has been so mild this winter that the quails that were left over are doing very well, and are plenty enough to make good sport next fall. We have a few pairs of Ohio birds, which we shall turn loose about the 1st of April, if the weather is mild. We have fine cover and no pot-hunters. RED WING.

THE BIRDS AND COMING STORMS.

CAMBRIDGE, Mass., March 25th, 1876.

EDITOR FOREST AND STREAM:—

I notice that your correspondent, A. B. Covert, refers to the freezing to death, at Ann Arbor, Michigan, of blue-birds and song-sparrows after a heavy fall of snow late in April, and asks "if birds are able to foresee the coming weather, why had they not departed and escaped death?" This is certainly a pertinent question. The fact is one that most of us have observed at other localities at some time or other, but only, I think, upon the occurrence of wholly unprecedented, or at least very unusual, conditions of the weather, and under just such circumstances as Mr. Covert describes, namely, unseasonably and unexpectedly heavy cold storms of snow. The weather had undoubtedly been previously warm and comfortable for the species in question, who had doubtless come from the South some days, and probably weeks before, and had become in a measure settled for the season. The reports of the National Weather Bureau, on the other hand, certainly show that during the fall and winter the ducks, geese, cranes, crows, and other species of birds often, and apparently generally, abandon their former haunts upon the approach of a cold wave or severe winter storm for more southern localities, often passing beyond the reach of the severity of these changes, taking their departure often but a few hours before these unfavorable changes occur. J. A. ALLEN.

SMITHSONIAN INSTITUTION,
WASHINGTON, D. C., April 1st, 1876.

EDITOR FOREST AND STREAM:—

Many of your readers are probably familiar with the Labrador duck, or *Camptolæmus labradorius*, an American species, which is now extremely rare, straggling individuals only, mostly young, being now taken at long intervals on our coast. Formerly they were quite abundant, and specimens are to be found in many of our older museums. The species is now apparently so rare as to suggest the possibility of its entire disappearance before a great while.

I have lately received a letter from Mr. Gordon Rowley, of England, who informs me that he is about publishing a memoir on this duck, and desires to include in it a list of all the specimens that are at present existing in the museums of the United States, and I beg to apply, through your columns, in his behalf, for the information referred to.

SPENCER F. BAIRD.

BURNS.—Charcoal has been discovered to be a cure for burns. By laying a piece of cold charcoal upon the burn the pain subsides immediately. By leaving the charcoal on one hour the wound is healed, as has been demonstrated on several occasions.

Sea and River Fishing.

FISH IN SEASON IN APRIL.

Brook Trout, *Salmo Fontinalis*. Land-locked Salmon, *Salmo Gloveri*.

☞For list of seasonable trout flies for April see our issue of March 23d.

FISH IN MARKET.—The continued unsettled weather has made fishing a matter of some difficulty, but thanks to the refrigerators there is but little change in either variety or quantity. North River shad made their first appearance on Tuesday, about fifty fine fish being taken. When fine weather sets in large catches will be made. California salmon are very plentiful. Two more car loads are due today, and consumers may expect low prices. Our quotations are as follows. Striped bass, 16 to 20 cents per pound; smelts, 15 to 20 cents; Salmon, frozen, 50 cents; California do., 45 cents; mackerel, 25 cents each; North Carolina shad, 50 cents each; North river do., $1.50 each; white perch, 18 cents; Spanish mackerel, 50 cents; green turtle, 25 cents; terrapin, $12 per dozen; frost fish, 8 cents per pound; halibut, 15 cents; haddock, 8 cents; king fish, 15 cents; codfish, 8 cents; black fish, 15 cents; herrings, 6 cents; flounders, 8 cents; eels, 15 to 20 cents; lobsters, 10 cents; sheepshead, 30 cents; turbot, 25 cents; scollops, $1 per gallon; soft clams, 30 cents per 100; white fish, 18 cents per pound; pickerel, 15 cents; sun fish, 10 cents; yellow perch, 10 cents; brook trout, Canada, 50 cents; Long Island do., $1; hard crabs, $4 per hundred; pompano, 1$ per pound.

—One of our New York City subscribers, who has just returned from a vacation in Florida, mentions having had great sport recently in catching black bass among the lily-pads off the point of Harts's Island, opposite Palatka. The fish averaged 4 pounds each in weight, and took the baited hook very freely. Sixty or seventy pounds at a sitting was a common basket. These fish, by the way, can be caught off any of the sand bars along the river, and there are two or three capital places between Palatka and Dunn's Creek seven or eight miles up. The fishing in Dunn's Creek either with fly or troll is fine.

—A correspondent writes that he has tried our recipe for dyeing his linen lines green, viz., soaking them in an infusion of green tea, with most gratifying results, and can recommend it.

—It was carelessness and not ignorance that made us say last week that trout fishing was prohibited in Ontario, Canada, until May 1st.

THE ORVIS REEL.—Last summer Mr. Chas. F. Orvis presented us with one of his new trout reels, requesting us to give it a trial and report upon its merits. Our readers can obtain a very excellent idea of its appearance, construction, and qualities by referring to the engraving and printed description in our advertising columns. It is made so that it can be used either with or without a "click." The click is a slight check upon the free rendering of the line when a fish is running out with it, and in our opinion is indispensible to prevent the line overrunning, which it would be apt to do otherwise, unless checked by the thumb pressing it against the rod; and the wear and tear of the thumb is something to be considered, especially when big fish are in hand! We think we can conscientiously say that the Orvis reel fulfills all the conditions claimed for it. To keep the line dry is a point gained, for very few anglers will take pains to dry their lines immediately after use; and unless this is done they soon rot. Being narrow, the reel takes up line rapidly, thus accomplishing in a great degree the work of a multiplying reel, and in the third place it holds more line than most reels. Twenty-five yards is not line enough for a land-locked salmon, and who would use heavier tackle than trout tackle for these noble fish, which average only two and a half pounds? Besides, brook trout in large rapid rivers will sometimes demand the ordinary twenty-five yards in full, and give no receipt for the same. The reel is nearly as light as the average reel, and weight at the but of a rod is often an object. With an Orvis reel, and an Orvis rod, and plenty of prog at the Orvis Equinox House in Manchester, Vt., the sportsman wants little more to fill up the measure of his desires.

—Public notice is hereby directed to the following close seasons for fish, adopted by the Governor General of Canada, in Council, on the 31 of April and the 30th of Sept., 1875:— Province of Ontario—whitefish, salmon, and lake fish, from the 12th of November to 1st of December; speckled trout, brook, or river trout, from the 15th of Sept. to 1st of January; bass, from 15th May to 15th June; pickerel (*dore*), from 15th April to 15th May; maskinonge, from 15th April to 15th May. Province of Quebec—whitefish, from 10th November to 1st December; salmon trout, lake trout (or lunge and Winnoniche), from 15th October to 1st December; speckled trout, brook, or river trout, from 15th September to 1st January; bass, from 15th May to 15th June; pickerel (*dore*), from 15th April to 15th May; maskinonge, from 15th April to 15th May.

NEW YORK—*Syracuse, April* 3d.—Trout from Wisconsin are selling here at 14 cents per pound, and pickerel from Oneida lake at 18 cents. John Mann, manufacturer of spoon hooks, has prepared an elegant case of them for the centennial, containing fifteen or twenty varieties.

CONNECTICUT—*Higganum, April* 3d.—We are commencing to catch alewives in the Connecticut River at this place, catching the first on Thursday, March 30th, and on Saturday quite a number. They usually precede shad by about ten days here. They (alewives) sell for 25c. per dozen until they grow plenty, then at 8c. and 10c. per dozen. Great numbers are caught here every season; also shad. We caught a black bass in our alewive net on Friday last; weight, 1¼lbs. I never heard of one being caught here before, excepting once, last fall, when I caught one with a spoon; it weighed 3 lbs. I like your paper very much; you are the fisherman's best friend. Success to you.

CHAS. O. G.

[Higganum is on the Connecticut River, 22 miles above Saybrook, where the tide rises and falls, the water at the flood of course being salt. The facts given by our correspondent relative to black bass are very interesting, (if *Micropterus nigricans* is the fish in question,) and worthy the attention of the Connecticut Fish Commissioners. Should any reader learn of black bass being taken in the lower waters of the river hereafter, they will render a public service by reporting the fact. If "C.'s" premises are correct, we shall have Connecticut River shad in market presently.—ED.]

VIRGINIA—*Leesburg, March* 23d.—Some few bass have been taken legitimately and legally with the minnow, and some by illegal traps. I shall commence observations early in April to determine their times for spawning, breeding, etc., for this latitude so as to give information to fix the proper limits of the close season. There are sportsmen enough here to form a protective association, but it has not been so shaped. Give us in your paper some more Ichthyological lecturing; your split bamboo articles are just the lore needed now. My wife reads your paper as regularly as I do. T. W.

FLORIDA—*Musquito Inlet, March* 20th.—We have had cold and stormy weather for the last four weeks, and fishing has been poor, except for sheepshead, which always feed. The bass, groupers, snappers, whiting, and other good fish have hidden themselves to wait for warm weather. So say the local fishermen. Sharks and rays of gigantic size still prowl around the waters, playing havoc with hooks and lines, and promoting the interest of the tackle dealers. Black bass fishing in the rivers and lakes has been good. Twelve-pound fish are recorded. Lowd's Hotel at New Smyrna has been full of anglers all winter.

S. C. C.

MOVEMENTS OF THE FISHING FLEET.—It has been a lively week for the fishing fleet, and the work of landing and taking care of the fares has rendered it busy about the wharves. There have been 74 arrivals the past week, 55 from Georges, 10 from the Banks, and 9 from Newfoundland. The receipts of fish are as follows: 750,000 pounds of halibut, from the Banks, 275,000 pounds from Georges, 1,375,000 pounds of cod-fish, and 900 barrels herring. The fares of codfish from Georges have been light for the season, which together with the demand for fish for Nova Scotia, will have a tendency to keep the prices at present quotations. Halibut, have been plenty, several large trips having arrived. A good portion of the stock now afloat in the harbor will be sold for curing. The prices during the week for shipment, fresh, has been 4 and 2½ cents per pound, white and gray. Round Georges cod-fish have been selling at $1.75 per hundred pounds. Shore cod-fish $1.50; haddock $1.00.—*Cape Ann Advertiser, March* 31st.

DO WHITE-FISH (*Coregonus albus*) TAKE THE FLY?

FLATHEAD AGENCY, M. T., March 9th, 1876.

EDITOR FOREST AND STREAM:—

In writing of the white-fish, *Coregonus albus*, "Frank Forester" states (page 397): "So far as I can learn, the white-fish is nowhere taken with the fly, unless by pure accident; and that it is utterly unworthy of the angler's pursuit, as a fish of game, cannot be doubted."

Genio C. Scott (page 290 and 291) seems to infer that they are not taken by the fly, or bait. Has subsequent experience shown to the contary? Is it known whether they are caught in rivers, or streams, other than those falling into the Arctic Sea? I ask these questions for the reason that I believe the white-fish is caught in streams of this Territory, both in the Atlantic and Pacific slopes. If not the white-fish, what is it? It is, as Scott describes the white-fish, a "rocker-mouthed succulent delicacy, * *. The color of the back gray, and the rest of the fish a clear white of most lustrous sheen." The weight, however, rarely exceeds one pound, but he takes the fly like a good fellow. I once caught one in the Yellowstone that I believe would have exceeded four pounds.

The cut accompanying Genio C. Scott's description (page 290, "Fishing in American Waters,") is like the fish I have reference to, except that it does not show the mouth quite so sucker-like, and it lacks that hump between the shoulders and on the neck, (if I may so express myself,) like that so much admired in a well fed hog, and the fish we catch, looked at from the front, presents its head, in outline, not unlike that of a blunt nosed porkor, with flat cheeks. CILIBILI.

Our correspondent's description seems to apply to the *Coregonus albus*. These fish have been known to take the fly on Lake Champlain at a time when a large lead-colored fly makes its appearance in countless numbers, strewing the surface of the water in acre-patches of dead bodies. The white-fish are then feeding on the surface. This fly is locally known as the "shad fly;" and the white-fish are often called shad. We have seen the same fly on the St. Lawrence on every visit at the season referred to, which is about the 1st of August. It is there called the "eel fly." We do not think that the white fish of the lakes is an habitual fly-taker by any means, any more than the salt water shad is; but it is not remarkable that the angler should hook them repeatedly when schools of many thousands are feeding on the natural flies. No doubt the motion of the artificial fly drawing through the dead masses would attract attention. White-fish, which resemble in their structure the *Coregonus albus* in all respects are caught in Lake Waushining, Conn., and in interior lakes other than the Great Lakes; we do not remember having seen them in any streams. If our correspondent can give any further information on this point, it will be of value. Has he ever caught the fish he speaks of with a fly, either on the Atlantic or Pacific slope?

PICKEREL IN ADIRONDACK WATERS.

NEW YORK, March 27th, 1876.

EDITOR FOREST AND STREAM:—

Your correspondent "C. C." is right in regard to there being pickerel in waters other than the Raquette. Lake Saudford was stocked some twenty-five or thirty years ago, by John Cheney and the late Tony Say-

dor, who brought twenty-four of the fish in a cask from Schroon Lake, and put them into Lake Sandford, where they increased to a wonderful extent, until the breaking away of the dam at the lower works some years afterwards, when they were carried down the river to Lake Harris, and from there all the way to Glen's Falls, for might I know. It was from these waters that the fish got into Long Lake and the Raquette River. They were taken from Rich Lake (not Rice), or some of the small ponds adjacent, by some Long Lake guides, who put them into a small stream running into Long Lake, from whence they have gone all through the waters of that region. Lake Sandford still contains pickerel of large size. A few years ago a party of five, of which I was a member, went to Lake Sandford, intending to enjoy a week of camp life; but having taken seventy pounds of pickerel on the day of our arrival, and killed a buck the next morning, we were obliged to return home in the afternoon of our second day (it was the first week in September) in order to save our fish and venison. Among the fish was one that turned the scale at eighteen pounds. If any of your readers contemplate a visit to the Upper Works this summer, I would advise them to take the strongest kind of spoon victuals they can find, for I am sure there are fish in that lake that will weigh twenty-five pounds. TAHAWUS.

The Rifle.

THE INTERNATIONAL MATCH.

THE latest advices from the other side indicate that there is now no hope of the United Kingdom being represented by a team of riflemen at Creedmoor this year, with Sir Henry Halford at its head. A correspondence has been passing between that gentlemen and the Scottish and Irish clubs, and the latter appear to have been willing to forego their separate representation providing the Scotch would do the same. But this they have declined to do, and from a dispatch at hand on Thursday last, we learn, that "at a meeting of the Irish Rifle Team Association, held on the 29th ulto., rules were adopted regulating the preliminary contests for the selection of a team to go to Philadelphia. A letter from Sir Henry Halford was read, urging that an united team be sent to America, but this proposal was rejected, as the Irish riflemen have already forwarded their acceptance of the American challenge."

There can be no doubt that when this question was discussed at Wimbledon last summer, it was understood that a team representing the United Kingdom, was to come over. Since then, a feeling of jealousy appears to have arisen on the part of the other clubs towards the National Rifle Association, or perhaps a fear on their part, that in the preliminary matches for places in the team, they would not be treated with fairness. With the merits of this difficulty or misunderstanding we have nothing to do; but if such existed, the invitations sent from here afforded a capital pretext for the organization of separate teams. Putting aside the question of the pleasure it will afford us to receive the Irish, Scotch and Englishmen, and "the more the merrier," it can not be doubted that the interest in the match would be greatly enhanced, were the contest to be between teams representing the United Kingdom and the United States. If three teams come out and one of them wins, the other two will be virtually beaten teams. We think that in the following letter addressed by Sir Henry Halford to our contemporary, the *Volunteer Service Gazette*, he has stated the case very plainly:—

SIR—Colonel McDonald is mistaken in thinking that the match, for which a challenge was sent by telegraph through Colonel Gildersleeve at Wimbledon last year to the National Rifle Association, for a British team to shoot in the United States this year, is any other than that for the championship of the world, which is now in question. The challenge was talked over at Wimbledon among the best shots of England, Scotland, and Ireland; a strong opinion expressed that it should be accepted by a united team from Great Britain and Ireland, and Colonel Gildersleeve was told at the time that the challenge would be accepted by an united team from Great Britain and Ireland.

In talking the matter over with me, he said that he hoped that ranges would be available at Philadelphia for the match, which proves that the challenge was not one which referred only to a match with the New York Club; and in a letter to me received lately, expresses his very great regret that the separate challenges which were sent as a matter of courtesy to Scotland and Ireland, should have been taken up by the Scottish National Club, for that he never expected that more than one team would come out.

When Colonel McDonald finds fault with the National Rifle Association for not consulting Scotland and Ireland, surely he forgets that the National Rifle Association is composed of English, Scotch, and Irish; that it numbers among its members all the best shots of the United Kingdom; and that it has a strong Scotch element on its Council. How can the Scottish National Club claim to represent Scotland, when it cannot find among its members a man of sufficient position to act as captain of its team? Have any of its influential men refused to act in that capacity?

So far from discounting a victory, it is the opinion of men more conversant with the highest class of match shooting than Colonel McDonald, that it will require all the energies of the best riflemen that Great Britain and Ireland combined can produce to hold their own against our American cousins, who have already twice wrested a victory from the picked shots of Ireland.

I am, yours faithfully, H. ST. J. HALFORD.

Weston, March 4th, 1876.

Since the above was written, a dispatch from London under date of April 1st, announces, that Major Drake, of the National Rifle Association, informs the London agent of the New York Associated Press, that in consequence of the separate action of the Scotch and Irish associations, the organization of a British team, to participate in the Centennial matches, has finally been abandoned.

—CREEDMOOR JR.—A match was shot at this gallery on Saturday last, between the team made up of employees of the Citizens' Insurance Company, and another, comprising clerks of Messrs. Howard, Sanger & Co. The Insurance team won by the following score:—

CITIZENS' INSURANCE CO., Name.	Total.	HOWARD, SANGER, & CO. Name.	Total.
F. M. Parker	42	E. M. Eames	42
J. W. Edwards	40	S. White	40
G. W. Jones	38	Ed. Lynes	39
C. F. Grim	36	A. C. Howard	35
R. Chapman	37	W. H. Clapp	29
Total	197	Total	181

—The Columbia Rifle Association of New York held their semi-monthly practice shooting last week, at their grounds, Steinbrenner's Park, Guttenberg, N. J. Distance, 200 yards, off hand, any rifle, at the ring target, which is divided in 25 rings of ½ inch diameter each. The following gentlemen made the best scores:—Jac. Heintz, 191 rings; A. Ernisch, 194 rings; G. Baier, 168 rings; G. A. Kundahl, 161 rings; Kato, 145 rings.

The above organization held a special meeting yesterday, for the purpose of selecting a team to compete at the Centennial match, at Philadelphia, July 6th, 1876.

The following shooting festival will be held the next few weeks, to which all riflemen are cordially invited.

Opening festival of Schuetzen Park, at Bergen Avenue, Jersey City (Greenville,) the 8th of May.

Opening festival of Schuetzen Park, at Union Hill, N. J., the 29th, 30th and 31st of May. The first 2 days shooting for all comers; the last day, distribution of prizes and team shooting.

On the 5th, 6th and 7th of June, grand shooting festival of the Jersey City Schuetzen Corps, at the Schuetzen Park, at Bergen Avenue, Jersey City (Greenville.)

The programmes of all the above shootings will be published in a few days.

THE USE OF THE STRAP OR SLING.

HAMILTON, Canada, March 27th, 1876.

EDITOR FOREST AND STREAM:—

I see by your last issue that the National Rifle Association of New York, have amended their rules in prohibiting the use of the sling on the long range rifle. This will be very apt to disappoint several of the members of the teams coming over from Britain to the Centennial matches, who may have practised with the sling, as it is distinctly allowed by the National Rifle Association of England. As I had some doubt of it being allowed at Wimbledon, I wrote Capt. Mildmay, Secretary, and his answer is as follows: "I have submitted your letter to the Council and am now in a position to answer your questions. The Council desire me to state that no objection is made at Wimbledon to the use of a sling, provided it be attached in the usual way, if so attached you may use it as shown in the photograph. (The photograph is similar to the one I sent you some time ago)." I think the council of the National Rifle Association of New York, have instituted a very bad precedent, which may tell against themselves at some future time. For instance, if other associations were to amend their rules to regard to any position, and construe it to mean any position in which the barrel of the rifle does not rest beyond where held by the left hand, or in other words, prohibit resting it on the leg, which I firmly believe was the real definition of any position when first instituted. Now such an amendment as this would be more reasonable and fair than prohibiting a sling, and would tell more against the majority of United States marksmen. So all associations should be careful in not instituting rules which may conflict with foreign associations with whom they may meet in friendly competition. I also see by the FOREST AND STREAM that the Dominion of Canada have accepted an invitation to send a team to compete at the Centennial contests. I think there must be some mistake about this, as the only gentleman authorized to accept a challenge for the Dominion, is Lieut Col. Gzowski, President of the Dominion Rifle Association, and I understand that an invitation has not been sent to him. SHOOTIST.

HOW TO AIM THE COMMON HUNTING RIFLE.

March 8th, 1876.

EDITOR FOREST AND STREAM:—

In a very interesting article which appeared in your generous columns of November 4th, 1875, under the heading, "How to Choose a Rifle," I find many points presented, in which I most heartily concur, whilst in others I do not. I will notice one of these now, in reference to sighting the rifle, and leave others to be noticed, perhaps hereafter. In so doing, my object is much less to criticise, than to attract the attention of rifle shooters, especially beginners, to those many little mysteries in the art of practice, which must be known and regarded before the best results can be reached with the rifle. For rifle shooting is a science which cannot be fully comprehended, without considerable study, thought, and reflection. In this light, and with these ends in view, I present the following to your host of readers, and hope it may prove useful, if not interesting, to many. In order that the reader may get the drift of the article referred to, as well as the views of the writer, I will quote largely.

He says: "The next requisite is, that the trajectory of the ball should be so flat within the above ranges, or, in other words, its velocity so great that the rifleman should not be obliged to depend on an elevating back sight, raised to distances before ascertained," (or sot off) "but should be able by merely drawing a coarser bead the farther off he is to hit the mark. There is no military or long range rifle that will do this. The best example of a weapon that could do this was the old muzzle-loading long barreled Kentucky rifle, &c."

* * * * "With a short range rifle (not over 200 yards) proportioned as we have described, the drop of the ball owing to its great velocity, is so little, there is absolutely no difficulty in judging of the distance required. Whether you are at 25, 50, 75, or 100 yards, all you have to do is to draw a little coarser bead the farther off your game is. Practice will soon show you how much. Your hait should not deviate more than a couple of inches above or below, and this does not exceed the limit of accuracy heretofore held down."

REMARKS.—I substantially concur with the writer in what he puts forth in paragraph 2 and 3, except as to his instruction or mode of sighting the rifle. On this point, and a very material one too, to success in shooting, we widely differ. It will be particularly noticed that the rule laid down by the writer for sighting the rifle is, to begin with a fine sight on objects near the piece, and to use coarser and coarser sights continuously as the object is farther and farther off; and this up to 100, 150, or 200 yards, the limits of his rifle in range. I assume this rifle to be like others, that is, to have a point-blank range, and that a fine sight is the standard sight of the range, whatever it may be, thus 100 yards point-blank, fine sight. And so for any other range use a fine sight on the target to get the best shooting.

I. My proposition is: that the writer's rule of aiming does not hold good within the limits of any established point-blank range, to give the best shooting, and hence should not be adopted.

II. But that beyond the point-blank range, or for objects without his limits, his rule will hold good and may be safely followed.

To illustrate this rather perplexing subject clearly, let us take three shots with our "hunting rifle," and partially point out the course pursued by the ball, and the standing errors of the rifle, and incidents to gravity.

I. 100 yards. Let the point blank range be 100 yards. Let the rifle be aimed with a fine sight, assumed as the proper one, at the centre of a "4-inch bulls eye" and fired, and the centre struck. In this shot with a fine sight, the exact conditions of the best sighted rifle, the best aimed, and the best shooting, are attained. I presume the writer will concur in this. But observe, a fine sight is here used, and not a coarser or "coarser" one, as the writer's would necessarily be, for he would use a finer sight at 20, 25, 30, &c., yards than he would at 100 yards. He would necessarily shoot over. Why? because he uses a coarser sight at 100 yards than he would at 20, 25, 30, &c., yards. Whereas he should use the same sight at 100 yards as at 20 yards; both are assumed point-blank distances to this range of our rifle, and both alike demand the exact same sight in order to centre at these two distances. Hence his rule fails here.

II. 20 yards. Again, let the target be removed to about 20 yards from the stand, and its centre fired at with the same fine sight, (standard) supposed possible, as at 100 yards. The ball will centre at this distance, the same as at 100 yards? Why? because here, (or near here) is to be found the nearest point-blank in this range, and where this exist, as it always must in long ranges, the rule must centre. Why? because at 20 and 100 yards, the ball in its flight, cuts the line of sight, and this is the general definition for point-blank, or centre shots, at these two points.

It will be seen that these facts, if facts they are, must be known and regarded, if we wish to attain correct shooting. They give rise to the following fundamental rules:—

FIRST. That the rifle which makes a centre shot (or "holds up") at the end of the range, will also make another centre shot (or "hold up") near the piece.

SECOND. That the same uniform sight, whether it be fine or otherwise, must be used at both distances.

Hence in reply, the same sight should be taken with our rifle on objects at 100 yards as at 20 yards, or near by. And in general, the same sight is always required at the two point-blank distances. This results from the problem.

III. How should the sighting be from the muzzle of the piece up to the 20 yard point, or in general, up to the near point-blank? Let us see. If a like shot, with the same fine aim, as hitherto (supposed) used, be made at the centre of the balls-eye, placed, say one yard from the piece, the ball will strike about ¾ of an inch too low. In other words, the rifle shoots under at this distance. Hence.

THIRD. A very coarse sight, and not a fine one, is required on objects very near the piece, to give the best shooting. This reverses the rule of the writer. This coarse sight requires to become less so, till finally at 20 yards with our rifle it passes off into fine, or the standard sight of the range. The reason for the rifle shooting too low, very near the piece, is plain. The ball starts on its course from below the line of sight, which is always the line of centre-shooting under the definition of point-blank, and does not get up to it, till it reaches the near point-blank, and in this instance, at 20 yards. Here it makes its first centre in passing above the lines of sight, and the next centre it will make will be at 100 yards, where the ball in its falling course will pass below the line of sight. Where the ball is below the line of sight, the rifle shoots too low, as we have just seen, and where it is above the line of sight it shoots too high. We will next examine how the sighting must be when the ball is above the line of sight. It is always above, when it is between the two point-blanks.

III. 55 yards. Again let the target be removed to about 66 yards from the stand. This distance is selected because at about two-thirds of the range generally, the greatest error, and incident to the curve of the trajectory is to be found. Let the rifle be fired at the centre as before, and with the same uniform fine sight (supposed possible) as at 100, 20, and 1 yards. The ball will strike about "two inches" above the centre and miss the target. This is a standing error in the rifle at this point. To correct this error of too high, it is obvious that a finer sight should here be taken, than at 20, 25, &c., yards according to the rule of the writer. It is also obvious that this mode of sighting would add error to standing error, and hence should be rigidly avoided. This greatest elevation of the rifle exists at the highest point of the curve, and gradually diminishes each way, as the curve becomes lower, until it finally disappears at the two point-blanks, here represented by 20 and 100 yards. This must be just so. If we admit 100 yards to be point blank shooting, then, under the rule or definition governing us in the premises, we are stopped from saying it is not so. But the rules to note well here are:—

FIRST.—That to avoid shooting over, a finer sight is always required at and about two-thirds of the range, than at any other point of the range. (say within 50 to 80 yards).

SECOND. That the same uniform sight throughout the whole range will give no greater error than the greatest standing error of the rifle.

THIRD. Hence knowing this, the same uniform sight throughout may always be used, unless one requires a different sight in order to accomplish his purpose.

FOURTH. In handling, use the same fine or standard sight, within about the first 20 and the last 25 yards of this range. And why? because the standing error of the rifle is so small within these limits, that it may be disregarded entirely. At the greatest, it is only about one inch, and from thence to nothing at the two point-blanks. So much for sighting within the range.

FIFTH. But, for different distances beyond the range, as 125, 150, &c., yards, use a sight "coarser" and coarser, "the further off your game is."

It will here be seen (rule 5th,) that the writer's rule of sighting, holds good, that is, beyond the range. The reason for this is plain: beyond the range the rifle shoots too low, continuously so, and hence a constantly coarser sight is required to bring the ball up to the centre of the object. And for a like reason it would hold good, (except near the piece) if the rifle by construction of its sights had no long or military point-blank range, but this kind of rifle is not in use—it shoots too low, and has no certain standard sight. Hence I drop it.

Having now gone over the whole range, and beyond it, and endeavored to explain everything as I passed along, I will now collect my points, in order to show at a single glance, how the sighting should be in order to attain the very best results. The sighting seems to stand thus:—

Coarse very near the piece, with a less coarse to fine at 20 yards, (centre, p. b.,) thence finer to extra fine at 66 yards, (thereabouts and greatest error), thence less fine to fine at 100 yards (centre p. b), thence coarser and coarser, (beyond the range). From which we see that the writer's mode of sighting with a constantly coarser sight does not hold good within the limits of the range, but does beyond it.

Of course different rifles, and the same rifle with different charges, &c., produce different curves, or errors. Hence in general, learn well by practice and study the deviations of your rifle along the whole distance, and then (for close shooting) seek to so aim, as to correct them.

I hope I have not mistaken the meaning of the writer. I think he will agree that my points have been made good. Should I have misinterpreted, there is no harm done; the text has been equally good. It has served to draw out this, written mainly in behalf of young sportsmen with the rifle. I hope it may be acceptable, and prove useful in many respects. I submit it as sound on point-blank shooting, mid applicable in its principles to all ranges. OLD SCOUT.

The American Naturalist. The number for April has the usual varied table of contents, opening with an excellently illustrated article by J. D. Caton upon "The American Antelope, or Prong Buck." The growth and characteristics of its horns are largely dwelt upon. Mr. J. A. Allen describes "The Little Missouri Bad Lands. "The Flora of Guadalupe Island," an article by Sereno Watson, indicates the character of the plant life of that island, which lies off the coast of Lower California. This island has 21 species out of 131 recorded which are peculiar to itself; the remaining flora being Californian in its character, and distinct from that of Mexico. This is also true of its fauna. Besides these, there are several minor articles, the usual interesting paragraphs in the departments (the gist of the zoological portion of which we give in another column), and a sketch of the African Explorations of Lieut. Cameron.

We have received from Kirburn Bros., of Littleton, N. H., a catalogue of their stereoscopic views of American and foreign scenery, together with some specimen cards of a most interesting character, which include views of the City of Mexico and Monot Washington in winter. A more comprehensive illustration of "picturesque America" we have never seen than their repertoire contains. Only the most interesting features and attractive places are shown, but these already number several thousands. In no way can the sportsman and tourist obtain so accurate an idea of any given locality as by examining these copies of nature, and we can conceive that it must be to the advantage of any one to purchase what views he can of any given locality that he intends to visit. Among the rest are seventy views of Bermuda, two hundred of Mexico, fifty of California, fifty of Martha's Vineyard and Nantucket, several hundred of the White Mountains, a great many of the Old World. They are sold at $2 per dozen.

—A Nevada sheep man who had tried and succeeded with sheep, said: "Sheep are better than a government bond, you can tear off a coupon every six months half as big as the bond, and the bond is left as big as it was."

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

—There is a letter at this office to the address of Mr. Benj. L. De rost.

Fan Heel, Wilmington, N. C.—What do you consider a fair average light for a setter pup 7½ months old? Ans. About 30 pounds.

Rabbit, Boston.—L. N. Hill, of Benson's Grove, Winnebago Co., wa, can furnish live hares, rabbits, or live game; he is an old hunter d reliable gentleman.

. A. S., Kalamazoo.—Can you inform me where I can buy, say anty bushels wild rice, and at how much per bushel. Ans. Sec last ek's issue Forest and Stream.

Pawned.—New hemlock boards should not be used in hatchrises where they are to remain in the water, as the tannin which they ntain impregnates the water and injures the fish.

Fan Heel, Wilmington, N. C.—From whom can seed of wild rice be rchased, at what price, and can you give directions for planting and tivating? Ans. See answer to J. W. in our last issue.

. D. M., St. Mark's.—Do you know any weekly paper entirely deed to yachting and boating? Ans. None devoted exclusively to hting and boating; it will be a specialty of this paper during the ason.

. S. J., Wrightsville, Pa.—I have a very fine pointer gip, and she has distemper very badly, she chews and froths at the mouth, and has t? Ans. Give her ¼ oz. fine salt, and after it has operated, give her ce a day, for a few days, a pill made of 2 grains of quinine and ½ ins of ginger.

. F. D., Phila.—1. What is the weight in general of a rider in a race, e-back? 2. What is good for the fly dirt and dust on eagles feathers? s. 1. Barebaek races are generally ridden at catch weight. 2. Wipe efully with a soft cloth wrung out in warm water.

. E., N. Y.—1. Is shad spawn a good bait for spring bass? 2. uld you advise potting it? 3. You said that you would publish in a number points in regard to spring bass bait, etc. Ans. 4. Yes. No; sew it in fine muslin and use while fresh. 3. We are prosecu our inquiries and will publish them next week.

L. Brentwood, Tenn.—1. What will it cost to have a pair bust lamed steel barrels, 14 gauge, 30-inch, fitted to stock? 2. What will the of barrels cost? Ans. 1. For a muzzle-loader $45, for breech loader 2. $35. Your first question is very indefinite.

URSCRIBER, Shakopee, Minn.—What will it cost me to get 50 pounds fish shad packed in ice sent to me here by express? Ans. It will cost about $7 at current rates, delivered at the express office here. We l be happy to be of service in procuring them for you.

RANDON, Greenwich, N. Y.—To whom should I apply to obtain "U. Ordnance Memoranda No. 15?" Is it a bound volume, and if you ow the price, please give it. Ans. Possibly by addressing Brig. Gen. V. Benet, Chief of Ordnance, U. S. A., Washington, D. C.

. S. D., Bangor.—Do you know if there is any woodcock or snipe oting in the vicinity of Moosehead Lake, or the upper Penobscot, or ny of the wild portions of Maine? Ans. There are woodcock, but have never heard of any snipe being killed in the localities you men- .

. M. A., South Haven.—Inform me if there is any work on building, ing, and sailing, small boats? Ans. No American work of which have knowledge. There are several English works but they treat sailing and-rigging yachts after the fashion in vogue across the water, ch differs materially from our own.

G. P., Waterbury, Conn.—Will you please inform us how the slidtarget at Creedmoor are made? Ans. Only one sliding or canvas get has been erected at Creedmoor and that for an experiment. You find a full description in the "Forest and Stream Rifleman's Guide," the book now in press and to be issued within a week or two.

. H. C., Glen's Falls.—Linseed oil for water-proofing linen fish lines recommended by Walter M. Brockett, a well known Boston angler. think shellac varnish better; to apply it stretch the line taut from fence to another, use a brush neatly, and a piece of oil silk in the d: draw the line through it, so as to distribute the varnish evenly.

H., Brooklyn.—1. Will you please inform me how much a good Newfoundland dog cost, and where can I get one? 2. What is the best d for a black and tan dog about three months old? 3. What is best watch dog for a city house? Ans. 1. From $25 to $50. 2. ips from the table. 3. Almost any kind of terrier, none being the f requirement.

Ex Split Bamboo.—A correspondent inquires the method of gluing ix pieces of split bamboo at once, in rod manufacture so as to secure ect joints. In reply we must say that makers regard the process as ide secret, which they are not disposed to give away. Ingenious ons may discover it, as they did, by repeated experiments. Our corondents address is mislaid.

N., N. Y.—Please inform me in your next weeks paper where there od perch fishing in the vicinity of New York? and also the best time ? Also what kind of bait to use? Ans. Between Baldwinsville and pport, on the South Side Railroad of L. I.; near English Neighbor- d, on the Hackensack River, or in Greenwood or Rockland Lakes; June 1st; bait, worms or clams.

L. W., Croton Landing, N. Y.—Will you please inform me whether a find any information in regard to the care and breeding of terra- , in any of the back numbers of your paper, and if not, where would refer me for such information? Ans. Mr. E. G. Blackford, of on Market, authorizes us to request you to call upon him for full tical information on this subject.

ONTAGUE.—Please inform me through your valuable paper which e I should take to reach Manitou. What is the fare, and chances of ing and fishing for three months, from 1st of April? Also whether ans over make their appearance outside, ten miles from hotels? Ans. he last four numbers of our paper containing thirteen columns on subject, entitled "Overland Notes."

YLISS, Taunton.—The green scum which you refer to as growing so bundantly, is known botanically as Cooniferva, or river weed, a species ge. It will do no injury to fish in running streams, but ought not allowed to accumulate in ponds, so as to choke up the space. It is lly different in character from the fungoid growths so fatal to trout. ny vegetable matter cannot injure fish.

LPH, Berlin, Wis.—1. What do sailors use to take mildew out of ? My tent is mildewed in a few large spots. 2. Where can I get od setter dog for about $25 or $35, two or three years old? Do not to pay any fancy price. Ans. 1. A weak solution of chloride of . if made too strong it will rot the canvas. 2. No one can afford ll good well-broken dogs at the prices you name.

ATEUR, Allegheny City.—In J. W. Long's "American Wild-Fowling," he describes the manner of making decoys, on page 57. Can decoys be bought as he speaks of, and where? Ans. They are for in this city by H. C. Squires, No. 1 Courtland street; the only difice being that the weight consists of a circular piece of lead instead long one; price, $18 per dozen for hollow and $12 for solid.

D. M., Pawtucket.—Does the Gordon setter stand as high as the noted breeds? Please name some noted Gordon setter dogs. Ans. Gordon setter, when properly bred, is about the size of the average rs of other strains. We have an extra fine specimen, standing 25 s high. When our book of pedigrees is published, you will find in the names of the most noted Gordon setters in this country.

LE, Sunbury, Pa.—1. Will you please reply as to what the "Marlin ovement" in the Ballard rifle consists in? I thought the Ballard patents had been sold to the Winchester Arms Company. 2. What is to be the price of the improved rifle? Ans. 1. In the adaptability for either centre or rim-fire cartridges and the automatic extractor. Messrs. Schoverling & Daly are the owners of the Ballard patents. 2. The price lists will be out in a fortnight.

J. H. D., Milwaukee.—1. Can you tell me if there is good hunting for ducks and snipe on the lakes in Southern and Western Wisconsin? 2. Are P. Powell & Son reliable gunsmiths? They advertise $15 double-barrel muzzle loading shot guns. Are they worth the money? 3. Is a gun a good shooter that will send 103 yards and stick into a board? Ans. 1. Yes, particularly near Madison, and also at Ira Bingham's, on Lake Koshkonong. 2. Yes, and the gun is worth the money. 3. Yes.

Cirrelli, Flathead Agency, M. T.—I have a pup about seven months old, by a setter out of a shepherd bitch; a natural born retriever. At fourteen weeks old he retrieved two grouse for me, in excellent style, with carriage proud as a duchess; consequently I value him, and ask your advice. His teeth are rotten, and his slobbers very badly. What should I do? Ans. The trouble no doubt arises from defected teeth—examine his mouth carefully and if you find any broken teeth remove the stumps.

Kinkey, Inwood, N. Y.—I have a pointer seven months old. When he points he stands staunch, but turns his tail up. Is this an indication of impure breed? Can it be remedied? His tail is sixteen inches long. Is not this rather long? Ans. It is a rare thing to see a thoroughbred pointer curve his tail when pointing; yet it is not positive evidence of ill-breeding. Two or three inches off his tail would improve his appearance, and in all probability prevent him from carving it upwards when pointing.

L. B., Cedar Rapids.—I have a setter pup about seven months old, that in taking him out on a long walk will fall behind, and most every time have a fit. His limbs will become rigid; this will pass off in a few minutes, then he raises up, stares wildly, foams at the mouth, and after the last fit gets up and runs as if wild? Ans. Your setter is afflicted with epilepsy, and the proper treatment consists in attention to his general health. Aperients or emetics will be likely to do more good than any other medicine.

F. H. H., Tarrytown, N. Y.—I have just purchased of Mr. Robert Walker, his cocker dog Witch; he is from Mr. S. J. Bestor's dogs Romeo and Juliet. Do you think there would be any objection to having him serve my bitch Rena, who was sired by him? I shall keep Witch at Tarrytown all summer for stud purposes, as I think he is something extra? Ans. Many persons in England, and some in this country, inbreed in that way, and the produce is frequently very fine, yet it is not the best way to breed.

C. S., Savannah.—Are there any marks about dogs to tell how old they are? Ans. Until a dog is 18 months of age his upper front teeth are rounded on the edge; after two years old they begin to square off, and gradually wear down and shorten, until, when the dog is six years old, they are nearly even with the gums. The lower teeth are apt to wear out earlier. The appearance of the eye is also an indication of age, and all dogs of dark colors show their years by the growth of white hairs about the muzzle.

W. H. A., New Bedford.—I have a pointer bitch six months old, was taken with distemper about six weeks ago and after being sick about two weeks seemed to get quite smart, but was again taken with shivering and staggering, sometimes falling down. Her apetite is good; her eyes run some. She appears lively and playful, but cannot get around without falling. Can you tell me what to do for her? Ans. Keep her in clean comfortable quarters; give her plenty of strong food, and she may, in time, come around all right.

Seneca, Syracuse.—In the recipe you have often given for water-proofing canvas or drilling, you say to soak the canvas in the solution for a considerable time. Does this mean two or three hours, or two or three days, or what? Ans. In a bucket of soft water put half a pound of sugar of lead and a half a pound of powdered alum; stir this at intervals until it becomes clear; pour it off into another bucket, and put the garment therein, and let it lie in for twenty-four hours, and then hang it up to dry without wringing it.

T. F. W., New York.—1. Where can I get pictures of the American teams of 1874-5, with diagrams of their shooting? 2. What gun would you recommend for a beginner to use? 3. What day does the American Rifle Association hold their monthly meeting? Could I get a copy of their by-laws by sending for them? Ans. 1. In a pamphlet issued by the Amateur Rifle Club entitled "The International Rifle Match?" 2. A short range or sporting rifle, of not over 32-calibre by any good maker. 3. First Tuesday in each month. Yes.

G. C., Brooklyn.—1. You told "B. A. B" there was fishing in South Oyster Bay. Will you inform me of what sort? 2. Please inform me of some place on Long Island for trout fishing, if not of much importance. 4. How far would a person have to go to get good trout fishing, and in what locality? 4. Are trout flies the best bait for trout? Ans. 1. Bluefish, weakfish, porgies, and sea bass. 2. Only private trout waters on Long Island. 3. Go to Milford, Pa., or Port Jervis, on Erie Railroad. 4. They are; but unscientific anglers use worms.

F. P., Seneca Falls, N. Y.—A and B shoot a match at pigeons 31 yards rise, each choose a judge and judges choose a referee, each choose a man to trap for the other. A traps a bird for B with a wing clipped, with the knowledge and consent of his, A's judge, is there any rule which justifies A in putting a mutilated bird in the trap, or his judge in being a party to it, he having a pecuniary interest in the match? Ans. It would be a violation of all decent rules for a party to put a mutilated bird in the trap, and also for one having a pecuniary interest in the match to act as judge.

H. R., Philadelphia.—1. I have ten pair of quail to let out. Is this early enough? When do they mate, and do they have their young as early as May. 2. What is the close season for woodcock in Pennsylvania? Ans. 1. Your quail should be let out as soon as possible, and in doing so you should be careful not to frighten or scatter them. Open the box quietly, walk away, and let them find the way out undisturbed. They generally mate early in May, and hatch out about the 4th of July; some earlier and some later. 2. The new law which has passed the Pennsylvania Legislature makes August 1st the expiration of the close season.

Spunk, Phila.—My black and tan slut (5 months old) is troubled with eruption on her head, back, and fore-leg. The places are not sore, but keep her scratching until the hair is now worn off. Two or three of the spots first appeared similar to a ring worm, then became dry and hard, the skin finally coming off. She appears as well as ever and eats well. Has been kept clean, having washed her twice a week with Nadir's dog soap, so don't see why she should have mange, if it is that. Please inform me what to do for her? Ans. Take ½ oz. flour sulphur, ½ oz. powdered charcoal, 2 oz. lard. Apply the ointment—occasionally washing the parts affected—feed little or no meat.

G. A. F., West Meriden, Ct.—Will you please inform me through your columns whether either Colvin's or Hegeman's canvas boat is perfectly reliable for a trip down river in swift water, along rapids, &c., and if so, which is preferable for a trip into the heart of the wilderness where canoes are usually the only vehicle of travel. Do you consider either as desirable as a canoe? Ans. For general article on "Portable Boats," see Forest and Stream, Vol. V., No. 3, page 40; and for article describing Colvin's Boat, see Vol. IV. No. 22, page 347. We have mailed them to you. We think that Colvin's boat, by its shape is better adapted to rapids than Hegeman's is. Both are preferable to a canoe, if a great deal of carrying or tough work is to be done.

W. F. S., Savannah.—I have a very valuable setter about sixteen months old that was kicked or hit by some one, on the fore-leg. I have consulted several of our physicians, and they say that it will get all right again; they say let Nature work its own course. He carries his leg about one inch from the ground, and seems as if he is afraid to walk on it, but at same time he can put it on any place, or use it in any way, but walking on it. Please let me know what you think about it? What ought I to do for it? Would it be safe to let him go, and let Nature work its own course? He has been troubled for the last four weeks. Ans. The physicians you have consulted have taken a correct view of it we think.

Subscriber, Rochester.—1. I have a pointer pup four months old, he seems to be quite lively and playful the most of the time, but still he wont eat enough to keep a humming bird alive. He occasionally has spells of vomiting. Yesterday he had a bad fit, being the second one within a month? What shall I for him? 2. What are the quantities of shellac and alcohol to make varnish for fly rod; have mislaid the paper, Vol. IV., containing receipt? Ans. 1. Your pup in all probability is afflicted with worms —have mailed to you some powdered areca nut with directions for giving it. 2. As much shellac as the alcohol will dissolve. Spread evenly, dry thoroughly, put on three or four coats, and rub down with rotten stone.

Flushing, N. Y.—I have come into possession of a splendid looking dog, red Irish setter, which is said to have been originally imported by a Mr. Heath, of Staten Island, and called Duke, (imported). I have no means of ascertaining the pedigree of this animal and would like to ask you if you can furnish me any information. The dog is now eighteen months old, of a deep red, very brilliant color, well feathered as to tail and legs, large frame, four white feet, white on breast and nose. He stands twenty-five inches at his shoulders. Of course I have no opportunity of trying him on birds at this season, but in the field he seems to be thoroughly broken? Ans. We do not know the dog, but should think you could get the desired information from the gentleman who imported him.

G. F. P. Oneida, N. Y.—1. A friend of mine has an English "cocker" that is a very good dog in many respects, but has one very bad habit, and that is, the moment he gets in the woods and gets a "sniff" of game he will commence barking, and keeps it up until he takes him out of the woods. He is all right in every other respect. Can you suggest a remedy? 2. Can you suggest a remedy for a timid dog? He have a very nice cocker bitch that has been almost whipped to death, time and again (by the man who gave her to me) and she is so very timid it is almost impossible to use her at all? 3. What No. Orange Lightning Powder shall I use in a 12-gauge breech-loader, and what number in a 14-gauge? Ans. 1. It is the nature of the cocker or Springer spaniel, when he strikes the scent of game to bark, and for that they are valued. 2 Nothing but use and gentle treatment. 3. No. 4 for either.

W. G. M. Cambridge.— 1. Will you please inform me what the matter is with my dog. He has got a large hunch under his jaw, the size of a hen's egg. It must have been coming on gradually for a day or so, although I did not notice it till yesterday morning. Will you please tell me what I can do for it, and what is the cause of it? His nose is cool and moist, and his appetite is very fair—it don't seem to affect his ailing? 2. I noticed in your Answers to Correspondents, some one asking how old a dog should be before you begin to train him You say six months. Have I done wrong in learning mine earlier? I bought my dog when he was six weeks old, before he was three months old he would charge, fetch, and stand on a dead bird, as staunch as any old dog? Ans. 1. As soon as the enlargement becomes soft to the touch, lance it, and it will discharge and soon be well. 2. There is no great impropriety in teaching your pup as you have, but there is such a thing as overbreaking a pup so young as he, and that you must guard against.

W. H. B., Parkersville, Conn.—1. Two weeks ago I sent you a score (70 out of a possible 75) made me with a Frank Wesson 18 in target pistol 32-100 at 100 yards. You thought the shooting was excellent if I did it without artificial rest. If would say that I did it off-hand without artificial rest, and since then have made 73 out of a possible 75. Enclosed you will find digram. I cannot raise the back sight high enough to shoot 200 yards. Would you advise me to have another hole made in the rear sight or have a longer screw, so as to raise the sight higher. 2. Would you advise me to get a 28-inch of 32-inch shot gun? Ans. 1. If the target was made off-hand and without the skeleton stock or shoulder piece which accompanies the Wesson pistol, it is simply wonderful. We would not advise you to alter the sights, unless it is by raising the screw, as 200 yards would be almost beyond the range of the pistol. 2. We prefer 30-inch barrels, but if one is limited to either 28 or 30 inch his physique should determine the question. A tall man could handle the longer barrel best.

C. F. H., Mass. I have a pond two hundred and twenty-five feet long thirty feet wide, and from a foot to eight feet deep. Former owner, raised some trout, but now but a very few left. Would the pond be suitable for black bass, and which pays best? The pond is fed by springs, flowing out always. Where is the nearest place to get fry or yearlings? What is price for each? Is goldfish best food for trout? is it good for bass? How many would I require in stock ponds? Ans. If trout have lived in your pond before, they will again under the same conditions. Black bass require that some portion of the pond should have natural rocky bottom, with considerable depth of water at that point. If you will write to Stone & Hooper, Coldspring Hatching House, at Charlestown, New Hampshire, you will obtain all that you desire, as they have just now made special arrangements for supplying bass and trout for stocking purposes. If you will put a dozen spawners (bass) into your water next May, they will spawn in the summer, and in three years you will have a well stocked pond. Spawners cost $2 apiece. Fish will eat any kind of small fry.

W. W. A., Philadelphia.—Will you please inform me how to make rubber cement, such as shoemakers use to put on invisible patches? I want to use it to fill in the seams of a canvas hunt. It seems to be somewhat of a secret, as I have asked, but could not get any satisfaction from my shoemaker, except that he uses chloroform, with some other ingredient, and not naphtha, as it will not hold? Ans. Cut virgin or native India rubber with a wet knife into the thinnest possible slices, and with shears divide these into threads as fine as fine yarn. Put a small quantity of the shreds (say one-tenth or less of the capacity of the bottle) into a wide-mouthed bottle, and fill it three quarters full of benzine of good quality, perfectly free from oil. The rubber will swell up almost immediately, and in a few days, especially if often shaken, assumes the consistency of honey. If it inclines to remain in undissolved masses, more benzine must be added; but if too thin and watery, it needs more rubber. A piece of rubber the size of a walnut will make a pint of the cement. The cement dries in a few minutes, and by using three coats in the usual manner, will unite leather straps, patches, rubber soles, backs of hoots, etc., with exceeding firmness. The India rubber, vulcanized, can be obtained at most large stores where rubber goods are sold, and at some drug stores.

W. H. C., Mechanics Falls.—A hunter discovered a squirrel on the trunk of a tree, and attempted to bring his gun in range to shoot him, but as often as the hunter advanced part way around the tree to get sight of the squirrel, the squirrel would move on in advance, and thus elude him. *Query:* Provided the squirrel and the hunter continued in travel in the same direction till they both completed a circle around the tree, did the hunter travel around the squirrel? Ans. We are not disposed to shirk the awful responsibility that rests upon us in deciding this long vexed and still undemonstrated problem. To meet the case fully: Find the centre of a circle, to represent the tree. Let the circle itself represent the track traveled by the hunter. Draw a radius from the centre to a point on the circumference where the man stands. Draw another radius from the circumference to the point on the tree where the squirrel stands. Now revolve your disc, and you will observe that both man and squirrel progress *equo passu*, and that the man has not gained an iota in his effort to "surround" the squirrel. *Per contra* let the centre of the circle represent a tree with a squirrel on it: let a given moveable point on the perimeter represent the hunter. Let this point travel around the circle like a wagon around a race track, and you will see it surround both the tree and the squirrel no matter whether the squirrel moves or not. Take a common school orrery and watch the motion of the planets around the sun, some moving in lesser orbits and others in greater, and tell us if you can, whether Jupiter travels "around" the earth, or Mars around Mercury.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCULCATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
[POST OFFICE BOX 2832.]
123 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty-five per cent. allowed for five copies and upwards.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent.; over six months, 30 per cent.

NEW YORK, THURSDAY, APRIL 6, 1876.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Editor.

WILLIAM C. HARRIS, Business Manager.

—The last Grand Promenade Concert of Gilmore's 22d Regiment Band was given on Saturday evening last. The attendance on this occasion was larger than at any previous concert. The New York Choral Union under the direction of Mr. Gilmore, sang several pieces in very praiseworthy style, among which Dr. Oliver Wendell Holmes' "American Hymn," music by Keller, was received by the large and fashionable audience in a very flattering manner. The overtures and selected pieces by the band were all performed in the usual masterly way; while the solos of Mr. Arbuckle, on the cornet, and Mr. E. A. Lefebre, on the saxaphone, were received with a perfect storm of applause. During the evening Mr. Gilmore was decorated with a badge of honor, given by his numerous friends, for which he returned thanks in a neat little speech. The Band took their departure on last Sunday for San Francisco, where they will give a series of musical entertainments. We wish them all success.

—The "*Rod and Gun*" is publishing a series of letters, more or less scientific, from Greene Smith, Esq., relating to the southwest coast of Florida, covering in great part the course followed by our correspondent, "Al Fresco," two winters ago. Mr. Smith is making a collection of birds and creatures, and his observations will, no doubt, result in valuable contributions to the rather limited knowledge we have of the natural history of that section. Greene Smith has a happy faculty of combining pleasure with well-directed labor, which his friends will readily acknowledge.

—A gentleman who has passed the winter on Indian River and the adjacent waters in Florida, writes:—

"Prospects brighter on the Halifax River, many new settlers are coming in; land is rising in price, lots in Daytona, which two years ago were selling at $200, are now worth $400. Three years ago two small vessels could do all the business between these rivers and Jacksonville, now there are five, besides two lost this year on the bar, and they all find plenty of freight; and probably a steamer will be put in the water by the next season."

—A new "Foot-and-mouth Disease" is making rapid progress in England. Its other names are Rinks, and Spelling Bees.

—A few English snipe have been killed near Bergen Point and on the Hackensack Meadows, in New Jersey, but the flight has not yet arrived.

CHOKE-BORING.

IN reply to numerous questions as to what comprised choke-boring, or in what manner the process was performed, we have answered to the best of our knowledge on the subject, that it consisted in enlarging the bore for a certain distance within the barrel near the muzzle, leaving it at the original size both above and below the enlarged part. We might have qualified this statement somewhat by remarking that in the barrels of some manufacturers the portion of the barrels at or just within the muzzle was somewhat smaller than the bore just behind the enlarged portion, but the difference, if any, is trivial. A correspondent who had asked for information on this subject, after repeating our reply, says:—

"All the choke-bored guns that I have seen appear to be constricted in bore just at or within an inch of the muzzle. The editor of the *Field* in 'General Remarks of Gun Trial, 1875,' says of choke-boring: 'It is now generally admitted that there are at least two distinct modes of boring the new guns, well represented by Mr. Greener and Messrs. Scott,' and that by use of his callipers he is 'in possession of the exact measurements of these two methods,' which he is confidentially restrained from disclosing, but states that 'a point common to all modifications he has examined is the existence of a contraction *at the muzzle*.' The question is an interesting one in mechanics, and a more complicated one than supposed by many, if your answer be accepted and understood, that the enlargement of the bore is to be commenced at the distance of six inches from the muzzle, and then extended downward toward the breech for the extent of three inches more, say in a 30 or 32-inch barrel. May I take the liberty to ask if your reply is based upon certain knowledge from a credible artisan of skill and experience in this line, or from actual careful measurements, and in what brand of gun this method of choke-boring may be examined?"

The editor of the *Field* might have gone still further and stated that there were three or even four distinct modes of choke-boring, for Messrs. Dougall and Pape claim methods of their own, each differing, or supposed to differ, materially from the others. Since receiving our correspondent's letter we have taken the opportunity of examining guns of Messrs. Scott and Greener, and certainly find a marked difference in the *apparent* mode of boring. Our own error was in stating, upon hearsay, that the constriction commenced at six inches from the muzzle, and then extended for three inches towards the breech. In a gun of Messrs. Scott, which we have recently examined, and which was an extreme choke-bore, upon looking in the muzzle (with the breech open) there appeared to be a distinct shoulder at a distance of say six inches from the muzzle; precisely such a shoulder as *appears* in the chambering of the gun. This settles the question as to the enlargement of the barrel, which must exist beyond the shoulder and towards the muzzle. From this apparent shoulder the bore *gradually* decreases until the muzzle is reached; we say gradually because in looking from the barrels no other shoulder, or apparent shoulder, is to be seen. In the extreme choke-bore of Messrs. Greener we believe that this shoulder is to be seen, but we have had the opportunity of examining only his modified choke-bores, in which there appeared to be only a gradual constriction of the bore. The *Field* editor is correct in one sense, as there certainly is a contraction at the muzzle as compared with the bore a few inches beyond it. If we understand the theory of choke-boring correctly—and we confess to having found no one to explain it satisfactorily—it is that by enlarging a portion of the bore and again constricting it, the pellets which have a tendency to diverge from the common centre are again brought into a uniform position and take their direction with the entire charge, and in a more compact and gradually expanding form. This might account for an evenness and closeness of pattern, but one would imagine that it would be at the expense of penetration, for an enlargement in the barrels would, we should suppose, permit of an escape of the gasses which would lessen the effect of the explosion of the powder. In the first choke-bore guns used in this country a false muzzle of a smaller bore was screwed on the gun barrel; but this could only be used in single guns. Mr. Dougall, in his admirable work entitled "Shooting, its Appliances, Practice, and Purpose," says that closeness and velocity are antagonistic, but that he has hit upon a method which renders them compatible and at the same time without undue wear on the gun. What that method is he is no more ready to disclose than are Messrs. Scott, Greener, or Pape. That an *enlargement* of the bore near the muzzle is a portion of the process is made additionally apparent by the fact that the first question a gunmaker asks when one proposes to have his gun altered to the new bore is, "are the barrels worn thin, and will they stand being bored out?" In fact if choke-boring was merely a constriction of the barrels at the muzzle, how could old guns be choke-bored?

Long ago we alluded to an old fowling piece, brought here during the war of the revolution, the barrel of which was choke bored, and which bore the date of 1774 stamped upon it. The reader may find additional confirmation of the fact that the process is not a new one, and of the triteness of the saying that "there is nothing new under the sun," by referring to Miss Edgeworth's "Ormond," written in 1798. In the edition published by Harper Bros., on page 137, will be found the following:—

"O'Shane, besides being a good shot was an excellent mechanic; he beguiled the hours, when there was neither hunting or shooting, in a workshop, which was furnished with the best tools. Among his other occupations at the work bench, he was particularly skillful in making and adjusting the locks of guns, and in boring and polishing the inside of their barrels to the utmost perfection; he had contrived and executed a tool for enlarging the barrel of a gun in any particular part, so as to increase its effect in adding to the force of the discharge, and in preventing the shot from scattering too widely."

CENTENNIAL BUM-BOATS.—Philadelphia promises to have a large floating population, in a literal sense, during the continuance of the Centennial Exhibition, and the rivers will be crowded with as remarkable an array of craft as can be seen on the Pearl River at Canton, where thirty thousand persons live, move, and have their being, from one end of the year to the other, with nothing but a plank's thickness between them and the water. We hear on every side of parties being formed, and schooners being chartered, both as means of conveyance to Philadelphia, and for homes while there. All along the coast of New England, and even as far as New Orleans, such parties are being formed; old schooners are being fitted up with new cabins, and bunks, and dining saloons arranged in the holds, until they are transformed into floating hotels or club-houses. It would remind an old Californian of the days of '49, when crewless vessels were made to do duty as lodging-houses. On the south side of Long Island several vessels are being fitted up for the purpose of carrying Centennial parties, and if the reports we hear of the charges proposed by hotel and lodging-house keepers are correct, this mode of "doing" the Centennial will be very popular. Five dollars per day appears to be the minimum price, at which the stranger will be "taken in," while a less amount per capita would cover the entire expenses of a yachting party, and include the important item of transportation. And then the jollity and fun of such a party when properly composed can scarcely be described. A gun and a set of colors are important additions, and the expense of powder is well repaid in the noise and smoke attained, as well as the similar acknowledgments received in return. The trip to Philadelphia by water is amply diversified with sea and river sailing, and there is just enough "outside" work in it to make it interesting. Long Branch and Cape May can be visited *en route*, and perhaps a school of blue-fish might be sufficiently accommodating to put in an appearance. We know of several such parties and vessels fitting out, and if we can give any information, or be of service to our readers in bringing them together, it will afford us pleasure to do so.

MANN'S REACTIONARY HEALTH LIFT is becoming quite an interesting means of amusement, and profit at the Produce and Cotton Exchanges, each of which has several of the machines in use. Trials of strength and lifting matches are always in order, and competitive teams frequently vie with each other for first place. The stimulus of competition keeps the machines in constant motion, and the exercise is doing an amount of good which the members cannot at present realize. The theory of its use is to promote free circulation of blood. When the lift is made, with the body in its proper position, every muscle, nerve, and blood-vessel is compressed and tautened to its fullest tension, circulation is checked for the instant, and then a reaction follows which sends the blood like a flood from its fountain head into the remotest vein, expelling foul secretions, breaking away obstructions, and reopening tubercles, vesicles, and cells long since closed by disease or disuse. By discretion in not over-doing or straining, the best results quickly follow the first trial. Many men whose maximum lifting power at the outset was only 300 lbs., have acquired such nerve and vigor that in three months they have lifted 700 lbs. A weight of 900 lbs. is not an extraordinary lift for a person of medium size, while one man who weighs but 140 lbs. lifts over 1,200 lbs. This is done without straps, or any artificial appliance.

Of course increased vigor promotes appetite and helps digestion; and healthy consumption of victuals in large quantities increases weight; so that while the exercise keeps a man in professional form, making him lean, hard, and fibrous, it also increases his weight and reduplicates him. It has taken a long time to bring these machines into popular favor, but now their universal use is assured among those who can spare a dollar or so each week to pay for their practice. Ten minutes a day is all that is absolutely necessary to devote to the exercise, for it is not the continual use that accomplishes the result desired, but the reaction that follows the isolated effort. Wherefore we find that in economy of money, time, and force, this instrument is incomparable, and the exercise it affords desirable above all other modes in vogue. There are exercising rooms in all the principal cities, and one great advantage to the holder of a ticket is that it admits him to all alike.

THE CENTENNIAL AQUARIUM.—The foundations have been put in, and work commenced on the great salt water tank. This aquarium is to be twenty feet long by seven wide, by four deep; it is to be of cedar with a front of glass one inch in thickness. The largest fresh water tank is to be of the same width and depth, but only ten feet long.

The Ohio Fish Commission, through their Secretary, Mr. J. H. Klippart, has agreed to furnish a collection of the fishes of that State, and to keep the tanks supplied from time to time in case of loss. We hope soon to hear that New York, Michigan, and other States having fishes peculiar to their waters will follow suit and make this a grand display of American aquatic life. Since the offer of a ten foot aligator was made in our last by Mr. Labadie, Messrs. C. Crossman & Son, of the Crossman House, Alexandria Bay, N. Y., have offered to forward a muscalonge of the largest size caught between this and the opening of the Exhibition at their famous fishing grounds among the

Thousand Islands, and Mr. Greene Smith will bring turtles and other specimens from Florida. We have made arrangements to publish the arrivals at the aquaria, after the manner of those at Central Park, etc.

GAME PROTECTION.

PROTECTING MIGRATORY BIRDS.—It is a question whether any law protecting migratory birds such as ducks and snipe during their northern flight, will find favor among all sportsmen unless it is one passed simultaneously by all States through which the birds pass. The old argument is brought forward, "if I don't kill them some one else will," and consequently the birds are slaughtered. We are not in favor of stopping spring snipe shooting for reasons before expressed, that the birds are uncertain in their habits, and that if the law is passed there will be nothing left for sportsmen to work their dogs on in the spring. And, again, there are so few killed in this State that they would not be missed. Still, if New Jersey passed such a law we should advocate it in this State also. There is this to be said in its favor, that if spring snipe shooting was abolished there would be fewer woodcock killed during the flight, or while they were preparing to nest. With ducks, however, it is different; their flight is regular and certain, and if killed or shot at indiscriminately during their northern voyage the survivors will choose another route on their return; to say nothing of the decrease in numbers.

The Monroe County Sportsmen's Club, one of the oldest organizations of the kind in the State, held a meeting on the 23d ult., to consider the proposed amendments now before the Legislature, when the following resolution was passed:—

"We deem it impracticable for any State to attempt to protect any kind of migratory game bird whose natural breeding grounds are not within the limit of said State. Further, we see no practical way of protecting all migratory game birds on their flight from their southern winter home to their natural breeding grounds in the extreme northeast, except by the enactment of a national game law which shall bear equally upon each and every section of the country over which such birds pass in their flight. We consider it an unjust discrimination against the inhabitants of this State to prohibit the spring shooting of snipe within its limit, while no such prohibition exists in the adjoining States and the Canadas. And we further see no reason why snipe should be protected to the exclusion of ducks, geese, brant, and other migratory game birds; and are in favor of the law remaining unchanged until all spring shooting of migratory birds is regulated by a national law."

MORRIS COUNTY SPORTSMEN CLUB.—This association is about applying to the New Jersey Legislature for an act of incorporation. The club has brought suits against several parties for killing quail out of season, and caused them to be fined to the extent of over seventy-five dollars.

—The Hazleton (Pa.) Sportsmen's Association organized the 21st inst. J. C. Tomlinson, President; S. D. Engle, Vice-President; Jos. Silliman, Secretary; Geo. Gorman, Assistant Secretary; E. S. Dond, Treasurer; Wm. Lauderbach, Thos, McNair, Barton Pardee, R. Fitzpatrick, John N. Shapley, Frank Pardee, and John P. Youngman, Directors.

—The Game Protective Club of Quebec have been doing a heavy business lately in prosecuting violators of the game laws, no less than fifteen cases having been in hand since December. Several of the parties have been convicted and fined.

—The law prohibiting the killing of moose in the province of Nova Scotia expires next year; in the meantime moose are again becoming plentiful. A law has recently been passed in New Brunswick prohibiting the killing of moose, deer, and caribou for three years.

—We noticed recently that steps had been taken to form a game protective society at Guelph, Canada. The committee appointed have since made a report which was adopted. The society is to be known as the Wellington Game, Fish, and Harmless Birds' Protective Society. The following officers were elected: President, E. V. Thompson, Sr., Guelph Township; Vice-President, James Webster; Secretary Treasurer, Judge Chadwick; Solicitor, R. Oliver; Central Committee, Chas. Sharpe, C. Dunsford, and George Newton; General Committee, George and J. Atkinson, A. Anstee, E. V. Thompson, Jr., J. West, and A. Blythe, Guelph Township; A. R. Davis and Hiram Anderson, Guelph Town; W. Gay, Elora; John Watt, Fergus; P. M. Barker, Orangeville; Dr. Allen, Arthur, and J. Broddy, Erin. The Central Committee will appoint a General Committee.

—A very important amendment to the Game Laws of Great Britain, as far as Scotland is concerned, has recently passed a second reading in the House of Commons, notwithstanding the opposition of the Government. It excludes hares and rabbits from the list of game, and gives all game over to the tenant unless a special clause in the lease, specifying a consideration, reserves it to the landlord. If there is damage done beyond the amount of the consideration the landlord must pay it. Instead of country justices having jurisdiction over game cases they are to be handed over to the sheriff.

TOLEDO, Ohio, March 25th, 1876.

EDITOR FOREST AND STREAM:—

The sportsmen are much exercised at the prospect of a new bill before the Legislature, proposed by the Grangers, making it a penal offence to be found with a gun on any one's premises without permission. Heretofore the law was—and no one complained at it—that any one could hunt over fields where no public notice was given. A transgression of the law subjected the offender to fine and imprisonment. It is to be hoped that there will be influence enough brought to bear to defeat this bill, otherwise good bye to rural sports in Ohio. In this case the lover of field sports can take indulgence only at the will of the granger. It may have a tendency to preserve game, if this is any consolation.

The experiment of the Fish Commissioners of this State has been very satisfactory this spring. An early hatch of white fish has already stocked the lake, promising abundant reward. The warm weather advanced the young fry, and they had to be disposed of by deposit in the adjoining waters at a much earlier season than usual, the ultimate results of which may be questioned, at the same time giving no uneasiness in the experiment to the commissioners. The hatching of the eggs on the natural bed was in advance of those in the hatchery, as in the latter place, the water was kept cooler, keeping back the fry; how many days is not known, nor, indeed, may not be very material. There were some doubts of the adaptability of these waters to the successful hatching of white fish. This idea is entirely removed, since the results are equal to the highest expectation. I was informed to-day by one of the commissioners that the proportion of eggs hatched was fully ninety-five per cent. This is good enough.

A meeting of the respective Commissioners of Ohio, Michigan, and Wisconsin was had last month in Detroit, as I understand, to urge a uniformity of law in the protection of fish. Mr. Wilmot, of Ontario, was expected, but not present. He, however, concurs in the plan proposed, which is:—

First—It shall be unlawful for any distillery, coal-oil refinery, or gas-works, to discharge any refuse or offal from their works into any of the lakes or rivers in or adjoining the States represented, or into any stream putting into them or either of them.

Second—It shall be unlawful to catch in any pound, or sweep-net, any white-fish, or lake trout, between the fifteenth day of November and the tenth day of September.

Third—It shall be unlawful to use any gill, drag, or float-net, at any time for catching fish in any of the waters herein mentioned, within ten miles of the shore.

Fourth—It shall be unlawful to catch, kill, or offer for sale any white-fish weighing less than one and a half pounds.

Fifth—A base shall be established in seven feet of water along the shores, and it shall be unlawful to extend any pound net more than one mile from such base line; *provided*, that in the indentations of the lakes and bays said pound nets may be extended one and one-quarter miles from said base line.

The committee unanimously recommend the passage of laws in conformity with the foregoing plan, with suitable penalties to enforce them.

Dated at Detroit, the 7th of February, 1876.

JOHN J. BAGLEY, Mich.,
GEO. CLARK, Mich.,
WM. WELCH, Wis.,
EMERY D. POTTER, Ohio.

This bill is already before the Legislature of Wisconsin with assurance of success, and soon will be presented in the House in this State, without a doubt of its becoming a law.

The wise heads in Columbus are tampering with the dog law. Not satisfied with present enactments, they seem to hold a spite, not only against the sporting fraternity, but against every class of dogs likewise. Some mullet-head has proposed a tax of three dollars on each dog, besides a property tax per valuation, given under oath, and fining the owner of any dog five dollars that may be found at large or astray from the premises of such owner, at the same time legalizing the privilege to any person and the duty of any constable or marshal to kill such dogs astray, for which the murderer will be entitled to $1.00 from the county treasury. If at any time it shall appear to the county auditor that a dog has not been returned, he may return the dog himself and proceed in respect thereto as if originally made. In case a dog has been improperly assessed to the owner of certain premises, the owner thereof may have cause of action against the owner of the said dog and recover, and the judgment debtor shall not be entitled to any exemption as against the collection of such judgment.

Here you have legislation with a vengeance. Tell it not in Gotham. It is to be hoped that there is some humanity in the Legislature, if there is but little sense. Such a law will hardly pass, but no one can premise what are the conceptions in the fertile brains of our wise Solons. B.

—An act has passed the Legislature of Wisconsin, and been approved, of which the following is an abstract:—

SECTION 1. It shall not be lawful for any person, at any time, or in any place, upon any of the waters of Lake Koshkonong, in this State, to shoot at, catch, kill, wound, destroy, or to pursue any duck or other wild fowl, by the aid, means, or use of any float, punt-boat, sneak-boat, or similar device or structure, however known or called; nor shall it be lawful for any person to build, or to use, for the purpose of hunting or shooting duck or other wild fowl upon any of the lakes, rivers, streams, or marshes in this State, any sunken or floating boxes or batteries, or any other similar device or structure however known or called, or to sail for any wild fowl of any kind in, or shoot at them from any vessel propelled by steam or sails, or from any boat or other structure attached to the same.

SEC. 2. Any person violating any of the provisions of this act shall be punished by a fine of not less that twenty-five dollars, nor more than fifty dollars for each and every offence.

The other sections of the act refer to the mode of collecting the penalties.

LAKEVILLE, Litchfield Co., Conn., March 25th, 1876.

EDITOR FOREST AND STREAM:—

I have been glad to learn, through your paper, that an effort is being made to have the game laws of the several States amended, so as to harmonize more perfectly. We of this section, living as we do on the borders of three States (Conn., N. Y., and Mass.,) should be delighted, could such a thing be brought about. It seems to me that nature herself indicates the proper season to begin the shooting season of woodcock. If the summer shooting could be abolished (July and August), and the season begin, say on September 1st in this climate, we should then have full-fledged strong birds to shoot, and more of them. In our cold, hilly country the birds are generally through moulting about that time, and they generally leave us for a warmer climate about the middle of October, though an occasional bird is to be found about spring holes in the early part of November. This arrangement would give us six weeks of the best shooting, and protect the birds till they are able to fly. Our present State law prohibits all shooting till October 1st. That may do for sportsmen near the Sound, but for us on the hills, who have no duck and bay bird shooting to speak of, it nearly amounts to no shooting at all at woodcock. W. H. WILLIAMS.

—Woodcock are breeding already in large numbers in various parts of New Jersey, and also on Staten Island.

The Kennel.

HOW TO TEACH DOGS TO RETRIEVE.

ONE of the most important considerations for those who are raising and breaking dogs to shoot over is that of properly teaching them to retrieve. In our opinion there is nothing more vexatious while shooting than, after having made a good clear shot, you find that you have dropped your bird across a stream, or deep muddy ditch, or in some dense briery covert where, if your dog is not a retreiver, you are obliged to turn your back upon the bird and leave it. And this thing must frequently happen with those who shoot over a dog not broken to this accomplishment. As for ourselves, we had rather miss half a dozen shots than leave a dead bird, consequently we invariably make it a point to have our dogs nicely broken to retrieve when ordered.

When we commenced shooting on the wing, full fifty years ago, and for a few years afterwards, we did not use retrieving dogs, taking the same erroneous view of it then that is entertained by a few shooters of the present day, that retrieving dogs could not be well controlled, and that by frequently having birds in their mouths it injured their scenting powers. In looking over an old diary, we find that it was in the year 1830 we were introduced to a gentleman named Cober, a German, then residing in Philadelphia, and from him obtained much valuable information and instruction in the management of dogs, particularly as to the proper mode of breaking them to retrieve, and by him we were presented with the first force collar, check cord, and puzzle peg we ever saw.

There are two modes of teaching dogs to retrieve, one of which is to take a pup of, say five or six months old, in a room, or some place where he cannot get away, and by rolling a ball, or some such object from him, he will soon become fond of running after it, pounce upon it, and bring it back when called. After he does this well the wing of a bird should be attached to the ball, and then, after a few lessons of this kind, he will readily bring a bird thrown for him. And almost any person with a little skill and patience can soon make his youngster fond of retrieving in this way. This is what is called teaching a dog to retrieve in *play*, but it is by no means the *best* mode, for the reason that if a dog thus broken should mouth a bird, and not fetch it properly, and be punished for the fault, it would break up its retrieving altogether. Hence the only proper way, in order to have a first-class retriever, is to break him "under the whip," which is to first let your dog know what is required of him in the matter, and then to *make* him do it. It is better, however, before a dog is thus broken to retrieve, that he first be partially or fully field broken, and that he is not less than ten or twelve months old when taken in hand; and then the first thing to be done, if he has a propensity to rush in, pounce upon and bring things voluntarily, is to break up all that kind of nonsense, and let him know that there is to be no play about it, but business from the start; and before giving the first lesson, a good strong check cord and force collar must be provided, and as the first lesson will be a disagreeable one, much care should be taken that the dog cannot escape from it. If he once escapes from his lesson, the difficulty afterwards is much greater, as he will continue to look for a mode of getting away instead of attending to his lesson. In breaking a dog to retrieve, nothing better can be used for the purpose than a corn cob, or a newspaper compactly wrapped with twine. The first thing to be done is to teach the dog to "sit down," hold up his head, and take the object from the hand, and in order to do this his mouth must be opened and the cob inserted as a bit is placed in a horse's mouth, at the same time using the words "take it." If he becomes stubborn, and refuses to take it, you must twitch him with the check cord, or rub his gums with the cob until he opens his mouth and takes it, and will hold it until he is ordered to "let go." After he gets to fairly understand this lesson, the next is to compel him to walk around the room with it in his mouth. The chances are that the first step he takes he will drop it; if so, box his ears, replace the cob, and compel him to walk around with it until he is ordered to "let go." There is very little trouble in teaching almost any dog to do this, but the greatest difficulty is in making him pick it up off the floor, and this should not be attempted until he is thoroughly confirmed in the above. Then the cob must be held a few inches below his mouth, and he be made to take it then; and when perfect in that, hold the object a few inches lower, and very gradually hold it lower and lower until he will take it off the hand on the floor, and by gentle force he will soon come to understand what is required of him, and will take it off the floor when ordered. After he is confirmed in this the object may be thrown some distance, and the dog soon be made to "go fetch," "come in," "sit down," and hold it until he is ordered to "let go;" and after thoroughly taught to do this he should be taken to the field, made to "down charge," and covering his eyes with the hand, throw the cob so he will be compelled to find it with his nose, and fetch it. It frequently happens that after a dog has been perfectly broken to fetch a cob, ball, or any such thing, he will not at first fetch a bird. But by placing a bird in his mouth, and compelling him to carry it a little way, he may soon be confirmed in retrieving properly. Much care should be taken not to confuse the dog by undertaking to teach him too much at a time, and that the disposition of the dog should be steadied, and that he is given no more or less punishment than is absolutely neces-

sary. A skillful breaker can break a dog of any age to retrieve in a short time, and find it best to occupy ten or fifteen days in perfecting them. But there is a knack in thus breaking a dog to retrieve that very few shooters have, or can attain. Among a host of persons who have expressed to us a desire to know how to do it, and to whom we have exemplified the process, not more than one out of ten could succeed.

In a recent publication on this subject the writer, who lays down some excellent rules, says, among other things, "That any man may attempt to break a dog with a certainty of success, provided he will keep ever in mind the watchwords of this science: observation, patience, and perseverance." That is just what is the matter; but few men have those desirable qualifications.

THE KENNEL REGISTER.

List of dogs entered in the Kenael Register for the week ending Tuesday, April 4th:—

SETTERS.

Mr. Dwight Frances' March; Mr. L. C. Bruce's Flash; Mr. G. Bird Grinnell's Rock, Jr.; Mr. Alexander Pope, Jr.'s Jule; Dr. F. B. Greenough's Mag and Ned; Mr. Isaac Fiske's Kent and Mollie; Mr. John Nesbett's Bohle, Zolpha, Lina, Boz, and Rob Roy.

POINTERS.

Mr. Max Lemaire's Jack.

THE SPRINGFIELD BENCH SHOW.—A lack of space compels us to omit this week an abstract of the premium list which we had designed printing. We have, however, a quantity of the lists in pamphlet form which will be forwarded to the address of any of our readers on application.

—In addition to the special dog prizes offered for Centennial Dog Show, to be held on September 1st. The following have been offered since our last issue:—

Frank Roan, Esq., West Philadelphia—Silver collar for best Dachshaund dog of any age.

John Krider, Esq., Philadelphia—Silver mounted field whip for the best American-bred setter of any age.

Capt. A. H. Clay, Philadelphia—Solid silver dog whistle for the second best American-bred setter.

A LARGE LITTER.—Mr. F. A. Palmer's setter bitch Dove dropped a litter of 21 pups to Mr. Colburn's Sancho, son of Mr. Formau Taylor's one-eyed Sancho. This we believe is the largest litter on record. The same bitch, last August dropped 18 pups to Mr. Taylor's Sancho.

—John H. Develin, Esq., of this city, claims the name of "Moya" and "Mollie" for a brace of pure red Irish setter bitches, fifteen months old, imported from the kennel of Albert J. Meldon, Esq., of Duhlin, Ireland. Moya visited Plunket on the 22d ult.

—The many friends of our clever little sporting companion Charley Baneroff, congratulate him on the safe arrival from the Emeral Isle of his long looked-for pair of pure Irish pups. They are perfect beauties according to my poor judgment, and in time, with Charley's management will, I am sure, make their mark. They are decidedly the best addition I have seen for years to our Maryland dog stock. Hoping he may have the best of luck with them is the honest wish of many friends. J. T.

—The next great English Bench Show to be held at the Crystal Palace will commence on June 3d next.

SETTERS AS RETRIEVERS.

EDITOR FOREST AND STREAM:—

Your remarks upon my letter on this subject are to my mind perfectly conclusive as regards shooting in the States. I have had no experience in shooting in any part of America, except in the extreme North and South, in both of which places I saw at once, that except for duck, a retriever was unnecessary, as a retrieving setter could do all the fetching that was wanted, but I was not aware that the shooting was of the same nature throughout the States, and thought that on the prairies at least it would be advantageous to use a brace of setters and a retriever, as is constantly done in Scotland and some other countries.

Where one dog is only required at a time, it is of course desirable that he should retrieve, and I am not one of those who think that doing so is any injury to the nose. But I do think that it spoils, or at any rate, alters the style that some of our best bred dogs naturally have. To explain my meaning, we will suppose that A and B are two young setters sent to me on trial, I take them out to rough, open ground, free from wood, A jumps on a wall, and immediately comes to a set. B does the same, both their heads being in this case on a level. We move on, and put up a covey of partridges at a considerable distance. I see that both dogs have good noses, but I must know more of them, so on we go. I notice that A carries his head very high, while B carries his particularly low. (Suggestive of hunting mice). A comes to a point again, but B does not see him, and gets much too close to the game before he minds it, owing to his bad style. I have now seen enough, A is the dog for me. At present he is only fit for open work, but when he has been hunted in coverl, and taught to retrieve, he will come down in his style a bit, and make a first class dog. If I did not want him for covert shooting, or retrieving, I should prefer his business to his natural style, and he would get the credit of having a tip top nose. As for B, I consider him a potlering beast, but if I could not get a thoroughbred retriever, and wanted one, I would take him in preference to A. I fancy some of the imported dogs are something like A, and not, at first, of much use for general shooting.

I once took a gentleman (the owner of several prize dogs) out shooting with me, over some very rough ground in Wales; my only dog being a small, but very active setter bitch. He watched her for some time and at last exclaimed "Why none of my dogs can work like that, they would be useless here." I had previously shot with him on open ground, and been delighted with the style of one of his setters in particular, who had taken a first, or second prize at the Shrewsbury Trial Stakes. (I forget which). My little bitch could do anything, including finding wounded game, but she had not so pretty a style as his dog.

If not trespassing too much on your valuable space, the following extract from the letter of a friend of mine, who has been shooting this season in Yorkshire, England, may interest some of your readers: "The morning your letter came here, I went out shooting, and we had seven squwals at work, and no other dogs, and they worked splendidly. They are rather long backed, very strong, and not very long eared, white with yellow spots, very good to see in cover, splendid noses, and never make a sound. You see them work out every inch of ground, sending the game out, but not running it, and some of them retrieve it when required. They are quite strong enough in retrieve ducks and hares. They are good water dogs, and very handsome." His minute description of these spaniels is due to my having written to him for information on the subject. IBEX.

PITTSBURG, March 28th, 1876.

EDITOR FOREST AND STREAM:—

In the last issue, Vol. 6, No. 7, of your interesting paper, there is a letter from "Ibex," in which he advocates the use of a dog whose only duty is to retrieve when shooting over setters and pointers. I agree so completely with Ibex, that I was quite disapointed to read your comments upon his letter. You state that you "donht if he ever shot over a setter or pointer which was properly broken to that accomplishment," and also, that you "have never met a single individual who has pursued the course recommended by Ibex." Now Mr. Editor, I also may never have had the pleasure of shooting over a setter or pointer which was properly broken to the accomplishment of retrieving, but I wish in support of the argument advanced by Ibex, to give you an instance when his course has been pursued with gratifying success.

I have a friend in Missouri, whose custom it is to shoot quail, not only over two setters with a special retriever, but frequently with two setters and a pointer, with the same retriever. I have hunted with this friend when he had the four dogs under, as it appeared to me, perfect control, the retriever close at our heels, and the two setters and pointer ranging in obedience to the motions of his hand. The setters and pointer backed each other admirably and when a bird was killed, dropped to down charge, and remained in that position until the bird was retrieved, our guns reloaded, and they were told to hie on.

I call to mind one memorable day, about four years ago, when this friend and I bagged with muzzle-loaders, eighty-two quail by pursuing this course, and when our days sport was over he called my attention to the fact that during the whole day we had not seen a single bird upon the ground, either alive or dead.

Mr. Editor, I am interested in this matter solely from my love of the sport, and perhaps I am unduly influenced by the pleasure and rejuvenescence afforded me in these periodical hunts with my Missouri friend. I expect you to make due allowance for me, and am encouraged to write by the fact that your paper is open to the expression of individual opinions from gentlemen sportsmen. My profession not only keeps me from keeping dogs of my own, but deprives me of many pleasant shooting excursions.

My thoughts revert so strongly to my happy experiences with quail, grouse, and water fowl, in Missouri, that I cannot close this letter without a puff to the friend who has so often been my companion in these pleasures. He lives upon a snug little farm, situated in the midst of an excellent quail region, adjacent to the Mississippi bottom, where ducks and snipe resort in spring and autumn, and not far distant from the rolling prairies abounding with pinnated grouse. He is a thorough sportsman. If he has a guest, he invariably gives that guest the first shot, and never, under any circumstances does he himself shoot the wrong bird. He swears by the memory of Frank Forester, whose books he appears to know by heart. Frank Forester himself was not a truer sportsman, a better shot, or a warmer friend than he; and now as I sit at my desk in this smoky city of Pittsburgh, I feel an inexpressible longing for a weeks camping out with him upon the Mississippi bottom.

Mr. Editor, if you ever go to Missouri to shoot quail, and will let me know of it, I hope to show you a man who uses a special retriever with marked success. SKAG.

THE POINTS OF A SETTER.

POMFRET CENTRE, Conn., March 30th, 1876.

EDITOR FOREST AND STREAM:—

Anything that pertains to the improvement of my favorite dog, the setter, I take a deep interest in, and as the Rod and Gun Club of Springfield are soon to hold another grand Bench Show of Dogs, it might not be amiss that those who intend to exhibit for prizes should know what is generally conceded the most approved form of a setter of the present time, combining endurance, beauty, strength, and general usefulness. For myself, I have my own personal views in the matter, that an experience of more than forty years' field practice has led me into, and however bigoted I may be in my own opinion, I would not pretend to advance it as the most correct or popular one.

Now, will some brother sportsman kindly give us the general outlines of the most approved form of the setter of the present time? It might serve, in a great measure, as a correct guide in the selection of setters to show at the coming exhibition, more especially to those who have large kennels to select from. I would much like to hear from Esquire Smith on the subject. There seems to be plenty of discussion in all the sporting papers in regard to color of different breeds, and we see at all the bench shows the number of points each dog is marked; yet I think very few of the practical sportsmen fully understand the form on which these points were awarded.

It seems to me that exhibitors are entitled to know, before making their entries, the scale of points on which their dogs are to be judged. Is the short-legged, long-bodied setter, with long, turn-up tail, preferable to one with long legs and short body, with short, straight tail? Should the tail be carried high, or low? Should the chest be deep, rather round, and the loins broad, and flank deep, or the reverse? Should the feet be round and well feathered between the toes, or pointed and less feathered? Should the shoulder or rump be the highest? Should the neck be long and nearly of the same size at each extreme, or short and tapering? Should the ears be long, with rounded points, or shorter and more pointed? Should they be rather smooth at the extremity, or fringed heavily? Is a thick ear better than a thin one? Should the head be narrow, or broad at the top? Should it be narrow from top to eyes, or hold full width? Is a large, full eye considered better than a small one? Should the nose be thick, rather than thin, from the eyes downward? Should the tips be pendalant, or only moderately so? The coat fine and silky, or coarse, and should it be straight, or curly? Long, or short? Should one with the fringe below the gamhril joint be prefered to one without? How many points should a native setter receive for color, all else being equal? What would be considered the best color for field service? How many generations must one have been bred in America before it is entitled to be called a native? In reality all came originally from foreign stock. Is an extra large one preferable to a medium-sized, or small one? How many points are awarded for merely size? Should two dogs be equal in all points save pedigree, how many points are lost for lack of podigree? Does a dog lose any points by having his tail shortened to avoid a crook in it?

As the foregoing inquiries combine the most mooted points in question, a reply from some one better posted than myself would be very gratifying to me, and of much practical value to the sporting public generally. ETHAN ALLIN.

COURSING.

NEW YORK, March 18, 1876.

EDITOR FOREST AND STREAM:—

I was much interested to your article on "Coursing," and hope you may be the means of making that most delightful sport better known. The last time I followed the greyhounds was some twenty-five years ago, in Yorkshire, England, while on a visit there, going out in the early morning with my host, and a couple of well bred dogs; one famous in that part of the country for his speed, and the other a small, but remarkably clever slut. After killing a couple of hares without anything of special nota, the horses almost kicked a third out of her form. We had a sharp run, and "Puss," hard pressed, made for a gate leading to a ploughed field. The dog went over with one of those magnificent bounds so beautiful in the greyhound, while the slut, in passing under the lowest bar, caught and killed the hare in the act of doubling back. It was the prettiest kill I ever saw.

I think the greyhound of California, you write about, as killing wild cats and California lions, cannot possibly be the smooth haired English greyhound. Are they not the rough haired Scotch deerhound, than which there is no more handsome, intelligent, and fearless dog in the world? FLAMBORO.

[The greyhounds we alluded to were the smooth-coated English dogs, or dogs bred from English stock. Possibly the fact of their having been in that wild country and accustomed from puppyhood to course coyotes, or prairie wolves, and such vermin, increased their courage. A splendid dog for that country would be the Australian kangaroo hound, or a cross between the greyhound and the Scotch staghound.—ED.]

CLUMBER SPANIELS.

EDITOR FOREST AND STREAM:— KENTVILLE, N. S., March 20th, 1876.

My clumber bitch, "Bess," visited my well-known "Bustler" on the 20th March. This strain is well known in Nova Scotia, where it is justly considered *la creme de la creme*.

I should be glad to answer any inquiries as to pedigree, etc., by giving an account of my kennel. I may say *en passant* that "Bess," now ten months old, bred as above, astonished the natives by taking to hunting at four months old, and was as good as could be at four months and two weeks—before she had shed her first teeth! She now weighs forty-five pounds. Bess, while working her six days a week, weighs thirty-six, and Bustler forty-eight pounds. They are nearly white with pale lemon evenly divided and ticked, long, broad, and level with short, straight legs, heavily feathered, good (cherry) noses, good tempered, and never tired. B. S.

Game Bag and Gun.

GAME IN SEASON IN APRIL.

Wild duck, geese, brant, &c.

GAME IN MARKET.—Ducks continue plentiful, and indeed rather slow of sale, canvas backs bringing only $2 per pair; black ducks, widgeon, broad bills, etc., are worth from 60 cents to 75 cents per pair; geese, $1.25 each; wild pigeons are more abundant, and bring $1.50 per dozen.

—An Indian river (Florida) correspondent says that hunting has been poor this winter, probably on account of the long-continued drought, which has driven deer, bears, etc., down south towards the everglades, where they can get water.

A NOVEL GUN.—It is rarely that we see anything in the shape of a combination gun which comes up to the mark in utility, but the combined shot gun and rifle made by Messrs. Allerton & Baker, of Lisle, Broome County, this State, really seems to fill the bill. The gun is a breech loader, and one action opens all three barrels, the rifle, which takes a .44 calibre metalic cartridge, occupying no more room than the ramrod of a muzzle-loader. We consider it a good thing, and can safely recommend it to those who may be looking for such a weapon.

ADIRONDACKS—*Windsor, March 27th.*—In a letter from Fenton, of No. 4, Lewis county, N. Y., he says:—"Mark Smith killed a large panther last week, about one mile west of the house. Weather very cold the past ten days, and the thermometer has fallen below zero several times; snow fell about a foot deep. Smith lives at No. 4 with his father, Chauncey, known to all the boys who visit this section of the wilderness. F. BOLLES, JR.

LONG ISLAND—*Good Ground, March 30th.*—Having paid a visit to Pon Quogue for the purpose of shooting, I was not disappointed. Having visited all the shooting places on the island with not much success, I thought I would try the above place. I saw more birds, and had the best shooting I ever had. I am told that on account of the inlet being shut up last year, although running now, these waters became brackish, and by that an abundance of feed was provided for the ducks. As high as 110 broadbills was shot by one man in a day; another killed 85; and they averaged from 20 to 40 per day. It was thought the shooting would last until the middle of May on account of so much feed. SPORTSMAN.

ILLINOIS, April 4th.—Snipe, geese, ducks, brant, etc., are reported abundant in Illinois, and the lakes and streams free of ice.

PIGEON MATCHES.

—Ira A. Paine and Mr. Gildersleeve shot two matches at Dexter Park, on Wednesday of last week, the stakes being $200, the conditions, each to shoot at thirty birds in each match, the first to be at 21 yards rise and the second at 25 yards, Mr. Gildersleeve to have the use of both barrels, while Paine was only allowed one. The result was as follows:—

First Match.—Paine—1 1 1 0 1 1 0 1 0 1 0 1 1 1 0 1 1 1 1 1 1 1 1 0 1 1 1 1 1 0 1—Total killed, 23.
Gildersleeve—0 0 1 1 1 1 0 1 0 0 0 1 1 1 0 1 1 1 1 1 1 0 1 1 1 1 1 1 1 0 1 1 1—Total killed, 24.

Second Match.—Paine—1 1 1 1 0 1 1 0 0 1 0 0 1 1 0 1 0 1 0 1 1 1 1 1 0 1 1 1 1 0 1 1 0—Total killed, 29.
Gildersleeve—1 1 1* 1 1 1 0 0 0 0 1 1 1 1 0 1 0 1* 1* 0 1 1 1 1 1 1 1 0 0 0—Total killed, 20.
*Killed with second barrel.

In shooting off the draw, to decide, Mr. Gildersleeve killed three birds to Paine's two, and won.

SYRACUSE.—The Onondaga County Sportsmen's Club had a practice shoot on Wednesday, March 29th. The following was the score. Twenty-one yards, five birds:—J. Bedford, 5; R. B. Stroug, 4; E. Lodder, 4; W. Fage, 4; T. Brazell, 4; C. Earle, 3; F. Denison, 3; T. Kimber, 2. H. Ayling, 1; J. Fage, 2. J. Bedford took first money. Messrs. Brazell, Lodder, W. Fage, and Stroug then shot off the ties of 4, and Mr. Fage took second money by shooting two out of three. Messrs. Denison and Earle divided the third money. SENECA.

—Capt. A. H. Bogardus, champion wing shot of the world, gave an exhibition of his skill on the 7th ult., at Beacon Park, by killing 30 out of 31 birds, after which he

illed 26 birds in two minutes and 53 seconds. The first ot were double birds, traps forty yards apart, the shooter anding midway between the traps, as is his custom. A umber of sweepstakes preceded the exhibition matches.

—A match at snow birds was shot at Erie, Penn., on the 8th ult., usual conditions, 1¼ ounces shot, with the follow- g result:—

Name.	Score.	Name.	Score.
W. Duffy	11	P. Galbraith	7
Graham	10	J. E. Graham	7

A new sportsmen's club has been started at Erie.

AN INTERNATIONAL PIGEON MATCH.—We learn from an xchange that arrangements have been perfected at Read- g, Penn., for a grand international pigeon shooting match, en to all pigeon shooters in America and Europe. The ournament will last three days. On the first day the con- st will be for the championship of the world at double rd shooting. On the second day will be decided the sin- e bird match for the championship of the world. On he third day there will be a match at fifty birds, open to l, and several sweepstakes. In the double bird match he contestants will be allowed to shoot at twenty-five ouble birds each. In the single bird match the number f birds that each competitor will shoot at will be one hun- ed, Hurlingham rules. The prizes will be a champion amond medal and two money prizes.

St. Louis, March 25th, 1876.

DITOR FOREST AND STREAM:—

The miserable weather which has prevented the "long william" gentle- an, who annually visits us, about this time, answering to their oft re- eated names, has made the "boys" quite desperate, and their madness liminated to-day. The rumblings of the coming storm, had been nown, and heeded, by the "gamins" of our streets, who responded erally, and the result was, about 500 innocent pigeons, ready for the ughter.

The first event was a match between Mr. C. Jeff. Clark and Mr. W. Wadsworth, for $25 a side; 10 single birds at 21 yards rise, and 5 rs at 26 yards rise. It was won by Mr. Clark, by a very handsome ore. (I have mislaid the score, therefore am unable to give it in detail). ter this shoot, commenced the regular work of the day, the medal oot. Considering the weather, rain, wind, and cold, the shooting was y good. The terms of the match were same as usual at all of our b matches: 10 single birds, 21 yards rise, 80 yards boundary, "H and " traps. The following is the score.—

Name.	Total.	Name.	Total.
C. Pierce	10	Jos. Lucas	8
ther Kennett	10	Hunt. P. Wilson	8
pt. J. Sedam	10	W. A. Albright	7
H. Wadsworth	9	Jno. W. Munson	7
B. C. Lucas	9	C. S. Chouteau	6
o. Rinkle	9	Chas. H. Turner	5
o. A. Ringold	9	Frank West	5
o. M. Vimont	9	W. L. Scott	5
s. P. Card	9	Eugene Capelle	4
C. Christie	8	C. Jeff. Clark	4
as. M. Williams	8	W. Wiegans	3

Ties on ten birds at 26 yards rise: H. C. Pierce, 4; Capt. J. Sedam, Luther Kennett, 2. Ties on 4 at 31 yards rise: H. C. Pierce, 2; Capt. Sedam, 0. The result gave the champion medal to Mr. Pierce.

After the regular shoot was pleasantly disposed of, there yet remained supply of birds on hand, and as it is against the principles of each in- vidual of the club, to leave the field, so long as there is a bird left able fly, of course a sweepstake shoot was introduced. In order to permit e gentlemen present to test their "choke-bores" at long range, the dis- ce was made 31 yards and 5 birds, $2 entrance, 80 yards boundry—the ails: The score is not brilliant, but considering that many contesting d not shot before at that distance, it is fair. In this connection we ould suggest, to persons desiring to become proficient at pigeon shoot- g, if they would discard the 21 yard rise for 31 yards, their progress ould be much more rapid, and their judgment, as to angles and dis- nce, so material in wing shooting, would become much more perfect en they can ever attain while shooting at shorter range. The follow- g shows the result of the sweepstake, 31 yards rise:—

Name.	Total.	Name.	Total.
S. Chouteau	4	Chas. H. Turner	3
as. M. Williams	4	Eugene Capelle	3
ank West	4	Capt. J. Sedam	3

The St. Louis Gun Club and the Quincy Club, hold their first shoot of home and home" match, at Quincy, Ill., about 15th of April.

St. Louis.

FLANNEL SHOT CARTRIDGES.

BALTIMORE, Md., March 31st, 1876.

ITOR FOREST AND STREAM:—

Having noticed the idea in "our paper" of flannel bags for shot car- iges, will say for the benefit of "Hall" (in this week's issue, March h,) that I made a very limited experiment with them last week while oting ducks.

as I only made a few of the bags to put into the shells, and not hav- tried them at a target, cannot say how they distribute the shot, but inclined to think they are very irregular, as one duck I killed with m—a hen red-head—although more than eighty yards from the muz- of the gun, which, by the way, is a relief bore, 10-gauge Greener, 9¼ nds, had a hole through the breast large enough to insert a man's ger into. The flannel I used was a piece of navy blue coating, and de the bags by running up the sides and one end upon a sewing ma- ne, and after inserting the shot, tying the open end with thread. I sh that some of our (if you will permit the expression) correspondents o have time and opportunity, would try these at a target and give us results; for if they are regular in the distribution of their loads y must certainly be very useful, as they will kill from fifteen to enty yards further than loose shot.

Hoping that, as two of your correspondents have already called atten- n to them, others will feel interested enough to give them a fair trial, which all the merits and demerits will be brought up and discussed.

A POOR SHOT.

A TRIP TO BIG LAKE,

ITOR FOREST AND STREAM:—

ebruary 20th, myself and three others left St. Louis over the Iron ountain Railroad for a few days sport. We arrived at Williamsville, ., 145 miles from St Louis at seven-thirty in the evening. The pio- neer guide and bear hunter Joe Deine, met us at the depot with a nice little span of bays and a spring wagon, and everything in readiness for a few day's sport. We drove twenty seven miles by half past twelve, and pitched our tent on the hill one and a half miles from the lake and then retired for the night. But being so close to the enemy we could not sleep much; we were up at half past four and had everything in readiness to move by daybreak. We arrived at the long looked for lake by the time it was getting light. We could hear the firing of the guns of some other sportsmen before we arrived. We concluded we would prospect a little before we settled down for the fight, and after making a few shots our guide advised us to move down the lake, and take our stand on the points where the ducks were in the habit of crossing over, and not to run around but to keep our stands. He assured us if we would take his advice we would be sure to have fine shooting, and our success would be certain. We did so and I am convinced he knew what he was talking about. I was standing on a divide between two lakes with my friend Dave Jones, he being about seventy yards from me; the wind had sprung up and it was blowing quite lively, but it proved to be an advantage in our favor as the ducks kept on the lakes, but would fly from one to the other. They would fly very low, just above the weeds and grass, and would occasionally start off for the field, but the wind being so strong they returned again to the lake. About two in the afternoon the clouds began to loom up as if it was going to storm. Then the fun commenced; the ducks began to fly, we could not load half fast enough. Such shooting and excitement I never saw; three of us shooting just as fast as we could load. We often got two and three ducks a piece from a flock. We kept this up until near night, having killed eighty-nine ducks, one brant, eight geese, and one crane. We thought this fun enough for one day, so we hitched up our team and started for camp.

B.

GEORGIA NOTES.

EUBANKS P. O., March 9, 1876.

EDITOR FOREST AND STREAM:—

I like "Aliquis'" experience in fox-hunting, as he describes it, but must acknowledge I can't see the necessity of so much "horn-blowing," that is totally different from any fox-hunt that it was ever my fortune to be in. With us, we use a cow's horn, some handed down as heirlooms for generations on account of the mellowness of their sound; of course some have them handsomely mounted, but like everything belonging to the chase, they are held at fictitious prices, and many can not be bought, although a hundred perhaps as good are ornamenting the heads of our cattle. Our horns only sound to collect our dogs, before we "strike a trail," and at the death for the stragglers. Many fox-hunters never "halloa" to their hounds, as it runs the fox off; the human voice terrifying them more than even the eye of the pack. The fox's usual course being a circle, and we riding the diameter until his "doubles" shows his weariness. The fox (red) is no "slouch" himself if not too exhausted: nearly all my hounds bear their marks on their noses. A neighbor plowing, saw a red bitch of mine (pack having split after two foxes) catch a fox, who whipped her off and both lay down; every time the fox would get up she would go for him, and on the sixth trial she caught the fox under the stomach and killed it just as he got to her. The bitch will not weigh over eighteen pounds, but she had the grit in her, although fagged out by her long chase. I would have given a $10 note to have seen it, even if cotton has gone to ten and a half and bacon fifteen cents.

We have had less game this season than I have ever known. I don't think it is too much shot gun, but too little grain—all of we Southerners still preferring to keep our "corn cribs" and "smoke houses" out West. Our streams are nearly devoid of game fish, which I think is caused from cultivating our red clay lands to the waters edge, and every rain carries its tons of the soil into our creeks, and I don't believe that Col. Seth Green with his corps of fish commissioners can ever do us any good.

I noticed one of your correspondents in speaking of "gator shooting," says they will sink. I had some sport on Cumberland Island last fall, and all that sank I thought I missed; several that I killed were floating with their yellow bellies upward, and the gentleman with whom I was, told me that they would always float when killed. It is rather singular that some of your correspondents don't write of that island. "Georgia" I know can, after he gets through his fight about "Irish setters." Cumberland has been a favorite resort for years for hunting parties from Savannah and Macon.

JAREL.

—The New England Amateur Base Ball Association—a misnomer, by the way, as regular professional clubs belong to it—held its annual meeting March 21st, at Boston, when the following clubs were represented by delegates:—Suffolk, of Boston; Fall River, of Fall River; Taunton, of Taunton; Lowell, of Lowell; Live Oaks, of Lynn; Rhode Island, of Providence, and the New Haven Club, of New Haven, Conn. Nearly all these clubs run on a professional basis. The season for the contesting of the championship of the New England States, as established by the convention, is from May 1st to November 1st of each year. The following officers were elected:—President, J. G. Peck, Rhode Island Club; Vice President, William Roich, Fall River Club; Secretary, J. H. Marqueze, Suffolk; Treasurer, R. W. Townsend, Taunton.

—The Enterprise Base Ball Club of New York organized on March 28th, 1876, and the following officers were elected:—C. Kundahl, President; S. E. Mott, Vice-President; Morris Meyer, Secretary; Max Meyer, Treasurer; G. Stack, Captain. The nine for this year will be G. Stack, 2d b.; P. Hicky, 1st b.; B. D. Fowler, 3d b.; B. R. Moore, s. s.; E. Werner, c.; C. Baier, p.; Kundahl, l. f.; C. Werner, c. f.; W. O'Connor, r. f. Communications to be sent to M. Meyer, 15 Centre street, New York.

—A base ball convention is to be held in Syracuse, N. Y., on April 10th. At this meeting a championship emblem for competition among clubs within the jurisdiction of the association will be decided upon, at which time a code of rules governing the contest will also be adopted.

—Carrying out their peculiar plan of operations for 1876, the St. Louis Club have appointed Mr. Geary Captain of their nine.

—Anson will not play ball this season. He is going to open a hand ball and racket court in Philadelphia in May.

—The first regular match game played by a professional club this season was that which took place in New Haven, March 29th, the score of which was as follows:—

New Haven	3	0	1	0	0	1	0	0	3—8
Star	0	0	0	0	0	0	0	1	0—1

Umpire—Mr. AYERS, of the New Haven Gray Club; Time of game—two hours and five minutes; first base by errors—New Haven, 3; Stars, 3; runs earned—New Haven, 3; Stars, 4.

—The chess tournament in progress at the Café International in this city increases in interest every week. The record up to April 3d, is as follows:—

Players	Games won.	Games lost.	Games drawn.
Alberoni	5	0	2
Ensor	5	0	0
Mackenzie	4	0	0
Richardson	4	1	0
Roser	4	2	0
Becker	3	1	2
Bird	2	1	0
Brenninger	1	1	0
Mason	1	1	2
Delmar	1	0	1

THE ENGLISH UNIVERSITY BOAT RACE.—On Saturday this great rowing event will be decided on the river Thames or "Tems," as the Cockneys call it, between Mortlake and Putney. We recently published the names and weights of the sixteen contestants—sixteen if we omit the coxswains, who, however, can be largely instrumental in compassing either defeat or victory. Since then there has been no variation in the formation of the crews unless it is in the weights. It is rather a remarkable fact that there is but a pound and a half difference in the total weight of the crews; this slight disparity, apparently in favor of Oxford, being counterbalanced by the fact, that her coxswain weighs six pounds more than the Cambridge "boat-steerer," and that she consequently has this additional amount of dead-weight to carry. As the tide suits early in the forenoon, the race will probably be rowed at an early hour, and allowing for the difference in time by which the electric current is able to beat the sun, we should have the news of the result by nine or ten o'clock on Saturday morning. The latest betting intelligence received by cable showed, that the Cambridge crew were favorites at odds of 5 to 4. *Bell's Life*, the great authority in such matters said, in last Saturday's issue, that "if the 'Cantabs' can stay, they should win, if style is any criterion of merit."

—Boating men will be pained to learn of the accident which is reported to have occurred to Mr. Eldred of the Argonanta crew now sojourning in Florida. It is said that his gun was accidentally discharged, blowing away the second finger and thumb of his left hand. This unfortunate accident will not only put Mr. Eldred *hors du combat* as far as rowing is concerned, but deprives the Argonauta Association of their stroke and best bower. Being without details we are at a loss to understand how such an accident could have occurred. Every shooting man has a breech-loader nowadays, and almost the chief merit of the new gun is its greater safety. Accidents of late years have not only been far less in numbers, but have been caused in most cases by the carelessness of some one beside the party injured, and it seems almost incredible that a man should blow his own fingers off, except by the bursting of his gun.

Since the above was in type the crew have arrived from Florida, and we have heard more particulars regarding Mr. Eldred's lamentable accident. It appears that in company with two of his companions he had just started on a shooting trip. Eldred was rowing the boat, and as they were about landing, one of the party, standing in the stern, shot a duck. At the same time the boat touched bottom, and the shock threw the shooter off his balance, and in saving himself he dropped the gun; the remaining barrel was by some means discharged within a few inches of Mr. Eldred's hand. The whole load, after taking off part of his second finger, passed through the handle of the oar leaving a hole as clean as though cut with an augur, cut off part of his thumb, and struck the large buckle of the belt he had around his waist, bending it into a shapeless mass. Notwithstanding this protection a number of shot entered his abdomen, but fortunately without inflicting any serious wound. They were twelve miles from camp, and upon reaching there Mr. Eldred was obliged to ride thirty miles on horseback before a doctor could be found to dress his wounds.

—*Bell's Life*, referring to the International regatta to take place at Philadelphia, remarks: "We have no knowledge of any English racing yacht likely to participate in the International Regatta at Philadelphia from June 22 to June 26. Several cruising crafts, we believe, are going across to the Centennial. The schooner Helen, of 283 tons, has already left Cowes, for Philadelphia."

—The following good story is told of Rev. Dr. John Todd, whom every one knows was an excellent angler and hunter. A friend sent him a wherry, and this story is told of his misadventure in attempting to navigate the little craft:

"One Summer afternoon he ordered his man to bring up the wagon and take him and the little boat down to a retired spot on the river and leave him there. An hour or two later there came up a heavy shower, and in the midst of the pouring rain Doctor Todd appeared, drenched to the skin. He was immediately taken in hand and carefully tended, and after the shower was over the wagon was sent for the boat; and no one would ever have attributed the waiting to anything but the shower had not an old farmer, wandering along the riparian boundary of his land, arrived at the spot just in time to see him crawl up from the bottom of the river. But no such misadventure with one of his hobbies ever checked his enthusism about another, or, indeed, more than temporarily cooled his ardor about the very one that threw him. And, though he kept his failure to himself as much as possible, yet when found out he would join in the laugh at himself with the most amiable and hearty good-nature."

—Darwin says: "Man is the only being of the animal creation that abuses the female of his race."

THE NEW

BOSTON

SHOOTING SUIT,

Manufactured only by

G. W. SIMMONS & SON,

Boston, Mass.

We offer this season an entirely new design of WATER-PROOF SHOOTING SUIT (made from extra quality duck), in the preparation of which we have been assisted by the advice and suggestions of our best resident sportsmen.

The design embraces the best points of the English and French Suits, combined with the necessary requirements for American service. Particular attention has been paid to color.

Each suit is thoroughly water-proofed by a new patent process. The seams and pocket corners being securely fastened, the arm holes ventilated, and nothing neglected to render the suit perfect in every respect.

The price has been fixed at $13, to include Hat or Double Visored Cap, Detachable Haverlock, Coat, Vest, and Pantaloons.

One hundred suits will be kept ready in stock, so that we can furnish to order any size required, at a moment's notice.

In the *Golden Rule* (Rev. W. H. H. Murray's paper) the enthusiastic editor writes:—

"We were shown, the other day, a new water-proof suit, specially adapted for sportsmen, designed and made up by Simmons & Son, of Boston, and to which we call the attention of all brethren of the out-door and shore-shooting fraternity, because it meets the demand of personal comfort and convenience beyond anything of home manufacture seen by us before. As a sportsman, we give it our unqualified endorsement, as combining the best points of the English suits, and in addition skilfully adapted to the necessities of the American service. It is a most admirable and satisfactory contrivance in color, style, water-proof quality and capacity. The cost is a marvel in this latter respect."

Persons ordering from a distance need send only the following to be sure of a perfect fit:—Waist Measure, Height, Breast Measure, Length of Sleeve, Size of Head.

THE SPORTSMEN'S ROUTE.

Chicago & Northwestern Railway.

This great corporation now owns and operates over two thousand miles of road, radiating from Chicago. Like the fingers in a man's hand, its lines reach in all directions, and cover about all the country north, northwest, and west of Chicago. With one branch it reaches Racine, Kenosha, Milwaukee, and the country north thereof; with another line it pushes through Janesville, Watertown, Oshkosh, Fond du Lac, Green Bay, Escanaba, to Naganaec and Marquette; with another line it passes through Madison, Elroy, and for St. Paul and Minneapolis; branching westward from Elroy, it runs to and through Winona, Owatonna, St. Peter, Mankato, New Ulm, and stops not until Lake Kameska, Dakota, is reached; another line starts from Chicago and runs through Elgin and Rockford to Freeport, and, *via* the Illinois Central, reaches Warren, Galina and Dubuque, and the country beyond. Still another line runs almost due westward, and passes through Dixon, Sterling, Fulton, Clinton (Iowa), Cedar Rapids, Marshalltown, Grand Junction, to Council Bluffs and Omaha. This last named is the "GREAT TRANS-CONTINENTAL ROUTE," and the pioneer overland line for Nebraska, Colorado, Utah, Idaho, Montana, Nevada, California, and the Pacific Coast. It runs through the Garden of Illinois and Iowa, and is the safest, shortest, and best route to Omaha, Lincoln, and other points in Nebraska, and for Cheyenne, Denver, Salt Lake City, Virginia City, Carson, Sacramento, San Francisco, and all other points west of the Missouri River.

TO SPORTSMEN:

THIS LINE PRESENTS PECULIAR ADVANTAGES—FOR PRAIRIE CHICKEN, DUCK, GEESE, AND BRANT SHOOTING, THE IOWA LINE TO-DAY OFFERS MORE FAVORABLE POINTS

than any other road in the country, while for Deer and Bear Hunting, and for Brook Trout, Lake Salmon, Pike, Pickerel, and Bass Fishing a hundred points on the Northern and Northwestern lines of this company will be found unsurpassed by any in the West.

MARVIN HUGHITT, Gen. Supt., Chicago. W. H. STENNETT, Gen. Pass. Agt., Chicago.

FOR SALE, OR TO LET.

The elegant country residence, WILLOW LAKE, at Locust Valley, near Glen Cove, Long Island.

Suitable for Summer Boarding-House.

The house is 2½ stories, frame, 40 feet front and 32 feet deep, with wide piazza front, rear, and on south end. On first floor are parlors, sitting-room, and dining-room; wide hall through the centre. Up stairs are 9 bed-rooms, all large and airy; kitchen well-arranged and convenient; cellar large and dry.

On the premises, and at a convenient distance from the house, are a stable and carriage house, chicken-house, shed, coal, tool, and ice houses. The grounds are well laid out and tastefully planted with ornamental trees and shrubbery. The avenue leading from the road to the house skirts a beautiful lake, on the border of which the house stands. A Paper Mill at the north end of the lake will be sold with the above, subject to a lease. The lake and land embrace about 27 acres. As a place of residence it is elegant and healthy; for manufacturers it is convenient; for the propagation of trout, for pleasure or profit, there is no better place in the State. Apply to

BUY IT Vanity Fair.

It is shaved from the best Natural Leaf, for Meerschaum and Cigarettes. Does not make the tongue sore. Sample on receipt of 20 cents. Highest award, Vienna, 1873. Send for circular. WM. S. KIMBALL & CO.,
PEERLESS TOBACCO WORKS, Rochester, N. Y.

From Seth Green, Supt. N. Y. State Fisheries.

I find Vanity Fair to be the best article of tobacco adapted to the wants of the sportsman. Have used your tobaccos for many years, and know them all to be first-class.

For Sportsmen.

A trusty friend, in weariness or trouble; a solid resource in Winter and rough weather, is a sweet pipe with Vanity Frir. Best dealers have it.

From A. B. Lamberton, Rochester.

Having smoked your tobacco, Vanity Fair, by the camp fire and by the hearth, I believe it in point of fragrance and taste superior to all brands known to me. Being in search of a tobacco that would not fire the tongue and mouth, I was made acquainted with your Vanity Fair, and found it to be the *ne plus ultra* of natural leaf.

For Cigarettes.

A cigarette is an interlude to the serious habit; a graceful make-believe for spare hours. For cigarettes Vanity Fair has no equal. Best dealers have it.

From Forest and Stream, N Y.

We have received from Messrs. Kimball & Co., of Rochester, some choice specimens of their celebrated Vanity Fair tobacco in neat metal cases holding a pound each; and, after most thorough trial, do not hesitate to concede to it all the good qualities which its manufacturers claim for it. It is a most superior article, and a great comfort to discriminating smokers.

THE

PAPER STEM PIPE.

Just the Thing for Home and Camp Use.

Supplies a want which smokers have long felt—a pipe which shall give simply the taste and odor of tobacco smoke. This pipe never accumulates rank smelling liquid in stem or bowl, but is always clean and sweet. The bowl and mouthpiece are permanent, but the stem is of porous paper, to be laid aside after a few days' use and a new one fitted. Extra stems accompany each pipe. The price of extra stems, when not furnished with the pipe, is as follows: Four and a half and seven inches, 5c.; twelve inches, 15c. Sold by pipe and cigar dealers generally, or a complete sample sent by mail for $1 by

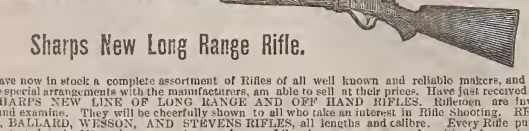
Paper and Metallic Shells
FOR
Breech Loading Shot Guns,
Manufactured by the
UNION METALLIC CARTRIDGE CO.,
BRIDGEPORT, CONN.

THE STURTEVANT SHELLS are the easiest reloaded. Do not have to unscrew the head nor use an awl to remove the exploded caps. THE PATENT MOVABLE ANVILS, made of steel wire, will not bend or break.

THE BERDAN PATENT SHELLS, new model, with Hobbs' patent waterproof primers, never miss fire, and are highly prized by all that have used them.

PAPER SHELLS.—By repeated experiments and great outlay for improved materials, and machinery made expressly for the purpose, we can now warrant our BROWN PAPER SHELLS equal to any imported. They are sure fire, and will not burst in the gun.

Inquire of any of the dealers in sporting materials for the U. M. C. Co.'s Shells.
Not sold at retail by the manufacturers. dec23 tf



Hart's Sportsman's Favorite Metallic Shells for Breech Loading Shot Guns.

These Shells are easily loaded, and the caps easily extracted from inside. Head solid, and much thicker than any shell now made, giving a solid seat for cone or anvil, which prevents it from driving through or springing away, thereby causing misfires. The cone is made of nickle and fastened solid in its place. It neither rusts or corrodes fast like moveable anvil made of steel. The nickle cone also prevents misfire when cap has been left on shell for a few days, which is liable to occur either in steel or iron. These shells are finely finished, and made any length ordered, from 2¼ to 3¼ inches.

Shells and Loaders, and description Price Lists, can be obtained from all the leading sportsmen's houses throughout the country. GEO. E. HART & CO., 363 and 365 Market st., Newark, N. J.

From Captain Bogardus, Champion Wing Shot of America.

Messrs. George E. Hart & Co.,
Gentlemen—The fifty shells I received from you to-day suit me better than any I have ever used. They are stronger and better in every respect, and I shall use them in all my shooting hereafter. Yours truly.
may13-1y A. H. Bogardus.

The Popular Sheridan Lounge, $5 plain; $10 quilted is the standard with sportsmen. Sold at Eaton & Co.'s, 102 Nassau st., and E. S. Harris, 177 Broadway.

CHAMPION GUNS OF ENGLAND
PAPE'S
Unrivalled Sporting Guns.

Stand unequalled in every contest. Their performance at the London Trials of 1875 beats the records of any maker in the world.

1875. 12-Gauge, Choke Boring.
Maker of Gun. Exhibitor.
1st—Greener.....Greener.
2d—Pape.....Davidson.
3d—Pape.....Pape.

Out of a class of 68 guns, 3 out of the 5 best were made by Pape. The Greener gun was protested against on the spot for having its score false counted, the fact proven there, and afterwards confirmed by same gun being shot for two days per week for six weeks in succession, when its average score only took 24th place, its very best score being greatly below the scores of the best six guns.

1875. 12-Gauge, Old Sporting Bore.
Maker of Gun. Exhibitor.
1st—Pape.....Davidson.
2d—Pape.....Davidson.
1875. Long Range, 60 yards, Choke Bore.
1st—Pape.....Davidson
60 yards, Long Range, Sporting Boring.
1st—Pape.....Davidson

Those champion Long Range guns, only 7 pound weight, with a charge of 3¼ dr. to 1¼ oz. shot, beat the best 8 bore Greener gun at 60 yards; weight, 15 lbs.; 6 drachms and 24 oz. shot.

1875. The Sportsman's Sub. Cup, valued at £45, was also awarded to W. R. Pape, for the original invention of choke boring. Winner of the London Gun Trials of 1858, 1859, 1866. Address
NORTH OF ENGLAND GUN WORKS,
Newcastle on Tyne, England
dec2 tf NO AGENTS.

H. C. Squires, No. 1, Courtlandt st. New York.

THE GREAT
London Gun Trial,
1875.

W. W. GREENER'S
Far-Killing Prize Guns.

Winner of Silver Cup, value 40 guineas. Winner in Class 1, for 8 and 10 bores. Winner in Class 4, for 20 bores. Winner in the Wear and Tear Trials, July, 1875. 2,500 shots fired without deterioration.

W. W. G. is the only maker who has made an average pattern of 214 shots in a 30-inch circle, at 40 yards, with a 12-bore gun, at any public trial either in England or America.

I have just received a consignment of these guns, and shall offer to individual sportsmen, for a short time, an opportunity to secure one of these celebrated guns at a popular price, viz: $75, gold; extra for extreme close shooting, $10. This will probably be the last chance to secure one of these guns at these very low figures. All grades and styles in stock or imported to order.

Attention is also called to my stock of guns, by W. & C. Scott & Sons, which includes all their latest improvements. No old style guns in stock.

Sole New York Agent for Holabird's Hunting and Fishing Suits. Trade supplied.

Send 25 cents for large Illustrated Catalogue of Guns and Fishing Game Laws for all the States, and summary of Great London Gun Trial. Ready March 1st. jan13 1y

Send for Circular.
Clark & Sneider.
214 W. Pratt st., Baltimore.

WILLIAMS & POWELL,
Gun and Rifle Manufacturers,
Call the attention of the Sportsmen of America to the extreme SIMPLICITY, STRENTH and DURABILITY of their New Patent "SIMPLEX" Breech loader and INDEPENDENT EXTRACTOR.

The parts in this new action are so few (only two,) its mechanical soundness so thorough, and the strength and simplicity of the action so great, that W. & P. feel sure it will supercede all the complicated and manifold grips now in use, its one powerful grip being far stronger than any double, treble or quadruple grip now used. In this new action LEVER and GRIP ARE ONE SOLID PIECE OF STEEL and the ANGLE of the BODY is left in its ENTIRE STRENGTH.

Drawings of action and extractor will be sent on application, and orders may be forwarded through any of the best houses in the States for execution in the Spring.

Guns guaranteed to make patterns of from 160 to 230 with No. 6 SHOT AT 40 YARDS, as desired.

NO. 25 SOUTH CASTLE STREET,
LIVERPOOL.

NOW READY.

THE ORVIS REEL.

NO 1.—This Reel is extra nickel-plated and finely finished. Is perforated to make it light, and keep it free from sand, also that the line may dry without removing it from the reel after use. Has a very perfect click. It is very light, very strong, and holds from 40 to 50 yards of line. It is more compact and less cumbersome than ordinary 20 yard reels. It is quite narrow, and takes up line rapidly. Put up in neat Black Walnut Case, price $8.

NO. 2—For Prizes. Same style as No. 1. Heavy Gold Plate. Extra finish, with case, price $10.

Sent by mail, postage prepaid, on receipt of price, or by express, C. O. D. LIBERAL DISCOUNT TO THE TRADE. Send for Price List of Fishing Rods and Reels Mention this paper.

CALIFORNIA.

[*A Poem, reprinted from the Brooklyn Eagle, with marginal notes and emendations, and Dedicated to "Emma Mine."*]

BY CHARLES HALLOCK.

THERE'S a land of rare fame,
California by name.
Which lies in a far distant region,
Where placers of *gold*, [*a*]
Of value untold,
Are "struck" in veins that are legion.

Where the turmoil and strife
Of everyday life
Are flecked with hues that are golden;
And the "goose" [*b*] hangeth high
In a halcyon sky,
By rainbows of promise upholden.

There padre and priest
Still thrive and exist
In unctuous primal condition;
And doze o'er their wine
'Neath the wide-spreading vine
That shades the old Spanish mission.

There every known joy,
Without much alloy,
Is bestowed on meanest of sinners—
Though the ways of the land
(As we all understand)
Are rough on verdant beginners.

For grizzlies, unkempt,
Quite frequent [*c*] pre-empt
The claims taken up by the miners;
And the "heathen Chinee," [*d*]
In ways strange to see,
Tries his luck with evil designers.

There the wild mountaineer, [*e*]
In barbarous gear,
Hunts Redskins who steal for a living,
And often gets square
By lifting their hair,
In manner not always forgiving.

There antelope meat,
In chunks big and sweet,
And buffalo humps rare and tender;
Also noggins of rye,
In measure termed "dry,"
Are swallowed by folks of each gender;

Swallowed "straight" are the same,
By the flickering flame
Of pine knots swung in the timber,—
While the mug circles round
To fiddle-string's sound,
Till tongues grow waggish and limber.

There Mexican maid,
In scrape and braid,
And deftly worn scarlet reboso—
With bosom displayed
In fashion not staid, [*f*]
And leggings and limbs vastly more so—

This Mexican maid,
In scrape and braid,
Beguiles the love-stricken ranger,
Till jealous Pelado,
In drunken bravado,
Lets daylight "plum" through the stranger.

(Such pastimes occur:
Or rather, they were
Quite frequent in circles termed social,
In those earlier days
When manners and ways
Were ruled by the code bragadocial.

When monte and brag
Would take off the rag,
From almost any profession—
Excepting, of course,
The potential resource,
Of Legislators deeply in session.

And pistol and knife,
In each petty strife,
Usurped the place of the ermine,
In all of those cases,
Occasions, and places,
Which judges were loth to determine.)

There lizards and toads,
In sandstone abodes,
Promiscuous lie strewn all around,
And petrified trees
Stand stiff in the breeze,
Full five hundred feet from the ground.

And the great mastodon,
Whose tusks weigh a ton,
With other defunct-looking fossils,
In petrified slumbers,
Are found in such numbers,
As to puzzle the thirteen Apostles.

There Nature expands in a wonderful way;
Mushrooms, like mountains, spring up in a day;
Waterfalls drop into bottomless chasms,
And the whole region writhes in volcanic spasms.
Grapes grow as large as a Japanese gong,
Pumpkin-vines measure full half a mile long;
Bees, big as sheep, are foddered on corn,
And boys become men before they are born. [*g.*]

APOSTROPHE TO THE EL DORADO.

Oh! golden land of Ophir!
Oh, pleasure ground of gain!
Where earth's remotest loafer
Seeks Paradise in vain;
Where coin is legal tender,
And greenbacks are a drug,
And money pays the lender
A profit mighty snug!

Where roseate buds of Sharon
Develop into bloom
Amid vast deserts barren
And speculative gloom;
While shares of gold and silver
Like waves upon the sea
Take up-and-downward motion,
To be or not to be;

I fain would sing thy praises
In more praiseworthy song,
But, better homely phrases
Than polished words of wrong.
Oh! golden land of Ophir!
Oh, pleasure ground of gain!
The world will have to go far
To find thy like again.

[*a*]. *Gold*—The precious *ore* that helps a man to paddle his own canoe success-fully through the troubled sea of life.

[*b*]. This is the goose that *won* "golden opinions," but invariably *paid* in bad eggs when her luck changed.

[*c*]. Grammar not essential to the sense of the poem, but a serious obstacle to the versification.

[*d*]. *Heathen-Chinee*—An ingenious work of Harte, of which it may be proper to remark that the designers have made all they could out of him.

[*e*]. "Mountaineer" does not refer to any contiguous ground of lofty elevation, although the mirage, so frequent upon the prairies, will often distort and magnify a man so as to make him appear a mountain near.

[*f*]. *Stay*—A nautical term used much in millinery. For example, we say either that a ship miss-stays, or that a young miss stays—which may not be correct, according to circumstances.

[*g*]. We, on this side of the continnent, have small conception of the magnificent scale upon which things are done in California, and the tremendous expenditure of raw material is working out such grand results.

MAN-EATING SHARKS.—A gentleman sends us an interesting paper, which unfortunately is too long for us to print, in which he states that some time ago he read a paragraph in a newspaper to the effect that no well authenticated case was on record of a human being having been injured by a shark. As the statement was entirely opposed to his pre-conceived notions, while sailing from New York to China, in December 1874, he made careful inquiries of the captain and mate regarding their experience with sharks. Although these men had navigated nearly all waters infested with those monsters, neither had known an instance of a person being harmed by one. He wishes to learn from the readers of FOREST AND STREAM anything that will throw light on this subject. It is possible, he says, that all the marvelous stories afloat have arisen entirely in the imaginations of those who have told them.

For Forest and Stream.

Labrador and the St. Lawrence.

Notes of a Trip to the Fishing Posts on the Labrador Coast and Visits to the Light Houses, &c., in the Gulf of St. Lawrence and Straits of Belleisle.

BY J. U. GREGORY, OF QUEBEC.

I WAS commissioned by the Government of the Province of Quebec, to visit the fishing posts on the coast of Labrador, the inhabitants of which were reported in a state of great distress, consequent upon the failure of the fisheries. The undertaking was attended with much anxiety and fatigue, and occupied over a month's time in its execution. I had also to visit and supply several light houses, and humane establishments.

I left Quebec on the 22d of September, on board the government steamer Napoleon III, which is one of the several vessels of which I am the manager. She was commanded by the late Captain Eugene Gourdeau. Mr. John Smith, Superintendent of light houses, and his daughter and the Rev. Mr. Butler, Congregational Church Missionary to Labrador, were also on board. We had a pleasant run down the river St. Lawrence, and on the morning of the 24th at 7 o'clock, reached the first light house at Point des Monts, at the entrance of the Gulf of St. Lawrence. A large amount of supplies had to be landed here, by boats from the steamer, which lay off at some considerable distance from the shore. The light house is a round tower built of stone, 100 feet high, in the lantern of which are placed seventeen lamps, with silvered reflectors twenty-one inches in diameter; it is a fixed white catoptric light seen fifteen miles off, and consumes about 400 gallons of oil every season, being lighted up from the 1st of April to the 20th of December. The entrance to the tower is a round room about fifteen feet in diameter, which serves as a kitchen. The next room above, slightly smaller, is used as a sitting room and parlor; those above as bed rooms for the keeper's family and assistants; there are five in all, the highest being the room in which the man in charge of the lights at night keeps watch, and from which frequent visits are made to the lantern, to see that the lamps are kept properly trimmed, to maintain a perfect uniformity of light, from sunset to sunrise. Outside near the tower is a comfortable house for the purpose of lodging any shipwrecked mariners cast away in the neighborhood, and a store house adjoining, contains a supply of flour, pork, peas, tea, sugar, medicine, and clothing, which is renewed as fast as consumed, or found damaged by age or other causes. At some distance is a stone powder magazine, in which is constantly kept 3,000 to 4,000 pounds of powder for the fog cannon, which the keeper is obliged to fire every hour during fogs or snow storms, to warn vessels beating up, not to approach the treacherous shore nearer than they can hear the report. The keeper is furnished with a horse, carts, and sleigh, to haul water and fuel for his use. His only neighbors are a few Canadian fishermen and Indians, the former engaged in fishing, the latter in seal hunting and trapping wild animals for their oil and fur, which they dispose of for provisions, to trading schooners, during the summer. At noon, having landed all the supplies, we got under way, and the same evening at 6 o'clock reached Seven Islands Bay, where we remained at anchor until 4 o'clock next morning, when we crossed over to the west point of the Island of Anticosti, which we reached at 9 o'clock A. M. Taking my gun with me, I roamed around the point, shooting plover, ducks, and the guillemot, of which I killed in all about fifteen. The light house here is similar to the one at Point des Monts, with fog cannon and humane or provision depot.

We lay to, all night, and left again at day-light, reaching the southwest point at 9 o'clock A. M. This very interesting locality is noted for the immense amount of fossils found on its rocky shore. The tower here is similar to Point des Monts; there is no fog cannon, but there is a

provision depot, which, owing to the frequency of wrecks, in the neighborhood, has succored many poor distressed mariners, who have barely reached the shore with their lives; the keeper and his kind hearted wife and family, dressing their wounds and attending the sick, during an eight months' winter. The Government has recognized the valuable aid rendered by these people, and presented Mr. Pope with an elegant gold watch, and a silver one for his assistant, Mr. Wm. Padeau, both bearing suitable inscriptions. The keeper referred to, Mr. Edward Pope, is a very intelligent, gentlemanly man, and his amiable wife, very lady-like; his home is surrounded with all the attributes of cultivated taste; his young family are being taught by a lady teacher engaged for that purpose, and display considerable taste and ability in music and drawing. He succeeded his father, who was for many years the keeper, and with his mother, died, and was buried on the spot. Their graves being marked by handsome marble tomb stones, surrounded by a neat woodeu railing, kept in perfect order. He has a garden, and cultivates potatoes, carrots, turnips, lettuce, &c., and gets in hay enough for a horse and cow.

It is a strange fact, that while horses and swine thrive on the Island, horned cattle only live eighteen months, excepting at one place called Ellis Bay, where they do remarkably well. I have seen at this spot some fine cattle, owned by Capt. Robert Setter, who is in charge of a provision depot, and carries on some farming operations besides fishing. Why horned cattle fare better at this one point, has not yet been clearly accounted for. Several reasons have been adduced, but none appear satisfactory. It is, however, during the winter months that cattle die, notwithstanding their being well housed and living upon the same hay eaten by the horses. To load supplies at the different points on the island, owing to the shallow approaches, the horse is harnessed to a truck and driven a long distance out in the sea, where the heavily laden boats are met, the supplies transferred to the truck, and hauled ashore by the horse, who sometimes seriously objects to traveling over such a watery road. At 1 P. M. all the supplies being landed we bade good by to Mr. Pope and his family, and with a parting salute from the steamer's cannon, we steered for Cape Rosier Light House on the Gaspe Shore, and arrived opposite to it the same evening, but owing to the unfavorable condition of the wind could not effect a landing, and ran into Gaspe Bay about fifteen miles off, for shelter. Here we amused ourselves catching cod-fish over the side of the steamer, until the wind abated next day, when we returned to Cape Rosier, and this time got the supplies ashore. The tower is similar to the others, with a first order dioptric fixed white light, the lighting apparatus alone costing $18,000. There is a fog cannon, but owing to the number of settlers near by, no humane establishment is maintained by Government. When the inhabitants at such points render assistance to shipwrecked people they are liberally remunerated for their trouble. I did not go ashore, as the time required to supply this light house was too short. I was much amused at the manner in which a horse brought down for the keeper was landed. The poor animal was led out of the stall he had been closely hoxed up in, and could hardly walk, his legs being stiff from the confinement of five days. He was backed up as close to the edge of the steamer as possible. A boat with six men, four of them at the oars, and two seated in the stern, came close to the side of the vessel and when all was ready the word was given, and the horse backed off into the briny deep. He came up nose foremost, awfully astonished at his salt water bath and such treacherous treatment; how he did *snort*, and plunge! The two men at the stern of the boat caught the halter close to his head, when the others rowed with all their might for shore, about three quarters of a mile off, which they reached safely after dragging the poor horse a considerable distance through the water on his side. He, however, soon recovered, and we saw him quietly led up the embankment, gazing in apparent wonderment upon his new home.

On the afternoon of the same day we reached the beautiful Basin of Gaspe, where we were received by our old friend and agent, Mr. Joseph Eden and his son. Mr. Eden made me acquainted with the resident church of England clergyman, the Rev. Mr. Richmond, who before he came to Gaspe, had been several years a missionary on the Labrador coast. The information kindly furnished by him, coupled with what I had already obtained from Mr. Butler, enabled me to form a very fair idea of the amount of provisions I would have to distribute amongst the poor fishermen, and I began to lay out my plans accordingly. We lay wind bound in Gaspe Basin until the 28th, most of the time amusing ourselves catching lobsters, from alongside the steamer. For this purpose, an old iron hoop is crossed in several directions with rope, so as to form a coarse net work, a piece of dry cod-fish is fastened on, and a sinker of stone or brick attached; the whole is then let down to the bottom of the water by a sufficiently long rope, and after a while, steadily pulled up, and one to three lobsters are frequently found feeding on the fish, which they hold fast to till taken off.

How many pleasant days have I since spent with my family in this healthy and beautiful neighborhood, entertained most hospitably by the whole-souled friends residing there, taking an occasional trip up one of the three splendid salmon rivers, where I have struggled with the king of game fishes, and taken hundreds of sea trout. Many a snipe, plover, duck, and teal, has fallen to my gun as they rose from the marsh at the head of the bay. The sailing in the Basin is perfect, and some fine boats are owned by the resident doctor and others, who appear to vie with each other in making Gaspe Basin one of the dearest spots in the world. I am indebted to Mr. Reynolds of Ottawa, and Mr. Curtis of Boston, lessees of the York and Dartmouth rivers, for permission to fish either of these streams. Messrs. Lamnds Brothers, Mr. Curtis' agents, having obtained the permission, I went several miles up the Dartmouth in a bark canoe, and killed five fine salmon, weighing from fifteen to twenty-three pounds, and with a young nephew, also about 300 sea trout, ranging from one to four pounds each, all in one days fishing. The York River at the same time being fished by another party with equal success, although very late in the season.' We could have killed more salmon but did not wish to do so at such an advanced period as the middle of August.

To one willing to forget city hotel accommodations, Gaspe Basin is one of the most delightful spots to rusticate in for a few days I know of. There is a good hotel kept by Mr. William Baker, where plenty of plain food, well cooked, and cheerfully served, with fair accommodation, can be had for one dollar and fifty cents per day. If this, with beautiful scenery and the purest mountain and sea air, will not satisfy the true lover of Nature, he had better try elsewhere. One of the steamers of the Gulf Ports Line leaves Quebec every Tuesday, and after a run down the magnificent St. Lawrence, lands you at Gaspe Basin in thirty-six hours. Through the exertions of the Hon. P. Fortin, Member for the County, and at present Speaker of the Legislative Assembly, telegraphic communication has been established, and he is endeavoring to extend it to other portions of the Gulf, with every prospect of success. On Tuesday, 29th September, we made farewell to our Gaspe friends, who saluted us with three cannon shots, and dipping of flags, and directed our course for the east point of Anticosti. We experienced rough weather and a heavy cross sea, the steamer rolling dreadfully, and the sea washing over her. Was I not sick? Did I not wish myself home again? However, in due course I got over it, and after rounding the point, we found calmer water, and reached the light house at 1 P. M. on the 30th. On our way over from Gaspe, while I was *hors de combat* from seasickness, the steamer stopped at Shallop River to land fresh supplies for the provision depot established there. At East Point we dropped anchor about one mile from shore, and all possible haste was made to land the supplies, as a change of wind from west to east would force us to quit the locality and seek the open sea or shelter elsewhere. The light house is similar to those I have already mentioned.

The Island of Anticosti is 135 miles long and about thirty broad. The inhabitants at the time of this visit (1868) numbered in all about sixty souls, consisting of the three light house and five depot keepers and their families and assistants, and fishermen, separated from each other by long distances, but has greatly increased since, by the addition of some 400 Newfoundlanders induced by the Anticosti Company to become settlers. The black bear, otter, black, silver, and red fox, and marten, are the only quadrupeds found, and numbers are trapped during winter. The interior is dotted with lakes, which are the breeding places of numerous aquatic birds. Near the light house I shot a few snipe and golden plover; both had that fishy taste found in birds near salt water, and were very lean. There are several shallow rivers on the island abounding with salmon and sea trout. A great portion of the island is barren and composed of peat beds, and the whole affords scarcely sufficient support for the few animals which inhabit it. It is estimated to be no where more than 700 feet high. Yet where soil is found it is rich and capable of producing large crops of potatoes, cabbages, turnips, and hay. The climate is too severe for other crops. There are no harbors for large vessels, and dangerous reefs extend out a considerable distance all around. Direction boards have been put up near the beach to assist those who have the misfortune to be shipwrecked, in finding the provision depots, and frequently the crews of missing ships are found at some of these points, whose friends have been for months mourning their loss. During the season extensive seal hunting and cod and herring fishing is carried on by the people from the Gaspe shore. On the elevated parts spruce and birch is found, but none of large growth.

At 6 o'clock P. M. we left for the Straits of Belle Isle, and at 7 o'clock P. M. on the 1st day of October, reached Forteau Bay. We had a fine run from Anticosti, aided by favorable wind. Numerous sea birds flew away on each side as the steamer came plowing on. We saw ahead twenty whales, and several immense ice bergs. We anchored all night at Forteau, which is on the Labrador Shore, in the district of Newfoundland. I was desirous of going on shore to visit the few fishermen, but warned not to do so, on account of the great number of Exquimaux dogs, which kept up a constant howling and barking all night. They are called by our sailors the "Labrador Band;" their music certainly had no charms to sooth, even the savage breast. No other animal is safe unconfined. Some time previous to our visit there was a missionary stationed there whose kind friends had sent him down a goat. Upon its arrival the men in charge tied it outside while they went into the house to announce it. When they came out, it was missing, and nothing of it was found but part of its head and horns attached to the rope. The dogs had torn it to pieces and were fighting over its bones.

At daybreak next morning we left for Belle Isle at the east end of the straits, but could not approach it, owing to the wind being from the west and dashing the waves against the rocks at the only place of landing. We then steered for Chateau Bay or Temple Harbor, twenty-two miles off on the Labrador side. This place derives its name from the high cliffs and rocks resembling chateaus or temples in their formation. We entered a very narrow passage between enormous rocks about 200 feet out of water, and just broad enough to allow the steamer to pass through. Such passes of which there are many, are called by the fishermen "Tickles," and well are they so named, for it is rather a ticklish matter to get through most of them. We found ourselves in a beautiful salt water lake six miles long and about one mile broad, surrounded on all sides by high barren mountains covered with moss, and here and there a small clump of short brush wood. Owing to the great depth of the water the steamer ran close up to the rocks, and yet anchored in thirty fathoms. Five schooners were here loading with herrings and cod-fish for Quebec and Montreal. There are twelve fishermen's huts and a store, or as it is called, a "room" kept by a trader. The people are all from the opposite Newfoundland Shore, and come over every season in June in schooners, men, women, children, dogs, and cats. I had plenty of time to visit them. They are strong and healthy, living almost entirely upon fish and bread, very seldom getting meat, or vegetables of any kind, especially during the fishing season. Their great luxury is molasses, which some of them call "long tailed sugar." They were actively engaged catching and curing fish, and the side hills were white with cod fish laid out on "flakes" to dry, and barrels of the large fat fall catch Labrador herrings were piled up around their huts. My speculative propensity was excited, when I learned that they only got about $2,80 per barrel for such fine fish, and I offered to pay them as high as one to two dollars per barrel more for some, but they answered that they did not dare to sell, as they were indebted to traders for their outfit, and must pay them with fish. I told them to pay in money, for at the rate I was willing to give, it would go much farther to close off their indebtedness. "I cannot sir," they answered. "The traders have ships to load for foreign countries, and load them with fish, not with money, and if I sold you even a few barrels, any of my neighbors having spite against me, would revenge himself by telling the merchant I had done so; he would warn others, and next season when I applied for the advance of an outfit, they would tell me to go to the person to whom I had sold my fish for it. We are entirely at their mercy and must keep on good terms with them."

The success of the fishermen here was due to proper organization, and their facilities for following the coast in suitable vessels, often going two to three hundred miles away to make a catch. We were detained in this bay ten days, during which time I made several excursions in the steamer's boat to its head, and shot four seals, seven ducks and curlew, all of which, with the exception of a specimen or two which I preserved, were handed over to the cook for the table. We ran out three times to try and supply Belle Isle, but were each time obliged to return and wait for a change of wind or calm.

The Labrador Coast is composed of thousands of islands, backed by very high mountains, perfectly barren of wood—and covered with moss, among which are found some berries, one being a small sized cranberry, and very delicate in taste when preserved in sugar. The only wood found as low down as this neighborhood, and for 200 miles higher up the strait, is stunted spruce, which is only obtained in the interior along some ravine where sufficient vegetable matter has been washed down the mountain side to form a soil upon which it grows. Among the thousands of islands can be found well sheltered harbors at every hour's sail, the entrance to the principal ones being marked by a pile of stones built upon the highest or most prominent point, often surmounted with a cross. Such a beacon is called a scaupic. Just outside of Chateau Bay, is Henly Harbor, in which were riding at anchor, twelve to fifteen schooners loading for Montreal and Quebec, one of which put to sea while I was there, was caught in a storm, and became a total wreck. Fortunately all hands were saved. When the people leave at the end of the season to spend the winter at home there is great rejoicing, hurrahs, and the report of firearms may be heard in all directions, I can well understand their delight at leaving such quarters. Soon after my visit I learned that one of the schooners I saw there left with forty to fifty souls on board, all joyful at the prospects of spending a happy winter after their hard fishing season, little imagining that their fond hopes would never be realized; they were soon overtaken by a storm and every soul perished, not far from their own shore.

On Sunday, the 11th day of October, I awoke very low-spirited, thoroughly tired out with the monotony of the ten days' stay in Chateau Bay. I soon after caught the sound of men singing, and a "chuk, clink, chuk." My heart bounded with joy. The crew were heaving anchor, and lustily singing the French-Canadian voyageur's canoe song as an incentive to the work. I was soon among them, working with a will. At last the anchor was weighed, and the steamer swung around and headed for the "tickle." When outside, the wind was found light, although yet from the west, and in a couple of hours we lay off about half a mile from the island, and the boats were dispatched with supplies. As usual, I went in the first boat. When we approached near the island I found that a landing was only to be effected by being hoisted up on a table rock by rope tackle. There is no other way of reaching the top of the island, which is about nine miles long, and inhabited only by the light-house keeper and family, consisting of his wife, son, and three daughters. The only animals known to make the island its home is the Arctic or white fox and Labrador mole. From the high landing place a winding road has been cut out of the rock up to the light-house, which is several hundred feet above. This road is so steep that it is a good day's work for a horse to haul up four loads, each not heavier than three barrels of flour. Everything used here is brought down from Quebec in the steamer. Coals are sent in barrels, the empty barrels furnishing kindling wood. The keeper has two houses—one in use, the other some distance off, and kept in reserve in case the one he lives in should be destroyed by fire. Both are built of brick, and comfortable; the lighting apparatus is the same as the one at Cape Rosier, and of the most powerful and costly description. There is also a fog cannon and provision depot. These people really enjoy the life, particularly the men. The son, now twenty-five years of age, although free to do so, has not left the island since eight years, and the father does not desire to do so either. The mother, with one or two of the daughters (as they grow up), spend an occasional winter in Quebec for the purpose of having them attend school. The same was formerly done for the son. The life of a light-house keeper is monotonous, yet there is about it a simplicity and independence which, with great regularity, endears it to some characters, while others have gone mad by dint of constantly contemplating the same scenes, and hearing the same roar of the sea. The utmost vigilance is expected of him; everything must be kept in perfect condition and scrupulously clean. His first order, which must be implicitly obeyed, is to light the lamps every night at sunset, and keep them burning bright and clean till sunrise.

At two P. M. we had just time to land the last boat load of supplies and hasten on board; the wind was rising, and in a few minutes the waves were dashing against the rocks, a fog sprung up, and with considerable difficulty we ran through the tickle, and I found myself, with a sad heart, once more imprisoned in Chateau Bay, where we were obliged to remain, owing to the density of the fog, until Tuesday morning, October 13th, when the weather cleared up, and we reached Amour Point Light-house at Forteau, which is the last, and similar to those at Anticosti. The light-houses I have mentioned cost from $75,000 to $90,000 each, including out buildings. While the supplies were being landed at Amour Point I was handed two letters, addressed to the captain of the Government steamer. One was from the commander of the British navy vessel Sphinx, the other from the Rev. Mr. Auger, missionary, praying him to assist the distressed fishermen in the district above Blanc Sablon, particularly one large family, named Jones, in most destitute circumstances. The writers were not aware at that time of my mission. We hastened to leave Forteau and at dark the same evening reached Blanc Sablon Bay and cast anchor. Here my mission of mercy began, and did not end for many days.

Concluded next week.

SEA LIONS CAPTURED.—Mr. Henry Paul of Rollinsford N. H., on Tuesday of last week, with the assistance of several men, captured two sea lions in a cove not far from his house, leading up from Salmon River. The old one was eight feet long, and would weigh about 500 pounds, and the young one about 50 pounds. They were lying on the shore a short distance above high water mark, and the old one showed fight, and was captured with much difficulty. They are now on exhibition in Dover.

For Forest and Stream.

HUNTING ON REELFOOT LAKE.

ON the 27th of November last a small party of sportsmen left the city of Memphis for a visit to the celebrated duck grounds of Reelfoot Lake. This lake is situated between Obion and Lake counties, in Tennessee, and extends in an irregular body, varying from one to five miles in width, from near Paducah, in Kentucky, for some thirty miles south into Tennessee, lying at an average distance of seven miles from the Mississippi River. At about twenty miles, however, from the northern end the main body of the lake really ceases, but it is connected by a system of bayous with a number of small lakes extending southwardly, opening into each other by guts or bayous, varying from a few yards to a mile in length, and finally emptying their surplus waters into the Obion River, in Tennessee. Through all of these bayous there is a steady current to the southward, showing the lakes to be supplied by hidden springs, as well as the small drainage of the hills on its eastern shore. The lakes are all dotted with islands of various sizes, clothed with cane or flags, and wherever the water is sufficiently shallow the flags grow up into tussocks or bunches on the spots most favorable to them, leaving interminable lanes and pockets of clear water, within which the sportsman may glide in his boat for miles without being in sight of more than a few yards of open water at any one time. The largest lake ranges in depth from one foot to fifty feet, but the smaller ones are quite shallow, and rarely exceed two feet anywhere.

The origin of Reelfoot Lake is shrouded in mystery. It is filled with trees in some places as thickly as the adjoining forest, only the one is green and groweth up, while the other stands bare and bleak in the desolation of death. The most natural inference is that during the great earthquake, which shook the Valley of the Mississippi in 1811, the earth here subsided with all its forest growth upon it, and the waters have since filled in the chasm. The name is supposed to have been given from that of a small Indian tribe, who long ago lived upon its banks, and concerning whom there are many wild and curious legends current among the hunters and trappers who range its woods and waters.

The sportsman will at once see the unusual facilities afforded by such a locality for the pursuit of wild fowl. In fact, I am quite sure there is no place in the Union where such a body of water can be found with such remarkable natural advantages for duck shooting of every description, whether at passes, over decoys, into flocks, creeping into pockets or flushing them beside the lanes, or, as some of the gunners (men who gun for trade, and do not shoot for sport,) do, to steal upon them in their unguarded hours at the roost.

But with all of this there must be something for the ducks to feed upon, and when the Mississippi River overflows in summer it kills out the yonkepins, moss, and other sub-aquatic plants, upon which the fowl do most delight to feed, and then the sportsman's toil is useless there, as elsewhere. Fortunately this does not happen often, but to our sorrow it did happen last year. So view us then, four precious souls, and all agog to dash through thick and thin *en route* to Tiptonville, Mississippi River, whence by stage we safely arrived in camp at Thomson's Ferry, near the foot of the greater lake. The accommodations here are simply detestable, and we advise all parties going to carry their own tents and grub. On the upper end of the lake, seven miles from Paducah, there is said to be a better place, but we did not go there. The board was two dollars per day, and a dollar for a boatman and boat; or, one can get a boat for nothing and do his own paddling, which does not pay at any price. The feed being bad was against us, but the weather was bright and warm, which was worse. So we only got one day's decent shooting, and that was only one hundred among three of us. In the week we stayed there we only got about two hundred and fifty ducks for the entire party, when in ordinary seasons a poor shot can get between eighty and one hundred a day. Most of these were gray ducks (*C. streperus*), but we found quite a number of the most delightful of all wild-fowl, the green-winged teal (*Q. carolinensis*), which gave really good sport at the passes during a half hour or so on breezy evenings. The curious family of rail was also represented by swarming thousands of its sub-family, the *Fulicinæ*, or coots. These are called puldoos by the natives, but why one could not find out. But the ornithological curiosities were were the cormorants (*Graculidæ*), or perhaps they were darters (*Plotidæ*), as I did not have an opportunity of close examination. These fellows were there in great numbers, and nearly any morning could be seen to collect together in a line of several hundred yards long for the purpose of *fishing*. This was accomplished by moving simultaneously forward, flapping the wings, and beating the water, thus driving the frightened minnows into the centre formed by the closing wings of the line, whence they were gobbled *ad libitum*. Snipe also (*G. Wilsoni*) seemed to be abundant on the marshy islands, and perhaps bred there during the winter; but the nature of the ground forbid my searching for nests. I also killed two of a family of summer acquaintances, the gray-backed snipe (*T. griseus*), which had perhaps left the sea-coast for a change of air.

And now, having spun my yarn, brother sportsmen, I shall, like the famous "Guido," drop her, and go below by my watch off deck. PAT.

ORIGIN OF THE NEWFOUNDLAND.—"Caractacus," in discussing in the *Fancier's Gazette* the question as to whether the Newfoundland dog was indigenous to the island from which he takes his name, says:—

"My own opinion is that European settlers, finding dogs of drought an absolute necessity, and thinking they might improve on the native breeds, imported large dogs of various kinds—as, for instance, the mastiff, the colley, the Alpine spaniel, and the Matin-dog of France—and that the present breed sprang from many roots, and has acquired, from change of climate and other causes, certain peculiarities of its own, and that by careful selection a fixed variety has become established. * * * * * I think the probabilities are that it owes its origin to several types, and that time, selection, and climatic influences have at last worked it into a distinct variety. I have never been able to hit on any record which would tend to prove that such a dog existed when the island was discovered by Europeans; and if any one can point to any that will throw a light on the darkness, I shall be delighted beyond measure."

Fish Culture.

THE NATURAL AND ECONOMIC HISTORY OF THE SALMONIDÆ—GEOGRAPHICAL DISTRIBUTION AND ARTIFICIAL CULTURE.

NO. SEVEN.

BY PHILO ICHTHYOS.

DISMISSING the salmou as an object of natural history, and viewing it as a matter of commerce, it is found that considerable apprehension exists that the annual product of salmon-bearing streams is rapidly diminishing. The English salmon fisheries have nearly failed. The Irish fisheries had largely fallen off, but have lately become productive again by means of artificial culture. The Scotch fisheries had also declined, but have measurably reached their former productive status, by the artificial mode of replenishment. At a not very remote period salmon were extremely plenty in the United Kingdom, so much so as to find a place on the table of the poor, while fish mongers sold it for two pence per pound; so plenty was this fish that farm servants bargained with employers not to be compelled to eat it more than twice a week. Our salmon streams have become impoverished by untimely fishing, and by obstructions from mill-dams; by the poisoning of rivers from the reprehensible habit of throwing dye stuffs into them; by saw-mills, and the various appliances of advancing civilization. A hundred years ago all our rivers natural to this species teemed with salmon. Writers affirm that the North and East Rivers, during the Revolution, not only contained abundance of shad, but salmon also. The rivers of New England were filled to repletion with this right royal fish. The rivers of British America contained such vast numbers that the fisheries of the Provinces for a long period seemed inexhaustible. Besides the inclination of salmon to devour their own eggs, myriads of enemies hover about them while young, with such insatiable greediness that only a very small per cent. reach adult life. Some economists estimate that only one full-growu salmon may be counted upon from a thousand eggs. Sir Humphery Davy calculates that if a salmon produces 17,000 roe, only 800 of these will mature into full-grown fish. Were it not for the extreme fecundity of fishes, the water area would soon become as barren of fish as a desert of vegetative life. But the grand difficulty—the root of the evil, as regards the scarcity of this most estimable fish—is to be found in the improvidence and unaccountable avarice of fishermen, who overfish the rivers and streams. The recklessness of men who gain livings from the capture of fish seem to be utterly regardless of the possibility of a failure of the harvests of the sea. It is found in our country that two hundred patents have been granted for the destruction and capture of fishes, while hundreds more not patented are used, many of which are explosives. Giant powder is in common use in the streams of California, which not only destroys the edible fish, but hundreds too small for use. While traps of all descriptions—nitro-glycerine, and other murderous agents—are being used to despoil and waste our food fishes, only eight patents have been issued for their increase and protection; a plain indication of public sentiment, even to-day, in reference to the protection of the fish and fisheries of our country.

The economic history of the *salmonidæ* in this country may be summed up in a few words. But in connection with this part of the subject some running remarks may not be out of place in reference to inaugurating and sustaining measures calculated to increase the value of our salmon fisheries. If we would reap we must sow. This self-evident truth applies with no more force to agriculture that to aquaculture. The fisheries of the globe, in point of utility, if not in value, are vastly more important than its mines of gold. Gold mines, in process of time, become exhausted, and it is not within the scope of human genius or power, to replenish them again, or recharge the sands, or quartz, with shining ore; but the living, self-producing, and self-augmenting *gift of God* in the wealth of food in the fisheries of the earth, is inexhaustible, if economically managed, rightly fished, and if timely and proper foresight is used in replenishing those great ocean reservoirs of human sustenance. We have no statistics of value of our salmon fisheries ante-dating 1869. During this year there were received at San Francisco from the Columbia River Fisheries, 22,130 cases of canned salmon, each case containing 24 cans, equal to 531,120 cans shipped to this point alone. By good authority it is estimated that the whole product of those fisheries in 1869 reached 800,000 cans—a sum, at twenty-five cents per can, of $200,000. Besides this product, 6,164 barrels of salted salmon were shipped, which, at $10 per barrel, is $61,164, making a total of $261,164. This is the beginning of an enormous industry, which, if properly managed, will furnish a vast revenue to the State of Oregon. Reports of these fisheries for four months ending August 1st, 1872, show 170,000 salmon canned, whose dressed weight was 2,700,000 pounds, value, $430,000; salmon taken for curing, 162,500, dressed weight, 2,600,000 pounds, value $117,000; whole weight, 5,800,000 pounds; total value, $647,000. In 1874 there were put up and shipped from the Columbia River Fisheries more than 20,000,000 pounds of canned salmon. It is estimated that half as much more was cured or eaten fresh, giving an aggregate annual product of one river alone of 30,000,000 pounds of food fish, fit subsistence for kings, and all of this vast product furnished without one dollar for its production!

Estimating this enormous quantity at twenty cents a pound, here is a revenue of $6,000,000 alone from the vast feeding grounds of the Pacific Ocean; and all this supply of human sustenance was prepared for food without price, save for its capture and preservation. And yet, with proper management, many fold may be added to this vast aggregate of food. The weight of salmon taken in the Sacramento and San Joaquin rivers in 1875 amounted to 5,190,750 pounds. The product of the great trout and white-fish fisheries of the inland lakes of the United States and the Dominion cannot amount to less than $2,000,000 annually, while the salmon fisheries of the Dominion alone must amount to more than a million of dollars. The salmon fisheries of Maine will soon attain a high degree of productiveness, and her principal salmou rivers—Penobscot, Kennebec, and St. Croix—under the enlightened management of her able Fish Commissioners, must soon be restored, through artificial means, to their ancient abundance, if the greed to over-fish does not continue until the salmon and all its congeners are exterminated.

The economical value of the salmon lies in the richness and delicacy of its flesh, and the many different methods of preserving it. By means of freezing the newly-caught fish, it may be kept a long period of time without detriment or deterioration, so that it may be distributed in winter so extensively as to find its way to the tables of the inhabitants of all the Northern, Middle, Western, and many of the Southern States of the Union. The canning of its flesh makes it a cosmopolitan food; salting and smoking makes it the cligible food of the poor; and, commercially, it must ere long rank with the cod and herring as a universal food fish. The salmon of the English fisheries only attained anything like a commercial value when shipping in ice was originated. The trade, indeed, was then quite local, until the establishment of railways, which has increased its value so much that it is now only found upon the tables of the rich.

THE U. S. FISH COMMISSION.—Prof. Baird has addressed an official communication as United States Commissioner of Fish and Fisheries to the Speaker of the House of Representatives, asking for an appropriation of $17,500 for the purpose of continuing the introduction and propagation of useful food fishes in the public waters of the United States during the present season. The argument which accompanies Prof. Baird's communication is exhaustive and to the point, showing the great work already accomplished by the Commission and the amount there is yet to be done. A good point is made in the fact that the work prosecuted by the United States Commission is in no case that which would be carried on by State Commissions or by private enterprise. The States of Iowa, Minnesota, Ohio, or Pennsylvania would not find their advantage in going to any great expense in the way of stocking their streams, in view of the fact that the fish, when mature, would, on their return, enter the mouth of the Mississippi, and traverse all the intermediate States before arriving within their borders, with a certainty that a large portion of the catch would be secured by non-citizens. A fish to which it is proposed to devote a portion of the appropriation, should it be made, is the European carp, a species eminently calculated for the warmer waters of the country, especially the mill-ponds and sluggish rivers and ditches of the South. This fish has been domesticated for thousands of years, and furnishes the principal food of the Chinese. Living on vegetable matter instead of animal, it can be multiplied at very little expense in restricted waters.

A very elaborate table accompanies the letter, from which we learn that there has been hatched and distributed by the United States Fish Commission, of shad, 18,689,550 fish; of Penobscot salmon, (*Salmo salar*), 2,294,565 fish; of California salmon, transported to new waters of the United States, 5,153,740 fish. As this vast total of 26,137,855 fish turned loose, to also increase and multiply, represents but the labor of three years—1873-4-5—it is too soon to judge of results by the amount accomplished; but unless fish culture is a failure, and we have abundant evidence that it is not, the country should be to-day richer by many thousands of times the total amount already expended in the work. We trust that the Committee on Appropriations will take a similar view of the case and at once report a bill making the appropriation.

—The Livingston Sportsmen's Association of Genesco, says the Dansville *Express*, last week put into the waters of Conesus Lake 30,000 young salmon trout. The trout were procured at the State Hatching House, Caledonia, and Mr. E. Sackett, having the matter in charge, says that the fish were transported very successfully, and with hardly a perceptible loss. Conesus Lake already furnishes good fishing, and with the restocking it has received during the past few years an improvement may be expected.

BLACK BASS IN SOUTH JERSEY.—Capt. Milton P. Pierce, who last season stocked numerous public and private waters in South Jersey with this variety of fish, writes us, under date of April 6th, as follows:—

"In October of 1875 I placed black bass of different ages, and varying from three-quarters of a pound to three pounds in weight, in some of the small reservoirs at Aqualdale, keeping them there till January 1st, 1876, when I transferred them to a pond constructed expressly for them, covering nearly two acres, and varying in depth, the deepest points being about 10 feet. In November the larger bass gave every indication of hibernating, keeping close to the bottom of the deepest places in the small reservoirs, but the smaller ones swam around as usual. During the brief time that the bass pond has been frozen over during the past winter some of the smaller bass have been seen swimming about in shallow water. Before flowing the pond I prepared gravel beds, that are from two and a half to four feet under water, for them to spawn on. They are now reconoitering these beds, and evidently preparing for business."

—The first flock of geese passed over Portland, Me., Mr. L. Redlan writes, and the gunners are having good shooting at blue-bills and black ducks. Blue-birds and song sparrows were seen March 31st.

Natural History.

[The Department is now under the charge of a competent Naturalist, patronized by the Smithsonian Institution, and will henceforth be made a special feature of this paper. All communications, notes, queries, remarks, and seasonal observations will receive careful attention.]

THE BOHEMIAN WAXWING.

IT is rare that ornithologists have a good opportunity to study the habits of the Bohemian waxwing (*Ampelis garrulus*), which is an inhabitant of circumpolar regions, and only irregularly wanders into the limits of the United States during the coldest winters. Our knowledge of the life of this bird is therefore very meagre, and it is with especial gratification that we present the appended communications from gentlemen in Minneapolis, Minn., where the waxwings have been abundant during the winter. The reader will call to mind previous notes upon this bird which have appeared in FOREST AND STREAM from Capt. Bendire and others. The first letter is from Mr. P. L. Hatch, and is as follows:—

—The 23d of February was very cold here, the mercury indicating more than 20° below zero. A change to milder weather followed, and on the 25th it was delightfully pleasant, on which day I met a flock of 50 or 60 Bohemian wax-wings (*Ampelis garrulus*). They were distributed loosely on bushes and shrub-oaks, and a few perched on the balwarks of the bridge over a hollow containing the Silver Cascade. Pausing to observe these by no means common winter visitants from the regions still further to the north of us, I was surprised to see that they were busily engaged catching insects in the air, precisely after the manner of the true flycatcher. I strained my eyes to see if I could detect the insect in the clear sunshine, but its proportions were too small. Yet I could distinctly see the birds open their bills in the act of seizing them. Some teams passing over the bridge abruptly, brought them all together in an oak, the top of which was about on a level with and close to the abutment of the bridge. Here I stopped my horse within fifteen feet of them, and so intent were they in their watch for their new food that they permitted me to observe their individual markings, and occasionally count the several "sealing wax" tippings of their wings, a treat never before my fortune to enjoy to such an extent. I finally left them, but returning an hour later found them still darting out into the air at all elevations from close to the ground near the creek to 100 or 150 feet elevation, and seizing something invisible to me, in no way different from the warblers or flycatchers. Has this characteristic been noticed by naturalists? and what were they eating?

—

Mr. Thos. S. Roberts also recorded his observations in the following notes:—

In your issue of February 17th, I noticed a communication in regard to the Bohemian wax-wing or chatterer, asking whether it had been observed during the past winter in any other part of the United States than Oregon. A large number of these birds have spent the winter about Minneapolis. They made their appearance early in December, and are still present, (March 22d). They are all almost invariably to be seen in flocks, usually of 10 to 30 individuals, but sometimes of 100 or more. They are seldom found outside the city limits. Their food has been what few berries they could find, buds, and almost any eatable thing which they could pick up. Notwithstanding this seemingly precarious manner of living, they are in good condition. These birds can easily be approached within gunshot, and often much nearer. When shot at they fly off in a close, compact flock. The iris of the chatterer is dark red, but varies somewhat in different individuals.

EARLY SPRING ON THE HUDSON.

EDITOR FOREST AND STREAM:—

In response to your "Invitation," I send you some of my notes for February and March taken in this vicinity:—

February 13th.—Clear and warm. Found a single liver leaf (*Hepatica triloba*) in bloom on a high rocky hill facing the south. These flowers always bloom at this spot much earlier than at any other place in the vicinity; but I never found them before earlier than February 23d. Saw a butterfly in the same place.

February 20th.—Several hepaticas in bloom on the same hill.

February 22d.—Followed a pair of blue-birds till the female entered a hole in the dead limb of an apple tree, very probably its annual nest. It appeared again in a few moments, and flew off with its mate, which had remained near by singing. This is the first indication of house cleaning that I have noticed among the birds this season.

March 5th.—Clear and warm; light south wind. Saw a flock of about twenty robins moving north—the first real spring birds that I have seen; also saw several red-winged blackbirds (*Agleaus phœniceus*) in the bushes bordering a pond.

March 6th.—Another warm day. More red-wings have arrived during the night, and they are now quite numerous; saw a flock high in the air flying north. Started a flock of six black ducks (*Anas obscura*) at the pond. The robins are getting to be common.

March 7th.—Saw a rusty grackle (*Scolecophagus ferrugineus*). Noticed bluebirds looking around for a place to build; flying about old dead stumps and holes in trees.

March 12th.—Golden-winged woodpecker seen.

March 13th.—Noticed several fox sparrows (*Passerella iliaca*).

March 22d.—Crow blackbirds have arrived.

March 23d.—Phœbe bird (*Sayornis fuscus*) and cow-bird (*Molothrus pecoris*) have arrived. The phœbe is rather late this spring; last year it made its appearance March 13th.

March 24th.—Hylas heard piping in the evening.

March 31st.—Several violets in bloom on the lawn; these violets were originally cultivated, but have spread themselves over the lawn, where they have been growing for years. They always flower much earlier than the real wild violet and still retain their sweet scent.

Riverdale-on-Hudson, April 5th. E. P. BICKNELL.

NOTES FROM OUR CORRESPONDENTS.—W. H. Bernard (Wilmington, N. C.,) informs us that a young woodcock was caught in Duplin county, N. C., March 21st, which was about six weeks old, and an old one which seemed to have a nest near by. This is considered an unusually southern point for this bird to breed.... During the second week in March robins, blue-birds, and cedar-birds were seen at Glen's Falls, N. Y., and strangest of all a whip-poorwill was heard. DeKay says: It arrives the latter part of April, which is probably a rather early date for the northern portion of the State (A. N. Chency).... "C. S. R." writes that at Niagara Falls the first robins were seen March 8th, and bloc-birds on March 12th; but as six inches of snow fell on the 20th, the robins becoming weak from want of food, became food themselves for the vast number of crows that go there to pass the winter. No other spring birds had appeared up to March 24th.

BIRDS OF FORT WAYNE, IND.

BY G. AUG. SMITH.

I HAVE been collecting birds about sixteen years in this vicinity, and am able to send you a list of species likely to be found about here in winter. Some, like the evening and pine grosbeaks, and the wax-wing, make their appearance only at long intervals. The list is as follows:—

Golden eagle. Rare.
Bald eagle. Not rare.
Gray eagle. Not rare.
Red-tailed hawk. Rare in winter; common in summer.
Great-horned owl. Common all the year.
Mottled owl. Common winter and summer.
Barn owl (*Strix flammea*). Rare; has occurred several times in winter.
Long-eared owl. A winter bird; rare in summer.
Short-eared owl (*Brachyotus palustris*.) Seen in winter only.
Barred owl. Common winter and summer.
Sparrow owl (*Glaucidium passerinum*). *Occasional in winter only.
Snowy owl. This is found, but not every winter.
Downy woodpecker. Common at all times.
Hairy woodpecker. Common in all seasons.
Yellow-bellied woodpecker. Not seen every winter.
Black log-cock. Not rare in winter, and common in summer.
Red-bellied woodpecker. Common in winter, and not rare in summer.
Red-headed woodpecker. Not seen every winter; common in summer.
Golden-winged woodpecker. Rare in winter; common in summer.
Kingfisher. Not taken every winter, but common in summer.
Golden-crested wren. Common this winter; none in summer.
Wax-wing. Not seen every winter, and never in summer.
Cedar-bird. Common throughout the year.
Butcher-bird. Common in winter; rare in summer.
White-rumped shrike. Common in all seasons.
White-bellied nuthatch. Common at all times.
Brown creeper. Not rare either winter or summer.
Tufted titmouse. Commonly found all the year.
Chickadee. Common both summer and winter.
Shore lark. Common in winter and summer.
Evening grosbeak. Occurs some winters.
Pine grosbeak. Not observed every winter.
Purple finch. Common during the winter, but none are seen in summer.
Yellow-bird (*Chrysomitris*). Remains throughout the year.
Red crossbill. Comes some winters.
White-winged crossbill. It is found some winters, but never in summer.
Red-poll linnet. Common in winter; none in summer.
Snow bunting. Common in winter only.
Lapland longspur. Common in winter; none in summer.
Snow bird. Common during the winter.
Chipping sparrow. Common in winter; rare in summer.
Song sparrow. Not found every winter; abundant in summer.
Cardinal grosbeak. Common both summer and winter.
Crow. Common through the year.
Blue jay. Common at all times.
Wild pigeon. Common in summer, and rare in winter.
Mourning dove. Common throughout the year.
Wild turkey. Never rare.
Ruffed grouse. Common winter and summer.
Prairie hen (*Cupidonia cupido*). Not rare at any season.
Quail (*Ortyx virginianus*). Common always.
Red-breasted merganser. Occurs in winter.

*This is a bird of the Pacific coast. Is there not an error here?—EDS.

AMERICAN FALCONIDÆ, ETC.—Mr. Robert Ridgway has long been a special student of the hawk family (*Falconidæ*). He has just printed as a part of the Bulletin of the U. S. Geological Survey, Vol. II, No. 2, a paper of 82 pages and two plates, entitled "Studies of the American Falconidæ." Mr. Ridgway has taken up the 15 genera following *Nisus*, which is represented by the sharp-shinned and Cooper's hawks. Most of these are South American, and many of them the author has defined anew. The characters and synonomy of each species are given, and its variations of plumage discussed. The paper is an important addition to the literature of the classification of birds.

The same Bulletin contains a more readable, if not more important paper, also from Mr. Ridgway's pen, upon the Ornithology of Guadalupe Island, based on notes and collections made by Dr. Edward Palmer. Guadalupe Island is off the coast of Southern California, 220 miles southwest of San Diego. Every one of the species is distinct from, though nearly related to, those found on the neighboring mainland; among the Passeres, the closest resemblance is to Rocky Mountain forms. The land birds inhabiting the islands during the breeding season are the following: *Regulus calendula* var. *obscurus*, Ridgw.; *Salpinctes obsoletus* var. *guadeloupensis*, Ridgw.; *Thryomanes brevicauda*, Ridgw.; *Carpodacus amplus*, Ridgw.; *Junco insularis*, Ridgw.; *Pipilo maculatus* var. *consobrinus*, Ridgw.; *Colaptes mexicanus* var. *rufipileus*, Ridgw.; *Polyborus lutosus*, Ridgw.; and three birds unidentified.

WINTER RARITIES IN MINNESOTA.

MINNEAPOLIS, MINN., April 5th, 1876.

EDITOR FOREST AND STREAM:—

In addition to the Bohemian wax wings, of which I have already written you, we have been favored this winter by the presence of a considerable number of evening grosbeaks (*Hesperiphona vespertina*). They arrived about the 19th of December. Last year they remained here as late as April 23d—after many of the summer birds had arrived. This bird is much more domestic in its habits than the chatterer. They frequent an island in the Mississippi River at this point, which is covered with dwelling houses, and is the constant thoroughfare between the east and west divisions of this city. But on this island are a great many large trees. They alight on and around the houses, but are nevertheless somewhat changeable in the degree of their timidity, at one time allowing close inspection, and then again being rather shy, although one can always approach within twenty or thirty yards of them, and I think that, on the whole, they may be regarded as tame and unsuspicious. Like the purple finch (*Carpodacus purpureus*) they often feed by hanging out on the ends of branches, and tearing of the buds which form a great portion of their food. Such fare they could easily obtain in the woods as well as upon this public island, so that their preference appears to be for the society of man. They have a sharp, clear whistle, and at times a note somewhat resembling that of the chatterer. Their flight is undulatory and erratic though quite rapid. One very marked and constant difference in plumage between the male and female of this species is to be found in the coloration of the tail feathers. In the female these are all tipped (on the inner web) with pure white, the outer feather broadly, and the outside one of all on each side has a small spot of the same color on the outer web also. The extent of these markings seems to depend upon the age, being less in the younger specimens, and increasing with age. In the male there is only a very slight indication of such marking, and that is on the extreme tips of the outer feathers alone.

During February and March of 1875, the pine grosbeak (*Pinicola enucleator*) was very plenty in this locality, but I have seen none as yet this season. A flock of golden-eyed ducks (*Bucephala americana*) has passed the winter in the open water below St. Anthony Falls. A few ducks remain in that pool every winter, despite the length and severity of the season. THOMAS S. ROBERTS.

DESPISED FOOD FISHES.

WASHINGTON, April 3d, 1876.

EDITOR FOREST AND STREAM:—

In reply to several inquiries as to what I meant by saying that Europeans eat "rays," I will say that it was written *rays*, and that the order *Rales*, according to Gill, includes nine genera of these singular fishes, from the sea-bat, or devil-fish of the Carolina coast (*Ceratoptera vampirus*), the rays, skates, stingaree, etc., to the torpedo, or cramp-fish (*Torpedo occidentalis*). These fish are eaten in Europe, but through prejudice are but little used as food in this country even by the very poorest class. There are tons upon tons of fish thrown away, fed to hogs, or made into fertilizers on the coast, and people within a few miles suffering for food. I have heard a fisherman on Long Island Sound say that he was never poor enough to eat sturgeon! His grandfather had probably told him that it was not good, and he had not had independence enough to try this excellent fish. This predjudice is common, and if you have never eaten sturgeon, properly cooked, just try it at the first opportunity. Get a few slices, moderately thick, put them in a pot or pan of water and parboil them to get rid of the oil; then roll in crumb of cracker or egg, just as you would a veal cutlet, and fry. This makes a veal cutlet that beats the original by far, and you are sure that it is full "six weeks old," as the butcher always certifies in regard to the veal. FRED MATHER.

ARRIVALS AT THE CENTENNIAL AQUARIUM FOR THE WEEK ENDING APRIL 8TH.—Six gopher turtles, *Testudo polyphemus*, habitat Florida. Presented by Mr. Greene Smith. One rough chub sucker, *Campostoma anomalum*, habitat New York. Presented by Mr. Harry Bell. Fifteen grayling (young), *Thymallus tricolor*, habitat New York.

FRED MATHER, Supt.

Sea and River Fishing.

FISH IN SEASON IN APRIL.

Brook Trout, *Salmo Fontinalis*. Land-locked Salmon, *Salmo Gloveri*.

☞For list of seasonable trout flies for April see our issue of March 23d.

FISH IN MARKET.—The supply of fish during the week has been liberal, and prices without material change. North River shad were abundant, the best roe fish selling for 75 cents each, while Delaware River's bring 50 cents; striped bass are worth 16 to 20 cents per pound, according to size; smelts, 15 cents for Northern and 20 cents for green; salmon, 50 cents; mackerel, 25 cents each; white perch, 18 cents per pound; Spanish mackerel, (frozen) 50 cents; green turtle, 33 cents; terrapin, $12 per dozen; frost fish, 8 cents per pound; hahbut, 16 cents; haddock, 8 cents; codfish, 10 cents; blackfish, 15 cents; flounders, 10 cents; eels, 18 cents; lobsters scarce, 13 cents; turbot, 25 cents; scollops, $1 per gallon; soft clams, 40 to 60 cents per 100; whitefish, 20 cents per pound; pickerel, 18 cents; perch (yellow), 12 cents; brook trout from Canada, 50 cents; Long Island, $1; pompano, $1; hard shell crabs, 40 cents per dozen.

STRIPED BASS AT NEWBURGH.—It having been reported that there was good striped bass fishing in the vicinity of Newburgh during the spring months, we have been at some pains to ascertain definitely as to the truth of the report. The result of our inquiries is to the effect that there are a few fish, ranging from one to three pounds, caught, but not in numbers sufficient to warrant an expedition for the purpose. During the past week small striped bass have been taken in large numbers near Poughkeepsie. There can be no doubt but that these fish pass the winter in fresh water near the head of the river, and probably on their way down are "not on the feed" until salt water is reached. They pass through Spuyten Duyvil Creek into the Harlem River, and then into the numerous small creeks which indent the Westchester side of Long Island Sound, where they commence feeding on shrimp.

—More than one of our readers will be gratified to learn that the celebrated salmon pictures of Walter M. Brackett, Esq., of Boston, entitled the "Rise," "Leap," "Struggle," and "Landed," which were sold at a high figure to an English connoisseur some time ago, have been duplicated by the artist, and will be included in the Massachusetts collection at the Centennial Exhibition. They are now on exhibition in Boston, together with the rest of this collection for Philadelphia, and will be for some time to come. If not sold at the Centennial, they will be offered in New York next fall. They are greatly admired, and greatly exceed anything of the kind extant, so far as we can learn. We understand that Mr. Brackett has several times come within an ace of selling them, though the figure, which we believe is $4,000 for the set, may seem high in these tight times. However, they are cheap at a much higher price.

WATERPROOFING FISH LINES.—Some process for waterproofing silk and linen lines so as to render them equal in quality to the best imported article, has long been sought by American anglers; and while experiments with *silk* lines seem to have been quite satisfactory, the methods employed on *linen* lines have been wholly inadequate. We were cognizant long ago of the eminent success attained by Walter M. Brackett, Esq., of Boston, in manipulating silk lines with boiled linseed oil, and so stated in this journal at that time, having been permitted to make careful examination of the specimens thus prepared. Subsequently, in answer to a correspondent, it was asserted in our columns by an unfortunate inadvertence that *linen* lines were so treated; and

several of our readers have been experimenting with the recipe ever since, with no success at all! Quite lately one gentlemen sent us several samples of these lines, which were rotten, and we referred him to Mr. Brackett; one effect of which communication has been to draw out the following letter which we trust will be received as *ex cathedra* and relieve puzzled gentlemen of any dilemma they may have reached. The information given will certainly be valued. The samples of lines can be examined at this office by any one curious to see them:—

STUDIO, 41 Tremont street, Boston, Mass.

EDITOR FOREST AND STREAM:—

You make me responsible for the statement that linseed oil is the best substance for preparing *linen* lines. It is bad enough to be held accountable for what I do say, but to be obliged to father what some one else says is more than I bargained for. Instead of recommending linseed oil for the purpose, I beg leave to say that a linen line so treated is good for one season, and one only; nor have I ever found any substance that serves the purpose desired. For silk lines I know of nothing better than boiled linseed oil. It works to a charm, as the accompanying specimens will prove to you. Nos. 1 and 2 have been used eight years, and Nos. 3 and 4 four years. If you know of any process that will give better results, have no doubt your readers would be glad to know it, as would also yours truly,

WALTER M. BRACKETT.

The subjoined corroborative letter from an eminent authority will serve to further put the question at rest, so far as using linseed oil for linen lines is concerned. While we regret having misled our readers, it is consoling that an error has been the means of eliciting so much valuable information. Anything further relating to water-proofing processes will be received with thanks:—

PROVIDENCE, R. I., April 8th, 1876.

EDITOR FOREST AND STREAM:—

I find in your paper, under "Answers to Correspondents," that "linseed oil, for water-proofing linen fish lines, is recommended by Walter M. Brackett." Now, I am not personally acquainted with the authority named, but hope to be ere long; but as my experience has been different from his, I presume no offence will be given if I mention the fact that one years ago I water proofed a linen bass line, which would sustain a weight of twenty-four pounds without parting before the oil was applied, and within one month afterwards it was not as strong as common twine. I enclosed find a sample. About that time an angling friend tried the same experiment, with the same result. Soon after making the experiment referred to, I procured "The American Angler," by Thad. Norris—a book that is indispensable to the angler who wishes to make his own pickle"—and found on page 673 (new edition) that linen lines *"should never be soaked in linseed oil."* Two years ago I tried rubbing linen lines with paraffine, which seemed to preserve the line, and make it run better through the guides. If I was to experiment farther, I should try saturating the line with fine paraffine, dissolved in pure benzine. This preparation I have used as a water-proofing for leather fly-hooks, and find it perfectly satisfactory. If any one tries this I hope he will record the results, and send the same to FOREST AND STREAM. ESPRIT FORT.

THE "QUIET" CLUB of Towanda, Pa., is composed of several leading gentlemen of Pennsylvania, who are fond of the angle, and who we sincerely trust will experience all the benefits anticipated from its organization. Last Monday, it enjoyed a game supper and pleasant time generally while overhauling rods, lines, and flies, preparatory to opening the trouting season. A E. Chamberlin sent regrets for his absence accompanied by a large basket of speckled trout, which proved a most opportuno gift and were much enjoyed. "Success to your fishing," gentlemen!

—The first weakfish of the season was taken near Morices, L. I., last Friday.

—The following is a table of approximate weights of fish in good condition, predicated upon their length, which is published by Eaton & Deller, of Crooked Lane, London, England. Although the English fish vary in some degree from ours in comparative weights and measurements, still the table given will serve as a nearly correct guide to anglers in American waters. Those who have no spring balances in their kit may have a two-feet rule, which is handy to carry, and with this they can ascertain how many of the fingerlings they catch go to the pound. No doubt the gentlemen will find the table serviceable in the coming season and thank us for it:—

TABLE OF APPROXIMATE WEIGHTS OF FISH ACCORDING TO THEIR LENGTHS.

Length.	Weight.							
	Salmon.		Trout.		Grayling.		Pike.	
Inches.	lbs.	oz.	lbs.	oz.	lbs.	oz.	lbs.	oz.
0	....		0	4½	0	4½	....	
10	....		0	6½	0	6½	....	
11	....		0	9	0	9½	....

NEW YORK—*New Hamburgh, April 9th.*—Fishing at this point has not commenced as yet, owing to the frequent heavy rains having swollen the streams. In short ten days, if the weather is pleasant, the anglers at Dutchess county will be prepared for what little sport there is to be had in the way of trout fishing. Our sportsmen have been seized with the restocking fever, and our now depleted streams will afford sufficient sport to make quite an event of the opening of the season. Half a dozen herring were caught in a fyke by one of our fishermen this week, which is a very unusual event for so early in the season.

BLUE JAY.

CONNECTICUT—*Higganum, April 5th.*—Water rising in river. To-day the first shad net was set, for the season, in it was caught a striped bass three feet, three inches long, weighing twenty-seven pounds—a perfect beauty. Quite a number of bass are taken here every season, but few as large as this. The net is about four rods long, and is set in the eddies along shore. Expect shad soon. Alewives are plenty.

MASSACHUSETTS—*New Bedford, April 9th,*—Fish are becoming abundant here. Cod, halibut, smelts, herrings, &c., are caught either at the Vineyard or on our shores, quite plentifully. All the trout brooks here are overflowed and fishing in them is impossible, except near their mouths.

CONCHA.

MOVEMENTS OF THE FISHING FLEET.—There have been 36 arrivals of the fleet the past week, 26 from Georges and 10 from the Banks. The receipts have been 1,040,000 lbs. of codfish and 845,000 lbs. halibut. Prices for halibut have ruled at 2½ and 1½ cents per pound. Fresh cod and haddock have been in light receipt and selling for $2.50 per hundred weight.—*Cape Ann Advertiser, April 7th.*

NEWFOUNDLAND SEAL FISHERIES.—The latest reports from Newfoundland relative to the prospects of seal fishery are not encouraging. Many of the vessels were still in sight off shore on account of ice and adverse winds. Several sealing vessels have been crushed and sunk by the ice. Great destitution prevails in many parts of Green Bay.

FISHING CHARTS, WHEREBY THE MIGRATION OF FISH MAY BE DETERMINED, AND THE BUSINESS RENDERED MORE SUCCESSFUL.—The United States Fishery Commission, under the direction of Prof. Spencer F. Baird, has done much within a few years to settle disputed questions concerning the marine fauna of the American coasts, the habits and movements of our migratory fish, and the dangers to be apprehended from over, unscasonable and improper fishing. The Signal Service Corps has accomplished a beneficent work in establishing its posts along the coast to warn mariners of approaching storms, and in its dissemination of weather probabilities. If the combined service of the two boards could be utilized to furnish fishing probabilities, so that our fishing marine could make approximate calculations as to the prospect of success of different branches of the fisheries, it would be a boon indeed. The great disadvantage of our leading interest is its uncertainty in various phases.

Fish are capricious, and though they seem to follow certain general laws in their movements, it is next to impossible to predict with any degree of certainty the probability of success in any single department of the fisheries.

Such a plan is under consideration in Scotland, where a movement has been inaugurated looking to the acquiring of such information as shall prove of service to the herring fishermen on the Scotch coast. The Commissioners of the Fishery Board of that country, conceiving the idea that the temperature of the sea and other meteorological influences had something to do with the fluctuations of the herring-fishery, instituted a series of experiments by which it was shown that during the periods when heavy catches of these fish were taken the thermometer was usually high and steady, the winds light or moderate, and electrical phenomena wanting; and that on the other hand when the catch was small it was found that the barometer was low, strong winds and unsettled weather prevailed, and thunder and lightning was frequent. The Commissioners of Irish Lights are engaged in similar investigations, and the German government has appointed a Commission in connection with a Meteorological Committee, to inquire into the physical condition of the Baltic Sea.

Science will yet give us a fishery chart of the courses followed by fish in their migrations from place to place, and of the chances of the successful pursuit of any particular fishery at a particular place and time.—*Cape Ann Advertiser.*

TROUT AND SALMON ANGLING.

OAKLAND, Cal., March 25th, 1876.

EDITOR FOREST AND STREAM:—

To the chagrin of our anglers, the young salmon or grilse, which for these two last winters have afforded such good and convenient sport at the above point in bait fishing, have at present, at any rate, almost entirely disappeared from our bay, and, I presume, are gone up the Sacramento and San Joaquin Rivers to their spawning grounds. They migrated from the ocean to our bay, bound for the above streams, earlier by a month or six weeks this season than they did last year. A great many were caught this last winter, but not near so many as in 1874-5. The fish taken lately have been much larger, of course, than those of the previous years, having had another year's growth; but they have certainly fallen off in quantity. Some have been taken within these few days weighing from twelve to seventeen pounds; but they are scarce. They seem to bite now at any time of the tide, whereas the greater number were previously nearly always captured about an hour before and an hour after high water; not more than five to ten are taken daily. But the most exciting of all fishing seasons is now on the 1st of April, just upon us. Trout fishing, owing to the great rains we have had this fall, winter, and spring, filling our rivers and creeks, we expect much good sport this year. Until within the past few years angling, as a legitimate recreation, has been neglected on our slope. The spirit of gain has ruled the minds of our business men, as elsewhere generally, and time spent in out-door amusements has been hitherto looked upon a good deal as money too much wasted. But boaters are changing much lately in this respect. During the past two or three years there seems to have been awakened a quiet influence here (which, upon my writing somewhat on field sports, in some of our papers, I have myself, perhaps, done something to encourage) exerting itself among the minds of our business people, bidding them, for their own benefit, to play more and work less, and many a hard-worked clerk has now cause to bless the effect of this influence, when he has been allowed to take two or three weeks' vacation every year, and so recuperate his vital energies.

Within a radius of fifty miles of our city there are at least twenty localities where sport may be had. There are the Water Company Lakes, or Lake Merced, of the Acclimatizing Society, (now soon probably to be amalgamated with a new and large sportsman's club, of which more anon), in either of which, for a small fee, permission may be obtained to fish, and fine fishing is to be found, as it was last year. Then there are a great number of creeks and streams inland, north, south, and east, where are frequently taken from thirty to fifty trout in a day's fishing. Only about two years since a party of three, of whom my nephew was one, left the city on a Saturday afternoon for a short trip back of Mount Tamalipas. They returned Monday morning in time for business, and brought back ten "salmon trout," really a species of land-locked salmon, which weighed sixty-five pounds dressed. Several others, who fished in the same lagoon, (sometimes having access with the ocean), connected with a brook, caught a number of the same fish (as well as brook trout), weighing from three to eight pounds each. Another party took over one hundred mountain trout from a creek, and others took nearly three hundred in two days.

The lakes in the mountains, and the streams running therefrom, also afford a vast amount of fishing to those who have time to go so far. Tahoe, Summit, Cascade, and other lakes are full of salmon trout (silvery salmon) and common trout, weighing from one pound up to as high as thirty pounds, and our mountain streams are alive with the speckled beauties.

E. J. HOOPER.

SPLIT BAMBOO.

ITHACA, N. Y., April, 1876.

EDITOR FOREST AND STREAM:—

My "few remarks" in your issue of the 9th ult., concerning one way of making a split bamboo rod, and stating, by way of comparison, some objections to the Krider rod, seem to have stirred up a swarm of "bonest men and anglers," who will have it that Krider can beat all creation in the making of a rod. They undertake to say—not that John Krider can make a better rod than anybody else—but that his peculiar method of putting the strips together is the best way to make one. In order to "prove their case" they are compelled to assert that the greatest strain comes upon the centre of the rod, and therefore Krider crowds as much of "the enamel" to the centre as possible.

One of your correspondents imagines he has settled the question by citing the philosophical truism that "a chain is no stronger than its weakest link." From which he deduces the conclusions "that the same amount of enamel inside or outside will produce equal strength." That gives up half the argument at least. I suggest to J. B. C. a practical experiment. Take a piece of sound iron gas-pipe, with a calibre of say three-quarters of an inch; length, say four feet. Lay it with each end resting two inches on a block. Weight down the centre till it bends and the deflection is say four inches. Next heat and hammer the same piece of gas-pipe to a solid cylindrical rod of the same length and temper. Treat it as before, and see which requires the greatest weight to produce the same deflection. If the gas-pipe carries the heaviest load, perhaps that might convince J. B. C. and the others that a trout rod is not generally used in the same manner as a chain.

I see no reason to change my views expressed in my article, printed in your issue of March 9th, to the effect that all the enamel should be upon the outside.

Your correspondent W., in March 30th, styles my four objections to the manner of making the Krider rod "imaginary." Every one of them is so obviously a fact that I can well leave them for W.'s further consideration. I commend him, and all advocates of the Krider system, to the perusal of an admirable article signed "Ted Grayson," in your paper of March 23d. Notwithstanding T. G. has a rod that will go off fishing of itself, when the balmy west wind scatters the apple blossoms, yet I commend him to the sight and the handling of the Hexagonal Rod.

H.

SECOND RATE FISH IN ADIRONDACK WATERS.

SYRACUSE, N. Y., March 31st, 1876.

EDITOR FOREST AND STREAM:—

"C. C.," in your issue of March 23d, correctly states that pickerel are found in Lake Sanford, and others of the more easterly Adirondack Lakes. They were taken there from Schroon Lake many years since, which lake had previously been stocked from Champlain. In 1865 a lot of these "fresh water sharks" were let loose in Long Lake, to the indignation of most of the residents, and all of the sportsmen. For a few years Buttermilk Falls opposed a boundary for their influx into Racquette Lake. In 1869, through the instrumentality of some of "Murray's horde," they were transported over the falls, and from thence have spread throughout that pride of the North Woods—Racquette. Since then black bass, through the New York State Agency are wantoning in the same water. Now, the last is a game fish, I acknowledge. Yet, still, recalling my piscatory sport there ten years gone by, scarcely any "fichabod, thy glory hath departed." Between the ravenous jaws of the worthless pickerel, and the spiny-back of the black bass, the soft-finned trout stands a slim chance. Without natural means of antagonism or defense, the swift coming extinction of the speckled beauty is simply a question of time. With that loss the chief charm will be gone for the visitors to those waters.

E. K. WILSON.

FLY ROD FOR BLACK BASS.

April, 1876.

EDITOR FOREST AND STREAM:—

In No. 8 of FOREST AND STREAM of current volume, T. W., of Leesburg, Va., asks for a description of a fly rod for black bass fishing. Permit me to say that such a rod should be constructed upon the model and of the same material as a single-handed trout fly rod. It must, however, be longer, slightly stiffer, and consequently heavier, but should approximate in its general features, as nearly as possible, the trout fly rod.

Assuming a trout rod to be eleven feet long, and weighing from seven to nine ounces, according to the material of its construction, a black bass fly rod should be from twelve to twelve feet and three inches in length, and if formed of split bamboo, should weigh from nine to eleven ounces; or if made of ash and lancewood, should weigh from ten to twelve ounces. Split bamboo makes the handsomest and lightest rod, but a combination of ash and lancewood will prove the most serviceable, and can be furnished for at least one-half the price of the former. The rod should be made in three joints, the butt of white ash, and the tip and second joint of lancewood; it should have as true a taper and as graceful proportions as the best trout fly rod; should be very flexible and pliant, but should not be so withy or willowy as the lightest trout rods. Such a rod properly handled would be found to answer all the emergencies of fly fishing for black bass, and would be just the thing for the largest brook trout of Maine or Lake Superior. J. C. Wallis of Milwaukee, Wis., or C. F. Orvis of Manchester, Vt., make such rods, warranted to give satisfaction, and at a moderate price.

OCONOMOWOC.

—Hot alum-water is a recent suggestion as an insecticide. It will destroy red and black ants, cockroaches, chinchbugs, and all the crawling pests which infest our houses. Take two pounds of alum and dissolve it in three or four quarts of boiling water; let it stand on the fire till the alum disappears; then apply it with a brush, while nearly boiling hot, to every joint and in your closets, bedsteads, pantry shelves and the like. Brush crevices in the floor of the skirting, or mop boards, if you expect they harbor vermin.

—In India, in 1869, one tigress was reported to have killed 127 people, and stopped a public road for many weeks. In another case in the central provinces a single tigress caused the desertion of thirteen villages, and 250 square miles of country were thrown out of cultivation.

—In some parts of Russia the young shoots of the "cat-tail" (*Typha latifolia*) are used as asparagus; they are said to be delicious. The plant grows abundantly in the United States in swampy localities.

Yachting and Boating.

All communications from Secretaries and friends should be mailed no later than Monday in each week.

THE ENGLISH UNIVERSITY RACE.—The greatest event in the English rowing year, an event which is exceeded in interest and the numbers attracted to witness its result only by the Derby at Epsom, was rowed on the Thames between Putney and Mortlake on Saturday last, the victory won by the Cambridge crew having been foreshadowed by the betting in their favor for some days previous. Before the start, Oxford won the toss for choice of positions, and as is usual on like occasions, chose the Middlesex side of the river. Shortly after two o'clock a start was effected, Cambridge getting away first with a stroke of 37 to the minute, Oxford commencing with 35. Cambridge drew closer in the first quarter of a mile, but Oxford, making a spurt, soon diminished the lead to a quarter of a length. Both crews then quickened, Oxford rowing 40 strokes to 39 of Cambridge. At Hammersmith Bridge, one mile and five furlongs from the start, which was reached in 8 min. 31s., Cambridge was again a clear length ahead, which was increased to two lengths at Chiswick Church. Here Cambridge took her opponent's water, and the race was virtually over. At Barnes' Bridge, three miles and a half from the start, which was reached in 16min. 48s., Oxford spurted a 40 stroke, but Cambridge was three lengths ahead, and the two boats kept about the same relative positions until the finish was reached, Cambridge winning by a little over three lengths. The total distance was about four miles and one furlong, and the time 20min. 19s. The Oxford crew, it is said, did even better than their friends expected of them, although their steering was faulty. Cambridge, however, had decidedly the best crew that has been out for several years past.

The first of these inter-collegiate races was rowed in 1829, since when the rival crews have met thirty-three times, Oxford having seventeen victories to her credit and Cambridge sixteen. For a long series of years, ranging from 1861 to 1869, Oxford was invincible, her crew winning on every occasion. In 1870, however, Cambridge broke the charm, and for the three following years was also victorious. Last year Oxford won. The fastest time over the course was in 1873, when Cambridge won in 19 min. 35s., this being the first year that sliding seats were used by both crews. It is reported that a portion, at least, of the winning crew of eight will visit this country next summer.

CENTENNIAL NOTES.

PHILADELPHIA, April 10th, 1876.

EDITOR FOREST AND STREAM:—

The return of spring has brought a return of boating men to the river. The first event of the season here will be the Local Regatta, ordered by the Naval Board for June. The date has not yet been fixed. The interest, however, in this regatta is not at all intense. The men here willing to row races are not at all willing to remain during this Centennial season, in training. Training from, say May to September, seems to be a terror to our rowing men. We do not seem to realize that a race can not be won except by hard work, and men who like Mrs. Dombey, are not willing to make an effort, do not desire to win. The Quaker City having won the four-oared flag last year, must of course enter, but further the deponent, neither can nor does say.

Though the interest in the Local Regatta is "plentifully lacking," the work in the Centennial Regatta does not lag. The committee are carefully considering every question that comes before them, and the questions are not few. That crews from Cambridge and Dublin will be here, there is no doubt. That the London, Leander, and Kingston rowing clubs will come, is probable, or that two of them will come is almost assured. Oxford was even doubtful before last Saturday, and now there is little chance of having them here. The American colleges are very anxious to have an international college race, but Saratoga's inducements have a great attraction for students. Philadelphia has no further inducements to offer anybody, than a hearty welcome and a fair race.

SCULL.

Since the above was written the British Commission has informed Commodore Ferguson that it has received information by cable to the effect that at least four "fours" from England and probably an "eight" will enter in the Centennial matches.

PEORIA BOAT CLUB.—We have now organized here a first-class boat club. We have some of the finest boats built that the country can afford. Have been in existence about one year. Have $1,200 in five boats. Have good material to work with, and one of the finest three and a half mile course you could imagine, being a widening of the Illinois river, just in front of our city, with a splendid view north and south of as beautiful sheet of water, three quarters of a miles wide at all seasons of the year as can be imagined. We expect the Chicago and St. Louis clubs will meet here this season and battle with ours to their hearts content, sometime during the season. P. C. W.

—The Halifax crew which is to compete in the regatta at Philadelphia have commenced training. Their names are as follows: John C. Vickerson, Caleb Vickerson, Abadiah Smith, Warren Smith, and Richard Fleming. The boats are ordered from England.

—The Rockaway Yacht Club has filed a certificate of incorporation in the County Clerks office. Alfred Neilson, Daniel Lord, Jr., William Lummis, and Alexander H. Stephens will act as trustees of the club, which will have its headquarters in this city.

—The first yacht to go into the water this season at Lynn, Mass., was the Gemsbock, belonging to John Smith. She was built by Levi Alexander.

THE "AMERICA" CUP.—Mr. C. A. Minton, Secretary of the New York Yacht Club, is in receipt of a letter from Mr. Chas. Gifford, Vice Commodore of the Royal Canadian Yacht Club, challenging the New York Yacht Club for possession of the America's cup (or "Queen's cup," as it is usually termed,) provided the latter club consent to waive the six months notice. The Countess of Dufferin, schooner yacht, is named as the challenging vessel.

We presume that the Countess of Dufferin is the new yacht now building at Coburg, Canada, under direction of Capt. Cuthbert, the well-known yachtsman. We trust that the New York Club will consent to waive the six months notice, and that the match may be sailed over our outside course during the summer.

SOUTH BOSTON YACHT CLUB.—The annual meeting of the South Boston Yacht Club was held Wednesday evening, 5th inst. The annual report of the treasurer was submitted and showed that the receipts for the year were $695, and the expenditures $687. The secretary reported that the total membership was 136, an increase of 17 over last year. The club has lost 12 members during the year, two of them by death. The yachts owned by the members number 54. The club voted to keep the club house where it now stands.

The officers for the ensuing year were duly elected as follows: Commodore, James H. Stark; Vice Commodore, John Charnock; Fleet Captain, E. W. Sears; Recording Secretary, Wm. Morris; Financial Secretary, E. H. Maloney; Treasurer, Thomas Christian; Measurer, J. Winniatt; Trustees, Fred S. Wright, P. P. McDonald, J. G. Chambers.

On Thursday evening the 6th inst, the members of the club, with their ladies, indulged in their last dancing party of the season at the club house.

DORCHESTER YACHT CLUB.—The annual meeting of the Dorchester Yacht Club was held last week at the club house at Commercial Point, Boston. Commodore Bangs presided. The report of the secretary showed that the total membership at present is ninety-four, and the number of yachts belonging to the club sixty-four.

The following officers were elected for the ensuing year. Commodore, W. H. Bangs, Jr.; Vice Commodore, Nathaniel Wales; Fleet Captain, Henry S. Mann; Secretary and Treasurer, Frank W. Weston; Measurer, W. W. Lewis; Trustees, C. E. Folsom, William T. Adams, and W. H. L. Smith; Regatta Committee, W. H. Bangs, Jr., Coolidge Barnard, Nathaniel Wales, W. H. L. Smith, and Henry S. Mann.

A motion to amend the rules was made by Capt. W. A. Nickerson, so as to forbid the shifting of ballast in first-class keel and centre-board yachts. This was refused, and yachts of all classes will be at liberty this year, as last, to exercise their discretion in this matter.

QUINCY YACHT CLUB.—This club held its annual meeting in the Lyceum room, Town Hall, Quincy, Mass., Saturday evening, 1st inst, and elected the following officers for the ensuing year: Commodore, James H. Slade; Vice Commodore, Secretary, and Treasurer, H. A. Keith; Regatta Committee, J. H. Slade, E. B. Souther, Joshua Binney, James T. Penniman and George Morton. The appointment of the Committee on Membership was left in the hands of the Commodore and Vice Commodore.

The Regatta Committee were instructed to prepare forthwith a programme of races, etc., for the ensuing season. The sailing regulations were amended so as to allow the yachts of the first and second classes to carry any sails except square sails, while those of the third and fourth classes are restricted to their working sails, which, in the case of sloops, includes a gaff topsail. Yachts are also to be allowed to shift ballast to windward.

After partaking of an excellent supper at the invitation of Commodore Slade, the prizes won at the three champion races last season were distributed, consisting of gold-lined silver goblets to the Nettie, Red Lion, Mabel, Annie, Tulip, and Flora; and handsome silver vases to the Jennie, Lightfoot, Lena, India, and Secret.

The Rifle.

NATIONAL RIFLE ASSOCIATION.—The Board of Directors of the National Rifle Association held its monthly meeting on Wednesday last, Gen. Shaler in the chair. The Secretary reported the receipt of a letter from the Secretary of the National Rifle Club of Scotland, accepting the invitation of the National Rifle Association to visit this country during the occurrence of the Centennial matches; also that 2,000 copies of the annual report of the association had been printed at an expense of $565, which would be fully covered by the receipts for advertisements in the report; 500 additional copies of the new rules of the association and the programme for the spring meeting had been issued; Company I, Seventh Regiment, and the Washington Grey Troop Cavalry had affiliated with the association; the Amateur and Seventh Regiment Rifle Clubs had announced that they would commence their monthly competitions at Creedmoor during the present month. The *Spirit of the Times* has presented the association with a solid gold medal, to be competed for upon the following conditions:—Open to all members of the association; distance, 200 yards; position, standing; any rifle; two sighting and ten scoring shots. The report of the Treasurer showed a balance on hand of $979 57. The Range Committee was authorized to erect a target after a model prepared by Major Jewell, and another as designed by Mr. E. H. Sanford, the expense in either case not to exceed $100. Paragraph 6 of rule 2 of the regulations of the association was amended to read as follows:—

"In all competitions confined to the use of breech-loading rifles, the guns shall be loaded at the breech with fixed ammunition."

The Secretary read an invitation from the "Sharpshooters' Union of the United States" to the National Rifle Association and affiliating clubs, to attend its shooting festival at Philadelphia from June 26th to July 3d. The Committee on Rooms reported in favor of securing new headquarters at No. 23 Park Row. The action of the committee was approved, and the Secretary and Treasurer were directed to obtain new furniture for the apartments. The rooms are on the first floor of the building, and are much larger than those at present occupied by the association.

AMATEUR RIFLE CLUB.—The annual meeting of this club was held on Wednesday last, and the following officers elected to serve for the ensuing year.—President, Col. C. B. Mitchell; Vice President, Robert Johnston; Secretary, George S. Schermerhorn, Jr.; Treasurer, A. Alford; Executive Committee, George Crouch, Col. W. B. Farwell, G. W. Yale, E. H. Sanford, and Major Joseph Holland. The Secretary reported the number of members enrolled to be 178, comprising all the long-range shots of America. The Secretary referred in complimentary terms to the success of the International teams. The proposition to erect a new club house at Creedmoor was referred to the Executive Committee with instructions to prepare plans and specifications for the construction of the required building. On motion of Col. Wingate, it was decided to present medals valued at $25 each to the team which represented the club in the American-Canadian match.

—A canvas target has been erected at Creedmoor, and tried successfully. The greatest objection to them appears to be in the fact that there is less check on the marker, as with the iron targets a good glass can make out the shots.

CREEDMOOR, JR.—A match between teams representing the Sophomore Class of Columbia College and the New York Life Insurance Company, was contested at this range on Friday last, resulting in favor of the college team. Following are the scores.—

Lloyd Roberts, Captain	3 3 3 4 4 2 4 4 4 4	35
W. H. Racey	2 4 4 3 3 4 4 4 2	34
F. M. Parker	4 3 0 4 2 3 4 4 4 5	33
Grand total		223

NEW JERSEY.—A practice shooting took place at Schnetzen Park, Union Hill, N. J., April 5th, which was very well attended. The following gentlemen made the highest scores in ten shots, at 200 yards;—W. Scholermann, 18 rings; W. Klein, 167; Ph. Klein, 163; R. Faber, 162; C. Doehle, 147; J. Blumenberg, 146; J. Bergmann, 146; A. Hellwig, 145, John Raschen, 140. Mr. Robert Faber, of New York, made the most (ten) four inch bullseyes. The next and last practice shooting for the winter season will take place April 19th, shooting to begin at one P. M.

CHICAGO.—There was a meeting at Chicago on the 1st of the month of delegates from the various clubs of the northwest for the purpose of organizing a Northwestern Rifle Association. One day was passed at the range of the Chicago Club in a series of informal contests, the following being some of the scores made:—

At 200 yards; five shots each—Possible 25.

Name and Place	Total.	Name and Place	Total
Sketch, Milwaukee	16	Col. Shaffer, Chicago	
Bangs, Milwaukee	19	Plum, of Streator, Ill	
Smith, Milwaukee	19	Barnham, Chicago	
Wells, Milwaukee	17	Turner, Milwaukee	
Fielding, Milwaukee	18	Blackmer, Chicago	
Fuller, Chicago	13	Fairchilds, Marinette	

At 500 yards—Possible 35.

Name and Place.	Total.	Name and Place.	Total
Sketch, Milwaukee	28	Col. Shaffer, Chicago	
Bangs, Milwaukee	35	Plum, of Streator, Ill	
Smith, Milwaukee	23	Burnham, Chicago	
Wells, Milwaukee	33	Turner, Milwaukee	
Fielding, Milwaukee	32	Blackmer, Chicago	
Fuller, Chicago	35	Fairchilds, Marinette	

CALIFORNIA.—The return match at 200 yards between teams of three each of the National and Union Rifle Clubs of San Francisco was shot on the 26th ult., and again resulted in a victory for the former by the following score of four strings of ten shots each:—National Team—Le Boutillier, 40, 39, 38, 38; total, 155; Nash, 42, 42, 42, 44, 35; total, 163; Burgess, 38, 43, 39, 42; total, 162; grand total, 480. Union Team—Wright, 39, 42, 43, 44; total, 168; Harris, 37, 30, 28, 38; total, 128; Willett, 38, 40, 40, 44; total, 162; grand total, 458. At the conclusion of this match, another was shot, the result of a challenge from Jeff Pascoe to Mr. B. Hentz, the conditions being the same, viz: four strings of ten shots each at 200 yards. The following were the scores:—Pascoe, 32, 37, 40, 37; total, 146. Hentz, 39, 39, 39, 39; total 155. Three members of the Union Guards having made a wager regarding beating the best score made above, shot a similar number of rounds with the following result:—Charles L. Lods, 43, 41, 38, 40; total, 162. R. M. Thomas, 42, 39, 39, 31; total, 151. J. McDermott, 30, 38, 42, 35; total, 145.

The members of the California Schentzen Club are preparing a team to visit Philadelphia in June and July. A meeting of the California Rifle Association had been called for the 8th instant to consider the question of California representation in the contest for places on the American team in the forthcoming Centennial International Rifle Match; also to devise means for furthering any scheme to secure such representation

MILWAUKEE RIFLE CLUB.

MILWAUKEE, April 3d, 1876.

EDITOR FOREST AND STREAM:—

The Milwaukee Rifle Club had their first shoot for the Brudhend field-glass prize, at 200 yards last Saturday. John Mennier made the best score, and claims to have won the glass once. There is, however, a general dissatisfaction among the members of the club about John's style of shooting and the kind of gun he uses, and at the club meeting to-night he may be ruled out of this score, or at least barred from shooting again in the same position. When he shoots he rests his left elbow on his left hip and leans backward bringing the whole of his arm from the elbow to the shoulder against his body. He is a gunsmith himself, and has built a gun especially designed to suit his position for 200-yard shooting. The gun has a short barrel and a crooked stock, with hollow butt plate to fit the shoulder like a German target rifle. He is the crack shot among the German sharpshooters, and is used to that position and style of rifle. With the Creedmoor rifle, which all the rest of the club use, he cannot do any better shooting than several others, but with this gun he can win every time.

Possible 50.

Name.	Total.	Name.	Total.
John Mennler	45	T. N. Hawley	35
E. Fielding	39	C. Turner	36
C. N. Smith	39	C. Simonds	34

WAD WAD.

[If the little finger of the left hand is in front of the trigger guard, the position of Mr. Mennier is allowable according to the rules of the National Rifle Associatiou.—ED.]

NEW ORLEANS RIFLE CLUB.

NEW ORLEANS, La., April 3, 1876.

EDITOR FOREST AND STREAM:—

In consequence of a light rain in the morning, the weather yesterday was very unfavorable for rifle shooting. The light being very changeable. The members notwithstanding were out in full force and made some very good scores. The contract for the erection of our house on the new grounds, has been given out, some of the buildings are already up, and I hope to be able to send you some fine scores soon, made on the long range targets. The following are the leading scores yesterday: 200 yards at rest, Wimbledon target: R. G. Eyrich, scored 95 out of a possible 95; Dr. C. Beard, scored 74 out of a possible 75; P. Mallard, Jr., scored 70 out of a possible 75; J. M. Conway, scored 70 out of a possible 75. 200 yards off hand, Wimbledon target, Jules Pifaut, scored 63 out of a possible 75; L. A. Jung, scored 61 out of a possible 75; Dr. C. Beard, scored 20 out of a possible 25; P. Mallard, Jr., scored 20 out of a possible 25; A. M. Leambias, scored 20 out of a possible 25. 25 half inch ring target, Dr. C. Beard, scored 219 out of a possible 250; R. G. Eyrich, scored 216 out of a possible 250. Off-hand cartoon target, E. J. Wenck, first prize for best cartoon; C. Kressner, second prize for best cartoon; Geo. Muller, third prize for best cartoon; E. J. Wenck, premium for most cartoons. GUSSIE.

—Major Leech, who is to be Captain of the Irish team visiting this country next summer, has subscribed the handsome sum of £500 sterling toward the expenses of the team. The *Irish Times*, in alluding to the visit of the Irish riflemen, says:—

"We are glad for the credit of Ireland that Major Leech has been prevailed upon to become again the chief head of the Irish rifle team. He has had great experience as the Captain of the Irish Rifle Association. He is indefatigable in working out anything he once undertakes to do, and his powers of orgauization, and what is no less valuable, of control, are unequalled. The Centenary Exhibition will open next June, and the Irish team will probably not depart until the latter end of August or beginning of September. Meauwhile, the men must practice perseveringly, for the Americans will certainly not surrender the honor they won without a determined struggle. As Major Leech says, 'we have the right men, and, from communications I have had with them, we mean to work.' To this we shall merely add that the men have the right leader, too."

For Forest and Stream.

THE HUNTER'S HORSE.

IN No. 7 of the current volume of FOREST AND STREAM, Mr. J. H. Batty mentions a mule that appeared entirely indifferent to the smell of blood. This is in marked contrast with a mule which a friend of mine was riding in the "Nation" when he found and killed a deer with his army pistol. Being about four miles from the ranche, he took off the saddle and disengaged the "tie-strap," (a strap of leather about four feet long used for tieing, instead of buckling on the saddle,), tied it around the deer's horns, and then to the mule's tail. About this time the mule, looking around, took fright, and ran all the way to the ranche with the deer, and left Bill to walk and carry his saddle. Bill swore that that was the first huckskin he ever saw dressed on the deer. I knew a Texas pony so wild when it was broken that it bawled like a cow in distress. After bucking for some time and not being able to get rid of its rider, it plunged backward flat on its back (the rider, apprehending this trick, dexterously sprung from the saddle), with such force as to crush the saddle tree. It was not a great while after this that I saw this same pony actually lick the blood from a recently killed deer. I use a medium-sized pony-horse (Fox) for most all my hunting except wing shooting. I never have seen a horse as little concerned about gunpowder. If I have occasion to dismount and hunt in haste, he will grass around the place I leave him for half a day. I brought an American horse from the States to Texas that seemed to be constitutionally so nervous that it was an impossibility for him to stand fire. He would stand and tremble till the gun fired, and then he would bound. My observations have been that good "hunter's horses" are scarce, even in Texas, and the sportsman who has a good one may well be proud of it.

TEXAS.

A HUNT SPOILED.—Three Syracuse sportsmen recently purchased a live rabbit of a country trapper, and, borrowing a couple of hounds, repaired to the "rural districts" to indulge in a little coursing. Arriving at their destination, they prepared the dogs, and dropped out of the bag a *dead rabbit!* Three men never talked more "bad talk" than did these sports, as they tramped their weary way to the "city of salt." SENECA.

For Forest and Stream.

OUR VIGNETTE.

I REGARD your vignette, as well as your paper, as eminently a success; and admire and enjoy it beyond anything of the kind I remember to have seen, so suggestive is it at all points of forest and stream pleasures; of mountains and rocks, lakes and rills, deer and trout, sail-boats and row-boats, tents and kettles, and all the paraphernalia of hunting and fishing. Your very name is formed of wild branches, around which clambers a vine; and your gentlemanly sportsmen, founded on a rock, sit quietly under them with no one to molest. I am happy to miss the flask, as not wanted to promote enjoyment of the peaceful scene. But there is another characteristic of the picture on which I would enlarge. I observe that though two beautiful deer are represented within shooting distance, the hunter and his dog look the other way; if not to the fishing line, at all events to the line of fishing; while the fisherman surveys the lovely creatures, apparently without the disposition or the thought of harming them. Yes, the very dog reclines as in millenial rest; the hunter averts his face from what might otherwise be his victims, yet there stands a buck looking him square in the face, and a doe browsing, or drinking of the "laughing water." I would be glad to accept this as auspicious and prophetic of the future. I observe another thing: The ghost, or trunkless head of a gone moose, who appears to be situated between the two horns of a dilemma.

Thoa mind'st me of departed joys,
Departed never to return.

Now, who would have those deer in the situation of that moose? Who would have nothing left but their portrait to gaze on, instead of meeting them at every turn in the woods, and beholding and admiring their living beauty? I cannot flatter myself that by anything said I can save the life of a single deer; but am willing to say, as under the protection of your vignette, I wish I could. I enjoy far more to see them living than to see them dead. They are "ornaments to society" in their native wilds, but dead, the glory is departed. I would rather try my skill as a marksman on smaller game. But men in the woods need venison. Then I hope they will always have it; and to this end save the deer. If they *need* venison by all means let them get it if they can. But I would say with Portia in such a case. "Take then thy pound of flesh;" take nothing more.

In the hope that you and your readers, and our deer friends in the mountains may always have a good time of it in the woods, and your readers out of it as well, I remain. AMATEUR.

Utica, New York.

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

The "Subscriber" who finds fault with our not noticing his query will find an explanation by referring to the single line at the head of this column.

N. C., JR., Jersey City.—Will you please inform me where I can procure Wingate's Rifle Manual, and the cost postpaid. Ans. We can send it; cost, $1.50

S. GREEN, Milwaukee, Wis.—Please give me the address of some trustworthy dealer in aparatus for collecting insects, etc. Ans. S. E. Caseino, Salem, Mass.

J. M. H., Pittsburgh.—Can you tell me if I could get a young hitch out of Dick at a reasonable price? Answer in your paper. Ans. Address W. Jarvis, Esq., Claremont, N. H.

E. A., Pomfort Centre.—What is the so-called blue Belton setter. Is it black, roan, or really a blue color? Ans. We have a brace which are blue. Some are black, tan, and white, some black and white.

P. P. P., Baltimore.—I have an imported pointer, now about five years old, who seems to be afflicted with a great difficulty in urinating. Ans. Give tea made of parsley leaves, as much as he will take.

W. A. J., Elizabeth, N. J.—Will you please inform me through your paper where I can purchase a Barnegat cneek boat? Ans. Address Joel Ridgeway at Barnegat Village, Ocean county, where they are made; price $45.

A. G. J., Pittsburgh.—1. Is there good fishing in Lake Simcoe, Ont., and its tributaries. 2. When is the best time to go, and the best point to stop at, and with whom can reasonably good accommodations be had? Ans. 1. Good bass fishing. 2. Go in July; stop at Canchicbin Hotel.

C. R., New York.—Can you inform me where to get a good retriever for ducks, snipe, etc., well broken, under three years' old. A reply in answer to correspondents will oblige. Ans. Mr. J. H. Whitman, of Chicago, is a large breeder of water spaniels, and possibly could supply you.

H. T. H., Morristown, N. J.—What book on the subject of trout hatching and culture would you recommend one buying to study up on; the price and where it may be obtained. Ans. "Domesticated Trout," by Livingston Stone, $2.50. We can send you a copy. The book contains a list of all works extant on fish culture.

TROUT, Greene, N. Y.—Please inform us in what part of Pennsylvania a party of three will find the best trout fishing, say about May 10th. Ans. Go to Bloomiag Grove Park House, Pike Co., Pa. *via* Erie R. R. to Lackawaxen, on to Trout Run, Lycoming Co., 15 miles from Williamsport, on Northern Central. Ralston is a good point.

A. G. M., Lexington, Ky.—I received a circular from Green Lake, Wisconsin, and would request of you to give me all the information as regards the fishing and hunting there in May, and the best point to get good accommodations. How is the Oakwood Hotel? Ans. See FOREST AND STREAM, Vol. IV., Nos. 24 and 25, July 22 and 29. 1875. Two columns of information is all.

SUBSCRIBER, Sandy Hill, N. Y.—Will you inform me of some speedy cure for poison ivy or sumach. I am fearfully poisoned by this growth, and would like to know what your remedies are. Ans. The very best remedy is to apply water as hot as can be borne to the part affected. Had you complied with our rule regarding anonymous communications we would have replied to your question by mail.

C. B. C., Boston.—1. What is the cost of a good "field glass?" 2. Can I get an opera glass that is as powerful as a field glass? I want it to keep score on target, distance, says 800 yards. Ans. 1. From $25 to $75. 2. Yes, but it will cost about the same. A binocular field glass on the same principal as an accromatic spy glass will cost $75. An ordinary good field glass, $25; a brass telescope mounted, $85.

P. W. K., Phila.—Would like to have some fishing amongst yellow perch. Can you tell me where in this neighborhood I could get it, also the close time; likewise the nearest black bass fishing. Ans. Lambertville on the Delaware is spoken of as a fine place for yellow perch, and Paulin's Bridge, Perkiomen Station, 25 miles from Philadelphia, on the Reading R. R., for bass. Both are apt to be found together.

W. J. T., Reading.—I have a pair of young imported pointer pups six months old, who do not seem to grow as they should; one of them has distemper now, the other had it and is over it. I have fed them with worm medicine, but it does not seem to have the desired effect. Ans. We will mail to you a remedy for worms—and in our kennel column you will find an excellent remedy for distemper by Dr. Webb, as practised by him with Whisky and other drugs.

SHOT, Hayward, Minn.—1. Which material do you think is the best for gun barrels, laminated or Damascus steel, and why? 2. Was there ever a breed of orange and white setters that bred true to color, that you know of? 1. Damascus is the most expensive and makes the handsomest barrel, but laminated is as strong and servicable, if not more so. 2. The Morford setters, of which Spipman's Joe is about the best representive, are orange and white and breed true to color.

TERRAPIN, Oxford.—Would you be kind enough to inform me about terrapins? Would it pay to catch a large lot of them in a pen in the summer when they are easy to catch. How much are they worth a dozen, and are they ready sale? Ans. Yes; if you have a suitable place it would pay to catch and pen them, or even to buy them when cheap. They are worth $12 per dozen at retail, but for all information on this point write to Mr. E. G. Blackford, Fulton Market, this city.

OLD SUBSCRIBER, Washington, D. C.—Can you advise me through the columns of your most excellent paper, whether or not there has ever been published a manual or guide on sailing and general management of small pleasure boats? Ans. None in this country, although such a book is much needed. Vaaderdeckens' "Yacht Sailor," an English work, is the nearest approach, but it applies to English modes of rigging only. On page 3 of Vol. 5, will be found some capital rules for handling small yachts.

READER.—I have a splendid pup eight weeks old, and found out lately that he had worms. I have been giving him a good deal of grease with his food, and wish to know if this could be the cause of his trouble. Please give some general directions concerning the best food for dogs? Ans. We do not think that feeding your dog much grease would produce worms, yet a continuation of it would probably produce other diseases. There is no better food than the scraps from the table, bread, meat, gravy, and vegetables. Aroca nut is the best known remedy for worms.

HOLLIDAY, Philadelphia.—I have an invitation to spend a few weeks at Ocean Grove, Monmouth County, N. J. This place is a few miles south of Long Branch, and about 1½ miles from Shark River and Inlet. Is there any fishing or shooting there now in this month? Is there sport in that neighborhood at any time? Would you advise a trip now? Is there any law against shooting by non-residents without license? Ans. You would probably find both snipe and ducks now. During the summer there is, or should be, good fishing for weak-fish and blue-fish. No license is required from non-residents in that county.

IGNORAMUS, Brooklyn.—1. Can you tell me what is the price of Sharps new long range rifle, advertised in your paper? Will it burt a pinfire breech-loading shot gun to shoot balls in it? 3. What is the price of Hazard's powder, that comes in 6½ lb. cans? 4. Where can I procure a book of game laws, and what would be the price of such? Ans. 1. $80, $105, $125, according to finish; the shooting qualities of all are the same. 2. No, if it is not choke-bore. 3. $3.55. 3. Suydam's "Fur, Fin, and Feather," contains all the game laws. A new edition will be issued shortly and will contain the latest amendments; price 50 cents.

R. L. G., Louisville, Ga.—1. I have a Scott gun, 10 shell, 32 barrel, 11-gauge at muzzle, good at 75 yards. Will a "Greener" choke-bore beat this? 2. What is the difference between the gauge at muzzle and at breech of a choke-bore? 3. I have another breech-loader 32-in barrel, 13-gauge at the muzzle, shoots a 12 shell. Are either of these choke-bore? Ans. 1. If you send us the pattern of your gun at 75 yards we can then judge as to whether a Greener choke-bore will beat it. 2. The same as in any breech-loader. 3. We cannot tell; all breech-loaders are a size larger in the chamber than at the muzzle, to admit the shell.

AMATEUR.—1. Can you give your readers what are considered "points" for the Bench Show to be held at Springfield? The notice sent out says the average number of "points" shall decide, but does not give any idea of what are standard points, &c.? 2. What does a "gyp" mean? Is there any objection to naming either a dog or a bitch gyp? Ans. 1. The mode of judging at Springfield is by making the maxima figure of merits 100 points, made up by so many for head, so many for coat, color, etc. What these different figures are we do not know, although we wrote to Springfield to ascertain. 2. Gyp, is the term sometimes used for bitch. We should prefer to give a dog some other name.

JOYCE, New York.—1. What do you think of Boudeau's Jack Lamp for night hunting and fishing, does it not give too much light for deer. 2. What kind of flies are used for trout fishing in July. 3. How are gang hook made for lake trout. Do the hooks want to be fastened to wire string or to copper wire. 4. Are brass shells better than paper for shot gun. Ans. 1. A most excellent lamp, highly spoken of. 2. Red fly, grizzly king, blue professor, coachman gray palmer, green of the water, etc. 3. Bend your hooks on coarse wire gimp, in three gangs of three hooks each, back to back, and two inches apart. You can use gut if you like. Don't omit the swivels. 4. We prefer paper, although many sportsmen use metal, particularly in duck shooting.

E. S. G., New Haven, Conn.—In a recent number of your paper, a member of your Editorial Corps reported partaking of a trout dinner the day nr the day after the opening of the season for taking trout in your State, and in speaking of the relative qualities of the fish partaken of upon said occasion from different sections, mentions some from New Haven, Conn. As our close season continues until April 15th, I would like to ask if he can vouch for his statement? Ans. Yes; the trout mentioned came from your city, or at least State. If breeders or others will send their fish to our market during our open season, neither our local club or fish dealers can prevent them. It should be cared for at home. In order that there should be no mistake in this instance we have received confirmation of one original statement from Mr. Blackford.

PITCHER, Poughkeepsie, N. Y.—Will you please inform me what the "force collar" and poxzle peg" are that are spoken of in the FOREST AND STREAM of this week. Ans. The force or spike collar is made by taking a piece of leather about the proper length to go around the dog's neck, one and a quarter inches in width; drive through it a quantity of short carpet tacks, than sew a strap, furnished with buckle and ring on the outside of the first, so as to prevent the tacks from being pushed out by use. A puzzle peg is merely a piece of wood about a foot in length pointed at one end, and flattened at the other; an ordinary leather collar is nailed to the flat end, and about four inches from this end a strap or piece of cord is nailed to the two sides, leaving just sufficient space for the dog's lower jaw to be inserted with the strap lying between the canine teeth and the molars. This prevents the dog from hunting with his nose near the ground.

AMATEUR, Ct. Barrington.—1. I have a breech-loading Wesley gun, 12 bore, 30 inches, 7 10-16 lbs. How large a charge of powder and shot can I safely use for ducks at long range? 2. How can I tell whether the gun is choke bored or not? 3. What are "chilled shot;" will they do better shooting than ordioary shot, and if so, why? 4. What is the smallest breed of bird-hunting dogs; and where obtained? Ans. 1. 4 drs. powder and 1¼ oz. shot. 2. By the pattern, or by taking it to a gun maker who can tell by measuring the inside of the barrels at different distances. 3. Shot made hard by the addition of antimony, etc.; they give better results in choke bores, for the reason that they retain their shape. Better penetration is said to be gained by them in cylinder bored guns, but at the expense of pattern. 4. Cocker spaniels. They were imported from England, but are now bred extensively in this country by many gentlemen, among whom we might mention Mr. M. P. McKeon, of Franklin, N. Y.; Mr. J. Bestor, of New Haven, and, we believe, Mr. Munson, of St. Louis.

FOREST AND STREAM

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCULCATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
(POST OFFICE BOX 2832.)
123 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty-five per cent. allowed for five copies and upwards.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent.; over six months, 30 per cent.

NEW YORK, THURSDAY, APRIL 13, 1876.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Editor.

WILLIAM C. HARRIS, Business Manager.

A SCOTTISH CONCERT.—The gallant 79th Highlanders give a concert this evening at Steinway Hall. We observe from the programme that our fair correspondent Mrs. Jennie Young, takes a prominent part, singing many of those delightful thrilling old Scottish airs, such as "Jack O'Hazeldean" and others. A well qualified critic, Mr. Milford of the British Consulate has declared Mrs. Jennie Young's descriptions of Scottish games which have at various times appeared in our paper, as the most correct and graphic of any which have been published in this country.

—Col. J. B. Oliver, our General Agent and Correspondent for the South and Southwest, put in an appearance at our office yesterday, with a look as genial and energetic as the lively city to which he belongs—Jacksonville, Fla. A prominent Florida paper, making recent personal mention of this gentleman, says: "He is worth his weight in gold in any enterprise that engages him." We are pleased to welcome Colonel Oliver to our great metropolis.

WATER-PROOFING.—If there is one boon greater to the sportsmen than another it is the possession of an outfit and appurtenances that shall be perfectly water-proof and impervious. Any careful reader of our columns of Answers to Correspondents will have noticed that among the more numerous of inquiries is the one relating to water-proof tents and canvas coverings for boats: It is with pleasure that we call attention to the advertisement of Mr. C. Tappan, who, having discovered and patented a method of water-proofing which appears infallible, has made arrangements with manufacturers in Philadelphia, Baltimore, Boston, and New York to receive orders for goods, such as tents, boat covers, awnings, suits, etc., to be water-proofed by his process. We have seen a boat cover prepared after this formula, which, after five years of service, was as impervious and as free free from mildew as when new. The fishing lines now sold by Messrs. Bradford & Anthony of Boston, are water-proofed under Mr. Tappan's process, and have been found to be stronger and proof against mildew and rot, the texture being thoroughly impregnated with the preparation. For salt water fishing it is invaluable, as a good linen line will last for years without being in danger of giving out at a critical moment.

EDITORIAL NOTES OF SOUTHERN RAMBLINGS.—No. II.

WE believe in the "eternal fitness of things." The year has its various seasons, and each season its peculiar attractions. All the good gifts of life, all its sports and pleasures, are so wisely apportioned and adjusted as to harmonize not only with the recurring seasons, but with our changing moods and desires. Strawberries and watermelons are enjoyed most in midsummer; the jingle of sleighbells would lose half their charm under a tropical sun; flowers look dreary in winter, and the voice of the song bird is mournful. Even the full December moon wakes no emotions in the lover's breast. A blazing wood fire on the open hearth is twice as potent. By like economy of nature it is ordained that the summer shall be the season for fishing, and the winter for hunting. In hot weather violent exercise brings lassitude, but in winter health and vigor. Wherefore the indolent pursuit of the angler is a more congenial pastime under a July sun than a sweltering tramp after woodcock. Wherefore, also, the frosts of October, and the "smell of the field," stimulate the hunter to take to the woods. In welling contemplation of the crisp and rustling leaf and the golden hues of autumn, he is seized with a "mania akin to that of a wild turkey hatched under domestic influences." (A valued correspondent has furnished us with this simile, and we give him due credit). When the hazy dreamy days of Indian summer come, and the leaves rustle, and the beechnuts and acorns begin rattling down, an instinctive desire comes upon the gobbler for the woods! He mounts the restrictive fence and drops over into the adjoining copse. The trembling leaves and rattling mast bring back his wonted nature. He feels that "his foot is on his native heath." He gives one gobble, and is *gone!*

Instinctive desires exist in man. Nature demands rotation, for rotation is rest. The birds migrate to the south and return periodically, and the hunter may elect to follow them in their going and returning; but he will not only find himself enervated by his labor under the southern sun, but cloyed by too much sport—pampered by inordinate indulgence, so that when the northern sport begins, all zest is gone, and "the how to amuse himself" becomes a bore. Too much sport is like too much prog; it cloys and stupefies. I do not speak for every one, but I have always found it so in my own case. As the year is divided into summer and winter, so the sportsman's cycle is divided between hunting and fishing, and I think the angling rod becomes much more a thing of beauty and a joy, after having been laid aside for six months, than if it had been in constant service a and companion to the gun everlastingly. I do not mean to inveigh against the delectable land of Florida, or against the practice of going there for a winter's sport. I am only describing my own feelings after a two months' vacation, and I cannot but think that the business man who labors not too assiduously throughout the winter, enjoys with a keener relish the early spring vacation beside the stream than he who, having no employment, is constantly seeking fresh fields and pastures new, restive and unsatisfied wherever he goes, and happy only in the novelty of new situations. The gun and rifle should be laid aside by the 1st of February at the very latest, and from that time until April at least, (May is better), should follow an interval of hard work and earnest application to duties that dignify and enrich. Then take down the rods and landing nets!

Hunting at the extreme south is quite a different business from hunting in the northern States; for the character of the country is different throughout, as are also most of its products, animal and vegetable. Looked at from a sportsman's standpoint, with a view to determine eligible localities for hunting, the section in question is divided, physically, into dry pine land, swamp, canebrake, and prairie, with marsh and keys on the sea coast.

Swamp, so designated, is an aggregation of huge cypresses interspersed liberally with cabbage palmettoes, magnolias, oaks, maples, ash, bays, gums, and other trees, draped with long pendant gray moss, and bedecked with mistletoe and parti-colored air plants; trumpet creepers and clinging vines run from bottom to top everywhere and interlace; while an undergrowth of cypress knees, dogwood, yellow jasmine, rhododendron, cat briars, brambles, palmetto scrub, ferns, and soggy mosses chokes up the space below; the whole luxuriant mass grows from and out of an uncertain depth of water and quagmire, and is impenetrable, except to the myriads of wild creatures, scaled, furred, and feathered, that inhabit its fastnesses undisturbed. Cattle which stray in here from the neighboring dry hammocks, that are interspersed throughout the swamp like oases, frequently get mired and die, thereby supplying meat to the panthers that abound, and a satisfying repast to the buzzards and other scavengers that gather about the remnants. While hunting in this tangle is not absolutely impracticable to the bush-rangers, herders, and crackers who were cradled and abide here, yet it can hardly be regarded as a choice resort for the sportsman in pursuit of pleasure; and inasmuch as a great portion of the South, and especially of Florida, is of this character, his field, it is obvious, is comparatively circumscribed.

Canebrakes, which often cover large areas, are even more impenetrable than the swamps. Growing, as they do, on river bottoms, and most frequently in water, the canes towering twenty feet high, stiff and bristling, scarcely six inches apart, they utterly forbid passage, except where narrow paths traverse them. These paths are numerous and intricate, and as most of them are the runways of wild animals, one is liable to meet a bear at any point; and as the bear has no space to turn in, the hunter must either face the enemy or retreat. Should the "enemy" happen to be peccaries, as in parts of Texas and Louisiana, the hunter's predicament becomes precarious in the extreme; for these tough little brutes can dash through the buts of the canes with marvelous facility; they will never run except *toward* the intruder, and their onsets are made with such pig-headed and vigorous persistency as to leave them victors of a gory field, should immediate escape be impossible. Deer habitually run through here, and a choice of stands can readily be made when the hounds are out, with excellent chances of success. Excepting these opportunities, however, the sportsman has no field whatever for sport in a canebrake, and all this kind of ground may therefore be regarded as so much more subtracted from his territorial range.

Throughout the entire section of which I write, prairies of various extent are scattered at intervals without apparent regard to geological formula. One is apt to emerge from a vast swamp into a prairie of thousands of acres, or he may ride out of a piney woods upland into one of apparently unlimited area. These prairies are comparatively dry, but, except in spots where an isolated tree or small hammock stands, or a stream runs through, are covered with "saw grass" so sharp and serrated as to lacerate a horse and cut a man's boot like a knife. One can ride down the wind with tolerable impunity, just as he can draw his fingers down the trend of a porcupine's quills; but the reverse is distress and demoralization to horse, rider, and dogs. Some hounds are so plucky that they will run a deer into a prairie, but the record of their exploits is written on their ears, which I have seen worn half away and ragged at the edges! Of course hunting here is out of the question, and therefore this additional slice must be subtracted from the sportsman's domain.

Reduced to its minimum, only the pine land and marsh are available. The latter is made accessible by intersecting creeks, which boats may traverse; and the islands and keys, especially on the Florida coast, are reached in like manner. The pine land, so called, yields also oaks and nut-woods. It is generally so clear of undergrowth that a wagon may be driven anywhere, but is interspersed with thickets, copses, small swamps, and canebrakes, which afford the best cover to deer, bear, turkeys, and quail, and to numerous animals not strictly regarded as game. Some of these places offer most favorable stalking ground for the still hunter; but in general they are far removed from civilization. There are also, since the war, many old fields and abandoned plantations, which afford delectable feeding grounds for game; but these, as well as plantations and settlements that are occupied, are generally separated by "magnificent distances."

A summary of these observations will make it obvious that a large area of the Southern tier of States is impenetrable to the sportsman, while the conditions that apply to the remainder are such as to make the use of a horse, even for ordinary requirements, quite indispensable. Consequently, hunting is almost wholly done from the saddle, excepting for coons, rabbits, squirrels, and the like, which are left to the negroes. The pine lands offer a clear run for deer, hound, and horseman, and often the hunter is able to "jump" a deer before the dogs have scarcely taken the scent; in the swamps there are sure-footed ponies, known as "tackies," which will pick their way where a man would be embarrassed. Snakes and venomous creatures abound, except in mid-winter, and the hunter, being on horseback out of their reach, is protected. Turkeys are hunted without dogs, and there are no grouse. Quails are most easily approached on horseback, and as they invariably fly into the thickets when flushed, where dogs cannot follow, pointers and setters are in small request.

All these facts are important for a Northern man to know, and will answer many natural queries which arise when one is ignorant of the locality he proposes to visit. If he desires to take dogs, the sportsman must know in advance what the character of his hunting ground is to be; if he is no rider, he must learn horsemanship to qualify him for the sport he wishes to pursue. If he prefers the sea coast, his outfit will have to be adapted to his requirements there, and the same outfit that is suitable for the east coast of Florida will not do for the Gulf of Mexico, or for the St. John's River. Of some choice localities I propose to speak in my next; also of the fluvial system and the fish of the South. HAL.

NICHOLS & LEFEVER, SYRACUSE, N. Y.—The business of manufacturing the celebrated Lefever gun has passed into the hands of a new firm, as above. In justice to Mr. Lefever it is proper to state that his connection with the firm lately manufacturing guns under his patents was confined to superintending the manufacture of the "Lefever guns," and not as a partner. Mr. Nichols is a practical sportsman and brings into the firm abundance of capital, whereby every facility is offered to fill orders on short notices. The extensive machinery and tools of the old house has been purchased, and we feel confident that the new firm will receive a full share of public patronage, for which the Lefever gun is eminently deserving.

—D. Hodgman & Co., of No. 27 Maiden Lane, have one of the most complete assortments of rubber goods for sportsmen to be found anywhere, consisting of coats, pants, boots, stockings, blankets, and camping outfits, all at bottom prices. They sell everything from a diving dress to a tube for filtering water. Our friends will do well to call on them.

GAME PROTECTION.

NEW YORK ASSOCIATION FOR THE PROTECTION OF GAME.—The monthly meeting of this association was held last night at the residence of Mr. Clinton Gilbert, No. 20 West Tenth street, Mr. Royal Phelps, President, in the chair. After the minutes of the last meeting had been read, the President said that it became his painful duty to move for the expulsion of a member. The duty was all the more painful from the fact that it was the first time in the history of their association in which it had become necessary to take this action. Mr. Phelps then read a resolution to the effect that in view of the sudden disappearance of their fellow-member, Wm. C. Barrett, and the substantiated reports of his having appropriated trust funds to his private use, it became his duty, under the sixteenth article of the constitution of the association, to move for his expulsion, which he then did. A ballot was taken on the motion, and Mr. Barrett was, by a unanimous vote, expelled from the association.

The President read the usual large number of communications from sportsmen in other States, commending the good work of the association, and asking for information with the view of establishing similar associations in their respective localities.

Mr. Linddington, chairman of the Committee on Amendments to the Game Laws, reported that he had had several interviews at Albany with Senator Kennedy and other gentlemen, and there seemed to be no doubt that, notwithstanding the organized opposition of marketmen and others, all the important amendments proposed by their association would become laws before the close of the session.

Mr. Clapp said that the Legislature had been petitioned to repeal section 4, chapter 511 of the laws of 1874, prohibiting fishing on Rockland Lake from December to April, and a counter petition had been prepared and presented by Robert J. Henderson. He thought the association should take measures to aid in preventing the repeal of the act, which protected the fish with which Rockland Lake had been stocked.

Dr. Green offered a resolution requesting the Committee on Amendments to the Game Laws to take action in the matter.

Mr. Robt. B. Roosevelt thought that each locality should take care of its own fish and game, and moved that the resolution be laid on the table, which was adopted.

Secretary Cuthbert read a number of communications forwarded to the association by Seth Green, which gave most satisfactory accounts of the success resulting from the stocking of Otsego and Canandaigua lakes with trout, proving beyond doubt that barren waters can be fruitfully stocked with fish by means of artificial propagation.

The President said that during the past month he had received a number of communications from respectable citizens, commending the organization for its praiseworthy efforts in preventing the killing and sale of fish and game during the past season, and thought the New York Association for the Protection of Game had reason to be proud of such general recognition of its labors.

After the transaction of some routine business, the meeting adjourned.—*Times, 11th instant.*

ONONDAGA COUNTY SPORTSMAN'S CLUB.—At the annual meeting of the Onondaga County Sportsman's Club, held on the 4th inst., the following were elected officers for the ensuing year: President, S. W. Sherlock; Vice President, Thomas E. Townsend; Secretary, John Steadman; Treasurer, Thomas Kimber, Jr.; Financial Secretary, R. B. Strong; Executive Committee, John Bedford, Wm. Staulnum, and Wm. Fage; Attorney, Geo. W. Gray.

—The following gentlemen have been elected by the Ontario County Sportsmen's Club to represent them in the coming State convention at Geneseo. W. J. Babcock, A. J. Lamberton, J. H. Brown, E. O. Sage, and Dr. C. E. Snider.

—At a recent meeting of the Leather Stocking Club of Oswego, the following members were elected delegates to the State convention to be held at Geneseo, in May, viz.: A. Stevenson, G. W. Lyman, F. P. Eagle, N. W. Nutting, and H. C. Tanner. They were also given power to substitute.

SMELT FISHING IN MASSACHUSETTS.—Our New Bedford correspondent, "Concha," kindly sends us a copy of the new cut from the statute book, regulating the catching and sale of smelts. We print the first and second sections. The third section relates to the duties of officers, etc. The provisions of section two are in consideration of the fact that no one fishes for smelts with a line south of Cape Cod; in fact, these fishes only run up the rivers and back with the tide:—

SECTION 1. Whoever within this Commonwealth offers for sale, or has in his possession, any smelt or smelts between the 15th day of March and the 1st day of June in each year, shall forfeit for each and every smelt so sold, offered for sale, or had in his possession, the sum of one dollar.

SECTION 2. Whoever takes or catches any smelt or smelts with a net of any kind, or in any other manner than by naturally or artificially tied hooks and hand lines, shall forfeit for each smelt so caught or taken the sum of one dollar: Provided, that nothing contained in this act shall apply to any person catching smelts in any seine or net, within the limits of Bristol, Barnstable, or Dukes counties, during the time, and in the manner, a person may lawfully fish for perch, herring, or alewives, nor to any person offering for sale, or having in his possession, smelts so caught, within those limits; and in all prosecutions under this act the burden of proof shall be upon the defendant to show that the smelt or smelts, the offering for sale, possession, or catching of which is the subject of the prosecution, were legally caught.

MASSACHUSETTS ANGLER'S ASSOCIATION.—The third annual meeting of this association was held at their rooms, 38 Washington street, Boston, Friday evening April 7th, and was one of the largest meetings yet held. The following gentlemen were elected officers for the ensuing year:—President, Dr. John P. Ordway; Vice Presidents, Hon. Thomas Talbot, John F. Mills, S. W. Hathcway, C. Warren Gordon, Charles Stanwood; Treasurer, Wm. F. Story; Recording Secretary, George B. Brown; Corresponding Secretary, Charles E. Pierce; Librarian, James A. McGee; Executive Committee, James P. Richardson, Walter M. Brackett, James Walker, Benj. P. Ware, L. Prouty; Committee on Membership, D. T. Curtis, E. Delano, H. M. Whitcristall.

Prof. Spencer F. Baird, U. S. Fish Commissioner, the Fish Commissioners of the several States, Hon. W. F. Whitcher, Fish Commissioner of Canada, and Dr. D. Humphrey Storer of Boston, were elected honorary members.

Interesting communications were read from several gentlemen, among them one from J. H. Kimball, Esq., of Bath, Me., President of the Maine State Association for Protection of Fish, congratulating them upon their success in having a law introduced in the Massachusetts Legislature for the protection of trout, in which he says:—

"We have been watching the progress of your bill with a great deal of interest, for it really was of more importance to Maine and New York than your State. The report of the committee fell like a wet blanket upon us, but we are revived and encouraged by the action of the House on Wednesday. Our close time laws would avail us but little while there was an open market for our trout in Boston all the year. The recent decision in Missouri as to the constitutionality of the prohibition of possession sections of the law have great beneficient effect."

Walter M. Brackett, the artist, presented to the association, in the name of Edwin F. Snow, Esq., a neatly framed lithograph printed in 1824, entitled "The Complete Angler," in return for which a vote of thanks was passed.

By the secretary's report it appears that eighty members have joined, ten had died or resigned during the year, and that there were now over five hundred members.

A letter from Hon. Theodore Lyman was read, informing the association that they would receive this week from the Museum of Zoology specimens of the different fish of Massachusetts, and that he would deliver a lecture upon the same before the association on Wednesday evening next. To this lecture the ladies are invited.

After adjournment the members retired to the library room, where they discussed a fine collation there in waiting for them.—*Boston Journal.*

—The annual meeting of the Rhodo Island Association for the protection of Fish and Game was held April 5th. Rev. F. H. Hemperly, the President, stated that the society has between eighty and one hundred members. Its object is to cheapen good wholesome food at a time when fish and game are difficult to obtain and preserve. Ours are said to be the best spawning beds in the country, but the use of the net has had a detrimental effect. To secure the necessary legislation the attention of the people must be called to the importance of the matter, and an illustrated course of lectures on the ways and habits of fish and birds would be a desirable means.

Officers for the ensuing year were elected as follows: President, Rev. F. H. Hemperly; Vice Presidents, Dr. P. S. Redfield, John Howe, C. M. Carpenter, C. H. Clark, C. H. Wilmarth; Secretary, L. H. Cutler; Treasurer, Charles F. Pope; Advocate, H. B. Whitman.

—A correspondent writes us that a Mr. Doyle, a resident of Beaver county, Penn., killed a few days ago eight quails out of a bevy at one shot. Fortunately the testimony to prove the fact is in the possession of the president of the Enon Valley Sportsmen's Club who will see that this violator of the law is properly punished. Certainly we have not heard for a long time of such a flagrant and unsportsmanlike action.

STUMP PULLING.—There are few farmers but who have had a fight with some obstinate stump, and the man who travels with the patent stump-puller is almost as familiar a character in the rural districts as the peripatetic lightning-rod man, or the ubiquitous book canvasser. In clearing new land the stumps are the great stumbling blocks to the agriculturist, and the word "stumped" has passed into a proverb as expressing the full stop, either to the plowman or the stump orator and arguer. It is of value, therefore, to know that dynamite or giant powder is the agent which can be used with the least labor and expense in removing these pests of the farmer, the unsightly stumps which ornament many a fair field, leaving awkward angles where there should be straight furrows, and providing the village blacksmith with constant employment in the re-sharpening of broken plough points. Indeed, if we can trust the reports of recent experiments in England, not only will the use of this explosive remove the stumps, but at the same time supply the farmer with an unlimited amount of firewood ready sawed and split, although, as we should imagine, somewhat scattered. A short time since a series of experiments with dynamite were made on an estate near Birmingham, England, with, according to our exchange, the following results:—

"The first to be experimented upon was a large, ugly ash root, and it was decided it should be split up without boring an auger hole into it; consequently, a charge of two cartridges was placed in a natural recess on the side of the root and fired. To the astonishment of those present, the whole mass was shivered into firewood. Several other roots were then broken up with equal success without the use of the auger, A very large oak root was then broken up, so large, in fact, that the ties or roots had to be cut asunder; the ground got from underneath, and the whole dropped about eight feet beneath the surface of the soil—it was intended to drop and bury it on account of its extreme size and cost of labor. Two crowbar holes were made, one on each side the root, facing each other, and both charged with about ½ lb. dynamite. These were fired simultaneously, from the effects of which the monster was broken into four quarters; two more shots completely split the mass up, much to the satisfaction of all present. The experiments were concluded by blowing bodily out of the ground a large intact oak root; this was done by making a crowbar hole between the ties or minor roots, and inserting a charge of dynamite under the centre. On the shot being fired, the root was completely lifted from its bed."

—A. T. Stewart, the millionaire merchant, died in this city on Monday last, and will be buried to-day. His vast business will be, for the present at least, conducted under the management of Judge Henry Hilton, his legal advisor. It is not known as yet what disposition is to be made of his estate.

—We would call the attention of gentlemen who may be looking for such a place to the advertisement in another column of Willow Lake, the residence of R. Francis, Esq. Probably there are few places on Long Island possessing all the attractions of this valuable property; a fine residence with all appurtenances, and a fine lake and stream for the propagation of trout. The location is salubrious and attractive, being situated near Glen Cove, on the north side of the island.

—We are pleased to notice the success of the Eclectic Library, No. 33 Union Square. The large number of new books daily put in, and the little delay in getting any or all new books, its easy access, the prominence of its location, with its thorough system and pleasant appearance, make it a popular and desirable place of resort. All the latest English, French, and American publications, books, reviews, novels, periodicals, etc., are on sale, together with photographs, stationery, etc.

—The monthly record of the thermometer, as furnished by our correspondent, Major George J. Alden, at New Smyrna, Fla., shows the mean temperature for March to have been 70½°; highest, 82°; and lowest, 45°.

KANGAROOS IN FRANCE.—A large number of kangaroos have been imported to France from Australia, and are found to thrive excellently in their new home. Already they are becoming plentiful, and in some places the flesh is sold in the market, and it is thought a great dainty.

The Kennel.

THE POINTS OF A SETTER.

LAST week we published a letter from the veteran field sportsman Ethan Allin, in which he suggests the propriety of some skillful sportsman giving the general outlines of the most approved form of the setter of the present time, in order that the owners of dogs can, with some degree of certainty, select such as would probably be entitled to premiums at the coming bench show. In reply to this letter we say that we consider Mr. Allin among the most skillful of our correspondents upon dog subjects, and we will be glad to publish an article from him giving his views; yet it would be very difficult for him or any one else to write out a set of points for the government of judges at bench shows which would be carried out; for the reason that it is very frequently impossible to see the exact form of a dog when brought upon the bench, as many dogs, when forced in among strangers, cannot be induced to move around or stand in position long enough to enable the judges to see exactly what his true form is.

There are, however, some points which it is important a setter should have to entitle him to a prize at a bench show. Among them is the size; he should not be overgrown or diminutive. He should stand square upon his legs, which should be neither too long or too short, but in proportion with the size of his body, and by all means standing a shade higher before than behind. Tail should come out well up, and be straight or scimeter-shaped, and should be carried on a level, or rather above the level of the back, and by no means too long. A tail reaching to the gambril joint, or an inch below, is about right. A cut tail is not excluded from our bench shows unless so cut as to disfigure the dog. The chest should be deep and somewhat rounded; loins, muscular. Feet should be rounded and somewhat feathered between the toes. A short, thick neck never looks well. Ears should be long and somewhat rounded at the points, but not so long as to give a spaniel look, and they should be well coated, fringe hanging below the rim. A thick ear would indicate ill breeding. Head should be broad at the top, and nearly square to the eyes, and the latter should be full, bright, of gentle expression. Muzzle should be well squared out, and lips slightly pendulent. Coat should not be curly, but long and wavy. Many persons prefer that the feather on the hind legs should extend below the gambril joint, and many of the best bred dogs have it, but we do not consider it either ornamental or useful.

In regard to the best colors for a dog for field purposes, a great diversity of opinions prevail. In shooting over an open country—the prairies, for instance—it does not matter so much about colors; but in shooting in dense coverts it is important, we think, that a dog should be of such colors as can readily be seen—such as orange and white, lemon and white, black and white, or black, white and tan.

We consider that all dogs entered for prizes should have a pedigree sufficient to satisfy the judges that they are thoroughbred; but that imported dogs, because they have a pedigree as long as the moral law, should receive a prize over an American-bred of equal qualifications, is an absurdity.

THE SPRINGFIELD BENCH SHOW.—On the 26th and 27th inst., the Rod and Gun Club, of Springfield, Mass., will hold what promises to be one of the largest and most successful bench shows of dogs ever held in this country. At least we judge that such will be the case, first, from what we hear among sportsmen as to the number of entries to be sent from this vicinity alone, and secondly, from the energy displayed by the club last year in bringing their show to a successful issue, and with the experience gained on that occasion, the present cannot but be superior. The prizes are both numerous and valuable, and it only requires discrimination in the selection of the judges to give satisfaction to exhibitors—that is, as much satisfaction as is pos-

sible at a bench show, where every exhibitor is likely to consider his animal the best in the building. The classes are divided as follows, there being from three to eight prizes in each class:—

CLASS 1.—Imported English Setters or their progeny that have never taken first prize at any bench show.
CLASS 2.—Imported red or red and white Irish setters, or their progeny, that have never taken first prize at any bench show.
CLASS 3.—Imported black and tan and black and tan and white Gordon setters, or their progeny, that have never taken first prize at any bench show.
CLASS 4.—Native setters of any strain that have never taken first prize at any bench show.
CLASS 5.—Pointers of 50 lbs. weight and over that have never taken first prize at any bench show.
CLASS 6.—Pointers under 50 lbs. weight that have never taken first prize at any bench show.
CLASS 7.—Cocker spaniels.
CLASS 8.—Clumber spaniels.
CLASS 9.—Retrieving spaniels.
CLASS 10.—Irish water spaniels.
CLASS 11.—Fox hounds.
CLASS 12.—Beagles.
CLASS 13.—Dachshounds.
CLASS 14.—Deerhounds.
CLASS 15.—Greyhounds.
CLASS 16.—Newfoundland.
CLASS 17.—St. Bernards.
CLASS 18.—Mastiffs.
CLASS 19.—Bull dogs.
CLASS 20.—Bull terriers.
CLASS 21.—Collies or shepherd.
CLASS 22.—Dalmatian or coach dogs.
CLASS 23.—Spitz.
CLASS 24.—Scotch terriers.
CLASS 25.—Skye terrier.
CLASS 26.—Dandie-Dinmont terrier.
CLASS 27.—Rough haired terrier.
CLASS 28.—Pug terrier.
CLASS 29.—Black and tan terrier.
CLASS 30.—Toy terrier.
CLASS 31.—Blenheim spaniel.
CLASS 32.—St. Charles spaniel.
CLASS 33.—Japanese spaniel.
CLASS 34.—Italian greyhound.
CLASS 35.—Poodle.
CLASS 36.—Japanese or hairless.

CHAMPION CLASSES.

CLASS 37.—Champion setter class—For the best imported setter dog or bitch of any strain or their progeny that has taken first prize at any bench show, including this, silver cup, value $250; donated by *Spirit of the Times*, No. 4 Park Row, New York; the winner's picture to be published in that paper.
CLASS 38.—Champion setter class—For the best native setter dog or bitch of any strain that has taken first prize at any bench show, including this, silver cup; donated by *Chicago Field*, No. 14 South Canal St., Chicago, Ill.
CLASS 39.—Champion pointer class—For the best pointer dog or bitch that has taken first prize at any bench show, including this, double-barrelled breech-loading shot gun, value $150; donated by Parker Brothers, manufacturers of fine guns, West Meriden, Conn.

SPECIAL CLASSES.

CLASS 40.—For the best collection of setters (not less than three) owned by one person, the average number of points to decide the award:—Rifle, value $60.00; donated by Frank Wesson, manufacturer of breech-loading rifles, Worcester, Mass.
CLASS 41.—For the best collection of pointers (not less than three) owned by one person, the average number of points to decide the award:—Green Heart fly rod, $50 00; donated by J. S. Crook & Co., dealers in fishing-tackle, No. 50 Fulton street, New York.
CLASS 42.—For the best brace of setters owned by one person, winners in class No. 40 not to compete:—Meerschaum pipe, value $150.00; donated by FOREST AND STREAM, No. 17 Chatham street, New York.
CLASS 43.—For the best brace of pointers owned by one person, winners in class 41 not to compete, Meerschaum pipe, value $150.00, manufactured by Kaldeburg; donated by *Hot and Cold* newspaper, No. 33 Park Row, New York.
CLASS 44.—For the best setter dog pup, one waterproof Canvas shooting suit, value $25.00; made to fit the owner; donated by Thompson & Son, 338 Broadway, New York, dealers in sportsmen's goods.
CLASS 45.—For the best pointer dog pup, one of Holahird's shooting suits, made to fit the owner, value $20.00; donated by Dr. W. S. Webb, St. Luke's Hospital, New York.
CLASS 46.—For the best litter of setter pups, silver cup, value $25 00; donated by Luther Adams, No. 215 Broad street, Boston, Mass.
CLASS 47.—For the best litter of pointer pups, 500 paper shells, 100 metallic shells, value $25.00; donated by Union Metallic Cartridge Co., Bridgeport, Conn.
CLASS 48.—For the best setter bitch pup, a dog puppy by "Pride of the Border," out of "Dimity;" donated by Charles H. Raymond, 141 Broadway, New York.
CLASS 49.—For the best pointer bitch pup, Smith & Wesson revolver, No. 38, value $15.00; donated by D. B. Wesson, Springfield, Mass.
CLASS 50.—For the largest dog, gold-lined cup, value $10.00.
CLASS 51.—For the smallest dog, gold-lined cup, value $7.00.
CLASS 52.—For the best bitch dog or bitch, gold medal. For the second best trick dog or bitch, silver medal.

ENGLISH KENNEL EVENTS.—The following is the programme of the National Pointer and Setter Field Trials to be held near Shrewsbury on the 26th and 27th inst.:—

POINTERS ON PARTRIDGES.

1.—Pointer puppy stakes, for dogs or bitches, puppies of 1875.
2.—Sunderne stakes, for single aged dogs, limited to 20.
3.—County stakes, for single aged bitches, limited to 20.
4.—Cloverley stakes, for braces, pointers or setters, all ages.

SETTERS ON PARTRIDGES.

5.—Setter puppy stakes, for dogs or bitches, puppies of 1875.
6.—Attingham stakes, for single aged dogs.
7.—Shrewsbury stakes for single aged bitches.

CHAMPION PLATE.—A piece of plate, value £20, will be given by the Committee for the best dog of the meeting, to be competed for by the winners of the stakes, No. 1, 2, 3, 5, 6, 7. £5 5s. entry fee.

The prize schedule of the Kennel Club field trials, to be held on May 4th and 5th, is now out. There is, besides the Field Trial Derby, an All-Aged stake for pointers and setters, limited to sixteen, the winner to take a £10 cup and £40, the second £20, and third and fourth £10 each, the second prize to go to the opposite breed to the winner. Then there is the Kennel Club Challenge Cup, added to an optional sweepstake of £10, £5, or £3, the cup to be won three years by one member (not necessarily in successive years or by the same dog) before becoming his absolute property.

There will be two meetings in London for sheep dog trials this summer, the Kennel Club meeting on the 29th and 30th of June, and a meeting is announced at Lillie Bridge on June 21st and 22d.

—A short time since I noticed a correspondent asking a cure for egg-sucking dogs. I say to him to take an egg, make a small hole in end of shell, and fill with cayenne pepper. Seal up with a bit of court plaster, and place where puppy will get it. He will never try another. It took just one egg, thus prepared, to cure my dog, who was extremely fond of eggs. S. W. B.

Connersville, Ind.

THE IRISH SETTER AGAIN.

RICHMOND, April 7th 1876.

EDITOR FOREST AND STREAM:—

In your issue of March 23d, "Mont Clare," in writing of the Irish setter quotes from Stonehenge and ignores all authors who give his favorite any color except his beloved red. Now, I have a copy of his author, and have searched in vain for the paragraph quoted, and while I do not accuse the writer of a false quotation, I think there is some mistake in this case. On page 586 of "British Rural Sports," this same author says, "the color of the Irish setter is usually red or black-and-tan." Assuming that Mont Clare's quotation is correct, we see that this as emphatically says there are black-and-tan, and also leads us to infer that he has seen them of other colors. Then will Mont Clare say that this author is consistent. If he will not—then can he claim his quotation as authority? Now let us see what he says of judging dogs by their color: "By many experienced breeders it is thought that shape and performances follow color, and that, in picking a puppy, it ought to be selected by its near approach to that color which its best ancestor showed. This rule I have seen used in numberless instances, but I never saw that it led to any good results; on the contrary, as with most other rules in the choice of whelps, I believe it only leads to dependence on a rotten weed.

Now, friend "Mont," one more question and I am done. Will you tell me in what part of Stonehenge he speaks of the great reputation of the Irish setter. I can't find it, but can find where he says the Russian is the best setter, and the old Spanish pointer his superior. Also that he believes the setter to be a cross between the spaniel and Newfoundland. After this do you take stock in Stonehenge? And now, kind friend, since I have polated out some few things from your modern writer, which you over looked in your hurry, take my advice in future: never quote from an author before reading his work through, to see that he is consistent. Unless you wish to argue from an unbiased point, and show this people your subject in its true light.

In writing the above I am actuated by no ill feeling towards the red dog, for he is my favorite, but by a desire to instigate farther search among modern authors, and if they have not the necessary data among those who have the dust of ages upon them. CHARGE.

THE BEST TREATMENT FOR DISTEMPER.

EDITOR FOREST AND STREAM:—

Since my last letter on the treatment of three dogs with distemper or pneumonia, my pointer bitch Whisky has had a severe attack of the disease. It commenced with a running at the eyes and nose and a very slight cough. She was immediately put on 2 grs. of quinine a day, commencing March 17th. On the 19th, 21st, and 23d she received a 1 gr. calomel pill. On the 23d she was given up, and I received a telegram to that effect. The quinine was then increased to 2 grs. three times a day, and every two hours she received one-half teaspoonful of the compound syrup of squills, until she had taken six doses, each dose containing 1 1-6 grs of tartar emetic. This relieved her breathing, which had been very hard and rapid. On the 24th she was much better, and the quinine was continued three times a day until 1st of April. She is now rapidly gaining in flesh and perfectly well, and should everything go well I hope to have her in condition to exhibit at Springfield on the 26th and 27th of this month. The calomel, in my opinion, should only be used until the bowels are thoroughly relaxed, and should they become too loose, 1 gr. of opium, or some astringent, may be given. As soon as the respiration becomes labored one-half a teaspoonfull of the syrup of squills, given every one or two hours until four or six doses have been taken, will sometimes afford great relief; the fever, pulse, and respiration all subsiding a little. This may be repeated in a day or two. Should there be any tendency to diarrhœa I would advise all solid meat be witheld, and milk, beef tea, and gruel be substituted. Had Whisky been with me I would have given her first 2 grs. three times a day, and then increased it to 3 grs. three times a day. GROUSE.

HOUNDS RETRIEVING.

GRANBY, Conn., April 3d, 1876.

EDITOR FOREST AND STREAM:—

Doubtless many sportsmen will smile at the idea of hounds being brought to retrieve, but I have a young dog which I have thoroughly broken to bring either fur or feather, and find it almost as useful in accomplishment in a hound as in a setter or pointer, and would strongly recommend to have hounds broken, particularly if they are to be used on rabbits, as I do mine, as the great northern hare is quite plenty in this vicinity, and affords fine sport to lovers of dog and gun. My hound has also found and brought to me several articles that I have lost (among them a ring), and can be sent for a pair of gloves that are not fastened together, and will bring them both, and I think is worthy of occupying a bench at the great dog show to be held in Springfield this month, if his ancestors are all natives of this county. A. ELMORE.

[There should be no more difficulty in teaching a hound to retrieve, if it was desirable to do so, than a setter or a pointer.—ED.]

NEW BRIGHTON, Beaver County, Pa., April 3d, 1876.

EDITOR FOREST AND STREAM:—

While boating quail last fall, a little incident occured which, if of any interest to readers of FOREST AND STREAM, please publish. My setter pup Sam had stood a pheasant (grouse) which I missed, a mice open shot, at which, becoming a little riled, I said very sharply, "charge." My pointer Button was on the other side of a six-rail fence, and was just in the act of getting over when I said "charge" to the pup. Mr. Scott called my attention to the pointer who had come to a down charge on the sixth rail or rider, and was charging like a Major, and remained so until ordered to bie on. I killed over the setter pup from October 1st to January 1st, nearly 200 quail and 45 pheasants. He will be twelve months old April 22d, 1876. I send photograph.

JOSEPH J. SNELLINGBURG.

[The photograph sent represents a remarkably handsome setter.—ED.]

Game Bag and Gun.

GAME IN SEASON IN APRIL.

Wild duck, geese, brant, &c.

GAME IN MARKET.—Ducks are being received in fair quantities from the South Side of Long Island. Mallards sell for $1 25 per pair; brant, $1 75; widgeon, broad bills, and black ducks, from 50c. to $1; wild geese, $1 to $1 50 each. A few snipe have been received from New Jersey, and very considerable numbers from Ohio, selling at $3 75 per dozen for the former, and $3 for the latter. Plover are also coming from the West, and bring at present $2 per dozen. Wild pigeons sell for $2 to $2 50 per dozen; squabs, $4.

SINGULAR ACCIDENT.—A singular accident occurred to three young men on Little Long Pond, near Pine Grove, Penn., last week. They were shooting ducks from a punt with a swivel gun, when the gun burst, killing two of the men and throwing the other overboard with a broken thigh. Moral. Don't shoot ducks with a swivel gun.

NEW YORK—*New Hamburgh, April 7th.*—Ducking on the river (Hudson) at this point has been extremely thin. We boast of a fleet of eleven duck boats, and the fares of the whole fleet has not exceeded one hundred ducks this spring. The Le Roy Bros. captured five wild geese, besides forty ducks. The reason of such poor shooting was lack of floating ice, and ducks could not be approached. As present they have all gone north except the black ducks, which are confined to the sloughs and pond holes around the country. BLUE JAY.

RHODE ISLAND—*Newport, April 3d.*—I find on inquiring among the shooters that about two dozen snipe have been shot prior to to-day. A southeast rain storm is pouring down which will bring more birds, and I will send you a score a snipe soon. Brant and sea-fowl are flying by our points and gunners are preparing to give them a welcome the first soutber. SHOT.

MINNESOTA—*St. Paul, April 6th.*—Geese, brant, and ducks are reported as being very plentiful along the line of the St. Paul and Sioux City Railroad, between Sioux City and the Missouri Valley Junction.

MISSISSIPPI—*Corinth, April 4th.*—We have had some fine snipe shooting, and bagged three gobblers to date. I bagged twenty snipe in two hours' shooting about the 20th March. They have all gone north now; left about the 1st instant. Have not seen a woodcock this season. GUYON.

A WILD GOOSE CHASE.

MILLVILLE, N. Y.

EDITOR FOREST AND STREAM:—

There were three of us, a lawyer and two doctors, who tiring of professional routine concocted a plan to steal a day for mental, moral, and physical relaxation, so after fixing the day (March 15th,) and amply providing ourselves with all the accoutrements for a "wild goose chase," we converged from three points of the compass, at Whiting's Station a general railroad junction in Jersey, where the New Jersey Southern Tuckerton, and several other roads stop to interchange passengers and freight. Our objective point was Barnegat, where we duly arrived in good time for a wholesome dinner at the Mullin House, immediately after which we sailed across the bay to Kinsey's Ashley House, about a hundred yards from Barnegat Light. It was a beautiful day and we enjoyed a pleasant sail of five miles. Everything indicated a profitable day's sport on the morrow. Wild geese and brant by the thousand were waiting to be shot, but apparently in no hurry about it as they kept a long distance off from any visible man.

We thought we had made every necessary preparation; having written to Mr. Kinsey that we were coming, we met him at the Mullin House and he informed us that his business carried him to Philadelphia, but his son would be at the Ashley House; that gunners, with boats and stools were there expecting us, that every thing in and about the house were to be used by us as though they were our own, &c. But alas "the well laid schemes of mice and men gang aft agley." The house would have answered our purpose well enough had its surrounding been even in proportion. The promised son was there (aged eleven) together with a colored lad a little older; these were our hosts, and most any small privilege was fifty cents.

This beach is about sixteen miles long, and the natives consist of stump-tailed cats and cannibals. Dr. Short thinks they live on clams and strangers. A life-saving station is located here, consisting of some half dozen seamen, who are the gunners or guides of the beach. Their time is limited for this sport as they are compelled to be on duty between twilight and daylight. On inquiring for guides one of them appeared and Dr. Short interviewed him. He was tall, spare, and sallow, and seemed to be pleasant, but the Judge concluded that he was born bilious.

"Can you and your companions, take us out for geese and brant tomorrow?" Inquired Dr. Short.

"Well" said Bilious, "We did not know you were coming, we are not prepared and it depends a good deal on the weather, sir."

"Do you think the prospect good for a bag of fowl?"

"Well, not very, the wind is wrong, and the tides are low."

"But do you think you can take us out" persisted the Doctor,

"Not until we can see up and down the coast, and not then if there are any wrecks on."

"What do you charge for your services?" quietly inquired the Doctor after a little pause.

"Three dollars a day and found."

"And what does it all amount to when you are found?"

"Two dollars for board and seventy-five cents for ammunition."

"And that" said the Doctor, "makes five dollars and seventy-five cents apiece per day?"

"Yes sir," said Bilious.

The Doctor expressed our united sentiment quite emphatically, when he said we did not come over there to be eaten up, nor robbed, and that he was about ready to retrace his steps to Barnegat and thence home; at which a happy smile stole over the countenance of the youthful landlord as he informed us that our prospect in that direction was quite uncertain. The wind was wrong, the tide was out, and in short just such parties as we, were often weather-bound for weeks. There was but one boat and she aground, and belonged to the tall, bilious, life-saving gunner. What a predicament. We immediately appealed to him but without avail. He "would rather not," his boat would not float before twelve, the wind was wrong, tide was out, &c., and finally gave us a emphatic "no." He had evidently "soured" on us from the moment of our arrival, and seemed to throw every obstacle in our way possible, and like a coy maiden, played shy, as we thought, because we did not empty our pocket books into his lap. We could not help it. We went to bed with one object of our trip accomplished, relaxed morally. In the morning we were up by times. The bay full of game, and we without the means to reach them. One of these gunners went out alone and returned in about two hours with a half dozen brant. We held a council of war, and it resulted in some emphatic expletives from Dr. Short, and large heads of cold sweat from the brows of all of us. Robinson Crusoe might have been lonesome, but he never stood on the beach with a double barrelled breech-loader while thousands of birds cavorted away out in the sounds. "Doctor why don't you shoot," said we. "Do you think I want to strain this gun? No sir, I think too much of this gun ture the Judge's inventive genius came to our rescue. "I have it," said he, "We will confiscate the professional acquirements of these gentlemen. They shall send a telegram to Cape May, thence to Washington to New York, to Philadelphia, thence to Barnegat to Sam King, of the Mullin House, to send a boat to take us from this inhospitable island. They did it, and in about ten minutes Mr. Phillips informed us that Mr. King would send us a yacht. In a few minutes more a little white sail started out from under the opposite shore and then we knew we were saved. The Judge insisted that he never was so glad to see a man before in all his life. And thus we stole away from these strange and stranger loving people. And how great the contrast. We were soon among civilized people who seemed to vie with each other in making a comfortable and arranging for a days shooting on the morrow. We retired early, to rise early, and at 5 o'clock A. M. we were in our sneak boats with decoys out "lying low," for geese and brant, and for seven hours we had fine sport, when the wind veered and the game sought its

other side of the bay, leaving us to try the oars against a strong wind for about three miles, landing again at the Mullin House with an appetite for supper, and the second object of our trip accomplished, relaxed physically. The mental relaxation we now enjoy in retrospecting the pleasant features of the trip. The unpleasant remembrances consist in venturing to the beach without the means to return, and in depending upon finding guides there.

If any of your readers desire an excellent days sport in Barnegat Bay, let him first write to Sam King at the Mullin House and we will guarantee that he will make the best possible arrangement for them to go in comfort and be well pleased with the trip. LONG, M. D.

But why does not our correspondent state the charges for boat, guide, etc., on his successful attempt.—[Ed.

DUCKING ON SHINNECOCK.

NEW YORK, April 5th, 1876.

EDITOR FOREST AND STREAM:—

The writer returned from Wm. Lanes on Saturday last, bringing with him two geese and about thirty broadhills, the result of a week's shooting. Owing to the great number of "southeasters" recently Old Shinnecock was so full of water that it was impossible to find a sand-bar to stand a goose rig upon. It was not until the morning I left that the tide was low enough to stand out the five stool. I may add here that Lane has twenty-two of the best "stoolers" in that or South Bay, and when set out on a bar, giving out their honk! honk! to a bunch of their wild fellows it is rarely that they do not bring them within the range of the expectant sportsmen who have been so carefully concealed by Lane in the sedge boxes. The bay is filled with ducks, broadbill and redheads predominating, but owing to severe weather and high winds it was impossible to lay a battery, so all of my birds were shot from shore blinds. Lane has a large comfortable house situated on the shore of the bay, with every convenience for sportsmen, he himself being one of the greatest attractions, for no one can help enjoying themselves while in his company, he being a perfect gunner, well schooled in everything pertaining to his craft. His fund of anecdote is large, and after a day well spent on the bay it is a pleasure to draw up by a big wood fire and listen to his recollections of wonderful shots and bags made on Shinnecock's shores and bosom. The kitchen is conducted by Mrs. Lane in a manner that would bring health and appetite to a dyspeptic. I shall long remember with pleasure the hours I have spent in her pleasant dining room, and hope to spend many more in the same place. No gunner is allowed to leave the house in the morning, no matter what the hour, without a hot breakfast, and a good one at that, for the motto there is "A full stomach makes a clear eye and a steady hand." In my enumeration of the virtues of the place I must not omit to mention "George," Capt. Lane's helper. What he does not know about sailing, picking up crippled ducks, and swimming geese is not worth knowing. The heaviest flight of geese has yet to come, and sportsmen who go down any time before the 25th of April will have good shooting.

SCAUP.

ANOTHER TRIBUTE TO CALE LORING.

GREENPORT, L. I., March 16th, 1876.

EDITOR FOREST AND STREAM:—

Dear FOREST AND STREAM I have just received the extra numbers of the Cale Loring article, and return my thanks. I have received a letter concerning him from Mr. Charles S. Cleaves, Biddeford, Maine, and one of his friends, and I make an extract or two from his letter which you can use if so inclined.

"Cale and myself were out in a good cover on the banks of Saco River, where he shot 38 out of 40 woodcock; and Cora, his dog, made a good point on a live bird with a dead one in its mouth. And what you say of his big single gun, with which he killed the last one of the seven old squaws, reminds me of another instance of his skill with it. I was once with Cale at the 'shanty,' when he exclaimed that he heard geese! Taking our spy-glass we saw there were eight geese on a sand-bar down at the Partings, as we called it. We put two double guns and the big single gun into his little float, and he started off against flood tide and head wind in pursuit. Presently, as the fowl were about to fly, bang! bang! went his heavy 14-pound double gun; and jumping to his knees with his light double gun he fired two more in quick succession, and *seven* of the geese were down. 'O!' I cried, 'he has lost one of them,' when bang went the old single gun, and down came the last of eight large, heavy geese. He had sculled a mile and a half against wind and tide, and his nerves were still steady enough to kill off a whole flock of that shyest and toughest of sea-fowl." ISAAC MCLELLAN.

Another correspondent sends us from Biddeford, Maine, a similar recital of the above circumstances.—ED.

PENN YAN NOTES.

PENN YAN, March 31st, 1876.

EDITOR FOREST AND STREAM:—

Oscar Conkling, of this place, discerned a flock of nineteen wild geese in a rye field near this place a few days since and succeeded in stalking near enough to obtain a double shot, bagging four birds. The next thing on the programme was a trap shoot between W. B. Sheldon and H. D. Pratt, at 25 yards rise, 1¼ oz. shot, No. 8, ten birds each, with this result:—

Name.	Score.	Total.
Sheldon	1 1 1 1 1 0 1 1 1	9
Pratt	1 1 0 1 1 1 1 1 1	9

They then went back to 31 yards, and shot at three birds each, Pratt killing two, Sheldon none. Each man used Sheldon's gun, a Scott breech-loader, which he ordered through a house in Boston, made according to his directions. It is a 12-bore 30 inch barrel, and weighs 7½ pounds, and makes a better target than the crack Scott gun owned by Capt. Bogardus, or than any target ever published. I should have mentioned in the proper place above, that at the 31 yards distance six paper shells were used loaded with 3 drs. of pawder and 1 oz. of No. 7 shot. With but one exception all the birds shot at were hit. A. PILL.

WILD TURKEYS IN TEXAS.

ROUND MOUNTAIN, Texas, January 21st, 1876.

EDITOR FOREST AND STREAM:—

Our climate being so mild, it requires but little time and expense to prepare for a few days' camp life. Most generally here—on the frontier—hunting parties go out on horseback, taking some bread, coffee, and salt, with a blanket or two each for bedding. Should they expect to be gone a week they make better preparations, taking a wagon and more provisions.

Thursday noon being the time set to start on our last excursion, we got everything ready in the morning. By putting in the wagon cornbread, coffee, and salt enough for two days' rations for four, Some of my fellow sportsmen would think perhaps they would surely starve with so small an assortment of edibles, but would find out their mistake were they to visit our country. Though they may not eat cornbread at home, in Texas, they would say it was the sweetest and best bread they had ever eaten, and call for it three times a day.

But I am getting off the track. We were all ready to drive to the hunting ground as soon as the horses were harnessed. Here comes Mack B. with two Spanish caballos. He is driving in off the range. While Mack and I fasten the ponies to the wagoo, Dr. B. and Mr. T. make themselves comfortable on the spring seat. The last trace is hooked, and Mack and I take reserved seats on the provision box. The ponies not having been used lately, and their stomachs being well filled with that most delicious grass, called mesquit, start off at a brisk trot, soon leaving the old cabin home far in the rear. A three hours' drive found us in camp without meat. Leaving Dr. B. in camp to build a fire and cut broiling sticks, Ed, Mack and I took to the cedar brake for turkeys. We had been out about half an hour, when bang! went Mack's No. 10. Looking off in the direction of the report, we saw a scattered flock of about fifteen turkeys flying towards us. They soon began to call, and Ed and I taking the course, we each bagged a fine gobbler. It now being late, we left for camp, where we found Mack preparing his—a gobbler—for supper. The turkeys being cleaned, we each broiled us *quantum sufficit*, and gathered around the pile of bread. To say we ate heartily would be drawing it mild. We ate an abundance, especially of the fat turkey. I said fat turkey; they get so fat here that when shot flying, a fall of twenty feet on the ground very often *bursts* them open. Supper being over, and not caring to go to the roosts, we built a huge fire of cedar and mesquite (*Acacia vera*) logs, talked over the next day's doings for an hour or so, till one by one, getting sleepy, we rolled ourselves up in a blanket to dream of turkey hens and gobblers all through the night. Next morning found us all right, though Mr. T. feared several times during the night he would be devored by wolves, or attacked by a panther, either of which might occur here, as we are troubled with a goodly number of both, and their howls and screams were repeatedly heard during the night.

As we had only killed three turkeys the day before, we concluded to make up the deficit on the next. Each man taking his course, started out with great expectations. We will leave you to judge whether they were realized or not. A little after sundown the last man reported, and deposited his game on the common pile. A count is made, and is found to foot up eleven for this day, making a total of fourteen turkeys—twelve gobblers and two hens. Next morning we started home, the Dr. to drive down the creek to the mouth of the canyon, while we skirted the lakes for more game. At the meeting point we added to the Dr's load several more gobblers and a fat buck. Mr. T. had the good luck to find the deer in easy range, about three hundred yards from our place of meeting. One charge of BB. shot did the work. We now had a load—seventeen gobblers, two hens, and a large deer, we having eaten two gobblers in camp, made us a total of twenty-one fat turkeys and a fat venison, in less than two days' hunt. On arriving home, father and Mack skinned the deer, while Ed and I on our ponies carried Christmas dinner to our neighbors. J. T. B.

Rational Pastimes.

NEW YORK ATHLETIC CLUB.—The seventh annual spring games of the New York Athletic Club will be held at their grounds, Mott Avenue and 150th street, Mott Haven, New York city, on Tuesday, May 30th, 1876 (Decoration Day), to commence promptly at 1:30 P. M. The following games will be open to all amateurs: 100 yards, 440 yards, half mile and one mile running, 120 yards hurdle, one and three mile walks, running high and running broad jumps, putting the shot, and throwing the hammer. Entries will be received up to 3 o'clock P. M. on Saturday, May 20. Contestants must describe their colors and uniform; the latter must consist of shirt and trunks or drawers extending to the knees. No competitor will be allowed to enter under a false name, and the club reserve the right of refusing any entry. The same person may enter in any one or all of the games, but his entry must specify those in which he intends to compete. In order to insure *bona fide* entries, an entrance fee of $2 will be charged for each game, which money will be returned to all persons who compete. Our definition of an amateur is as follows:—An amateur is any person who has never competed in an open competition for a stake, or for public money, or for admission money, or with professionals for a prize, public money, or admission money; nor has ever, at any period of his life, taught or assisted in the pursuit of athletic exercises as a means of livelihood, nor is a mechanic, artisan, or laborer. All entries must be accompanied by a certificate from some well-known athletic or rowing association, or from some person known to the club, that the person entering is an amateur under our rules. Alfred H. Curtis, Secretary, box 2003 New York P. O.

—The following is the score of the chess tourney now in progress in this city up to the 9th inst:—

PLAYERS.	Mackenzie	Alberoni	Mason	Bird	Ensor	Richardson	Delmar	Brenzinger	Becker	Perrin	Barnett	Dill	Roser	Parnell	Smith	Baird	Hind	Games Won	Games Drawn.
Mackenzie								2		1			2		2		2	7	1
Alberoni									2			2		2				6	3
Mason				1		0	1					1						4	3
Bird						1		0	1		0		2					6	2
Ensor						1									2	2	2	5	0
Richardson				0	0		0	1							2		2	5	0
Delmar				0	0	1			0	1		1						3	2
Brenzinger				0	0	1												2	0
Becker				1		0	1			0	1	2						5	1
Perrin				0		1		2			0		0					1	0
Barnett						0		0		1			1					1	1
Dill				0	0	1				2	0			0	1	0	1	1	1
Roser											1	2					2	4	0
Parnell				0	0							1					1	1	2
Smith				0	0												2	2	0
Baird												1	0	0				1	0
Hind				0	0								1	0	0			0	0
Games Lost	0	0	1	2	1	3	3	4	3	5	3	4	3	5	6	7	5	57	15

The figures indicate won games, the cyphers lost games and the dashes for games not played or drawn.

—The following is the latest placing of the field nines of the professional clubs, of which ten will enter the arena for the United States championship, and eight for the League Association pennant:—

ATHLETIC.—Coons c., Knight p., Fisler 1st b., Fauser 2d b., Sutton 3d b., Force s. s., Hall l. f., Eggler c. f., and Meyerle, r. f.

BROOKLYN.—Hicks c., Matthews p., Start 1st b., Craver 2d b., Nichols 3d b., Hallinan s. s., Booth l. f., Shaudley c. f., and Boyd, r. f.

BOSTON.—McGinley c., Borden p., Murnan 1st b., Leonard 2d b., Schafer 3d b., G. Wright s. s., Parks l. f., O'Rourke c. f., and Manning r. f.

CHICAGO.—White c., Spalding p., McVey 1st b., Barnes 2d b., Andrew 3d b., Peters s. s., Glen l. f., Hines c. f., and Addy r. f.

CINCINNATI.—Pierson c., Avery p., Fisher 1st b., Sweasy 2d b., Booth 3d b., Kessler s. s., Snerden l. f., Jones c. f., and Clark r. f.

—The following opening games have been played this month by the professional clubs chiefly with semi-professional nines:—

March 29	New Haven vs. Star, at New Haven	8 to 1
April 5	Louisville vs. Memphis, at Memphis	15 to 5
" 5	Picked Nine vs. Athletic, at Philadelphia	9 to 7
" 5	Philadelphia vs. Kleine, at Philadelphia	8 to 6
" 6	St. Louis vs. Picked Nine, at St. Louis	12 to 4
" 6	Louisville vs. Memphis, at Memphis	13 to 1
" 6	Brooklyn vs. Field, at Capitoline Ground	21 to 5
" 8	New Haven vs. Star at New Haven	13 to 4

—The professional games to be played this month are as follows:

April 14, Boston vs. New Haven, at New Haven.
April 15, Boston vs. New Haven, at Boston.
April 17, New Haven vs. Live Oak, at Lynn.
April 22, Boston vs. Athletic, at Philadelphia.
April 24, Boston vs. Athletic, at Philadelphia.
April 25, Louisville vs. Chicago, at Louisville.
April 27, Louisville vs. Chicago, at Louisville.

—An article in DeWitt's Base Ball Guide on base ball pitching says:—

"There are three primary elements required in a successful pitcher, without which no man can ever excel in the position. The first is the command of the ball; the second is pluck in facing the swiftest batted balls, and the third is the judgment to outwit your adversary at the bat. The power to pitch a swift ball, and the endurance to withstand the fatigue of a long game, and also the control of temper sufficient to bear with the annoyances of poor support in the field, are also among the requisites of a first-class pitcher. But these latter qualities would be next to useless without the former, while, on the other hand, a pitcher may be successful even if he can neither pitch swift, endure the work of his position long, nor keep his temper when chances for outs are missed. But speed without command of the ball is too costly to pay, and lack of pluck prevents the use of a man's judgment, and without a man uses his brains in pitching he becomes a mere machine player, and a pitcher any skillful and experienced batsman can punish.

—The *Louisville Journal* says: "The Philadelphia Club players of 1875 have been pretty well distributed among the league clubs. McGeary is in the St Louis nine. Zettlin of the Chicago and Philadelphia nines of 1875, is to replace McBride in the Athletics, in which nine Meyerle is to play second base this year. Fisher, thrown out of the Philadelphia team last September, is in the Cincinnati club now. Addy, a reliable man, is in the Chicago nine. Snyder, another good and true man, as also Fulmer, who is thoroughly reliable, are in the Louisville club, and Murnan and Borden in the Boston. Highnm, of the Mutuals of 1875, is now in the Hartfords. Treacy, Malone, McMullin and Nelson have not yet been engaged, but doubtless they will be."

—The amateur clubs turned out for field practice at Prospect Park on April 8th for the first time this season. Members of the Nameless, Produce Exchange, and Winona clubs, played a game together. The Osceolas, under Capt. Toby Smith of the old Star Club, will open play at the Park next Saturday. There was a game played at the Park on Saturday between nines of the Register and Comptroller's offices of Brooklyn. The Register's nine registered the fewest runs and consequently their adversaries controlled the game.

—A New Haven paper says that the New Havens start off on a Southern trip about the 20th of May, to be absent about three weeks, during which time they will play in many Western and Southern cities, several times with professionals, and a number of games with non-professionals also. The New England exhibition trip of the Bostons and New Havens is being arranged. The two clubs will play together at least one week. The first game will take place at Boston on Monday, April 17th.

—A Philadelphia paper says: "There are four good amateur clubs in San Francisco, including the re-organized Eagles, Californians, Alerts and San Francisco—who, in order to keep peace with the times, have changed their name to the Centennials. It has been determined to hold a grand base ball tournament in this city next summer, as the Centennial celebration would hardly be complete without an exhibition of one national game."

—On Friday next the first of the series of professional club contests for the championship of the United States, takes place at New Haven, when the Boston and New Haven club nines will enter the list together for the first time. The next day the two nines play in Boston, it being the opening match of the season in that city.

—The St. Louis Reds have so far engaged Croft, Magner, Morgan, Owan, Redmond and Dolan. Manager McNeary is on East looking up other players, and will return soon with the number required to complete the nine. Dolan will be remembered as having caught for the Louisville Olympics a portion of last summer.

—Luff, formerly of the New Havens, has joined the Olympics of Memphis. He has the reputation of being a fine ball-player, and it really looks as if our Memphis friends are bent on organizing a good team. Barnie will be their catcher, and Clinton their pitcher—two good men.

—The players regularly engaged for the Cincinnati club for this season are as follows, so says the League book:—Charles H. Gould, Samuel J. Fields, William C. Fisher, Charles J. Sweasy, Henry Kessler, Emanuel Snyder, Charles W. Jones, Robert Clack, David P. Pierson, A. S. Booth.

—De Witt's Base Ball Guide, containing both the amateur and professional code of playing rules for 1876, together with special instructions to umpires, making in all a book of 100 pages of instructive matter, illustrated with cuts, will be issued next Saturday.

—The Brooklyn professionals began field practice on April 6th, and they have been playing against field nines every fine day since then. This week Craver and Shandley will take their places in the nine and work will commence in earnest.

The Yale University nine for 1876 will be as follows: Morgan, c.; Bigelow, p.; Downer, 1st b.; Carter, 2d b.; Abbott, 3d b.; Wheaton, s. s.; Thompson, l. f.; Williams, c. f.; Platt, r. f. They were to have commenced play last week.

—Golden, the swift pitcher of the Westerns of 1876, and who also pitched for the Chicagos after Zettlin was sent away, is to pitch for the semi-professional Stars of Covington this season.

THE NEW

BOSTON

SHOOTING SUIT,

Manufactured only by

G. W. SIMMONS & SON,

Boston, Mass.

We offer this season an entirely new design of WATER-PROOF SHOOTING SUIT (made from extra quality duck), in the preparation of which we have been assisted by the advice and suggestions of our best resident sportsmen.

The design embraces the best points of the English and French Suits, combined with the necessary requirements for American service. Particular attention has been paid to color.

Each suit is thoroughly water-proofed by a new patent process. The seams and pocket corners being securely fastened, the arm holes ventilated, and nothing neglected to render the suit perfect in every respect.

The price has been fixed at $13, to include Hat or Double Visored Cap, Detachable Haverlock, Coat, Vest, and Pantaloons.

One hundred suits will be kept ready in stock, so that we can furnish to order any size required, at a moment's notice.

In the *Golden Rule* (Rev. W. H. H. Murray's paper) the enthusiastic editor writes:—

"We were shown, the other day, a new water-proof suit, specially adapted for sportsmen, designed and made up by Simmons & Son, of Boston, and to which we call the attention of all brethren of the out-door and shore-shooting fraternity, because it meets the demand of personal comfort and convenience beyond anything of home manufacture seen by us before. As a sportsman, we give it our unqualified endorsement, as combining the best points of the English suits, and in addition skilfully adapted to the necessities of the American service. It is a most admirable and satisfactory contrivance in color, style, water-proof quality and capacity. The coat is a marvel in this latter respect."

Persons ordering from a distance need send only the following to be sure of a perfect fit:—Waist Measure, Height, Breast Measure, Length of Sleeve, Size of Head.

THE SPORTSMEN'S ROUTE.

Chicago & Northwestern Railway.

This great corporation now owns and operates over two thousand miles of road, radiating from Chicago. Like the fingers in a man's hand, its lines reach in all directions, and cover about all the country north, northwest, and west of Chicago. With one branch it reaches Racine, Kenosha, Milwaukee, and the country north thereof; with another line it pushes through Janesville, Watertown, Oshkosh, Fond du Lac, Green Bay, Escanaba, to Negaunee and Marquette; with another line it passes through Madison, Elroy, and for St. Paul and Minneapolis; branching westward from Elroy, it runs to and through Winona, Owatonna, St. Peter, Mankato, New Ulm, and stops not until Lake Kamesika, Dakota, is reached; another line starts from Chicago and runs through Elgin and Rockford to Freeport, and, *via* the Illinois Central, reaches Warren, Galina and Dubuque, and the country beyond. Still another line runs almost due westward, and passes through Dixon, Sterling, Fulton, Clinton (Iowa), Cedar Rapids, Marshalltown, Grand Junction, to Council Bluffs and Omaha. This last named is the "GREAT TRANS-CONTINENTAL ROUTE," and the pioneer overland line for Nebraska, Colorado, Utah, Idaho, Montana, Nevada, California, and the Pacific Coast. It runs through the Garden of Illinois and Iowa, and is the safest, shortest, and best route to Omaha, Lincoln, and other points in Nebraska, and for Cheyenne, Denver, Salt Lake City, Virginia City, Carson, Sacramento, San Francisco, and all other points west of the Missouri River.

TO SPORTSMEN:

THIS LINE PRESENTS PECULIAR ADVANTAGES—FOR PRAIRIE CHICKEN, DUCK, GEE-E, AND BRANT SHOOTING. THE IOWA LINE TO-DAY OFFERS MORE FAVORABLE POINTS

than any other road in the country, while for Deer and Bear Hunting, and for Brook Trout, Lake Salmon, Pike, Pickerel, and Bass Fishing a hundred points on the Northern and Northwestern lines of this company will be found unsurpassed by any in the West.

FOR SALE, OR TO LET.

The elegant country residence, WILLOW LAKE, at Locust Valley, near Glen Cove, Long Island.

Suitable for Summer Boarding-House.

The house is 2½ stories, frame, 40 feet front and 52 feet deep, with wide piazza front, rear, and on south end. On first floor are parlors, sitting-room, and dining-room; wide hall through the centre. Up stairs are 9 bed-rooms, all large and airy; kitchen well-arranged and convenient; cellar large and dry.

On the premises, and at a convenient distance from the house, are a stable and carriage house, chicken-house, shed, coal, tool, and ice houses. The grounds are well laid out and tastefully planted with ornamental trees and shrubbery. The avenue leading from the road to the house skirts a beautiful lake, on the border of which the house stands. A Paper Mill at the north end of the lake will be sold with the above, subject to a lease. The lake and land embrace about 27 acres. As a place of residence it is elegant and healthy; for manufacturers it is convenient; for the propagation of trout, for pleasure or profit, there is no better place in the State. Apply to

BUY IT Vanity Fair.
It is shaved from the best Natural Leaf, for Meerschaum and Cigarettes. Does not make the tongue sore. Sample on receipt of 20 cents. Highest award, Vienna, 1873. Send for circular. WM. S. KIMBALL & CO.,
PEERLESS TOBACCO WORKS, Rochester, N. Y.

From Seth Green, Supt. N. Y. State Fisheries.
I find Vanity Fair to be the best article of tobacco adapted to the wants of the sportsman. Have used your tobaccos for many years, and know them all to be first-class.

For Sportsmen.
A trusty friend, in weariness or trouble; a solid resource in Winter and rough weather, is a sweet pipe with Vanity Fair. Best dealers have it.

From A. B. Lamberton, Rochester.
Having smoked your tobacco, Vanity Fair, by the camp fire and by the hearth, I believe it in point of fragrance and taste superior to all brands known to me. Being in search of a tobacco that would not fire the tongue and mouth, I was made acquainted with your Vanity Fair, and found it to be the *ne plus ultra* of natural leaf.

For Cigarettes.
A cigarette is an interlude to the serious habit; a graceful make-believe for spare hours. For cigarettes Vanity Fair has no equal. Best dealers have it.

From Forest and Stream, N. Y.
We have received from Messrs. Kimball & Co., of Rochester, some choice specimens of their celebrated Vanity Fair tobacco in neat metal cases holding a pound each; and, after most thorough trial, do not hesitate to concede to it all the good qualities which its manufacturers claim for it. It is a most superior article, and a great comfort to discriminating smokers.

THE
PAPER STEM PIPE.
Just the Thing for Home and Camp Use.
Supplies a want which smokers have long felt—a pipe which shall give simply the taste and odor of tobacco smoke. This pipe never accumulates rank smelling liquid in stem or bowl, but is always clean and sweet. The bowl and mouthpiece are permanent, but the stem is of porous paper, to be laid aside after a few days' use and a new one fitted. Extra stems accompany each pipe. The price of extra stems, when not furnished with the pipe, is as follows: Four and a half and seven inches, 5c.; twelve inches, 15c. Sold by pipe and cigar dealers generally, or a complete sample sent by mail for $1 by
J. H. Hubbard,
nov18 tf Selling Agent, Cambridge, Mass.

The Goss Revolving Cartridge Holder
CARRIES PAPER OR METALLIC SHELLS, either end up, revolves on centre slides, weighs but 1¼ pounds, and is only 1¼ inches wide. Holders dare set top so as to quickly receive the shells, and, being elastic, *securely* clasp the same.
For case of action and rapid shooting it excels anything of the kind invented.
PRICE, C. O. D., $6.50.
In ordering, give the size of shells and a *loose* measurement outside of vest.

Hazard's "Duck Shooting."
Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6¼ and 12½ lb. kegs. Burns *slowly* and very clean, shooting remarkably close, and with *great penetration*. For field, forest and water shooting it ranks any other brand, and it is equally serviceable for muzzle or breech loader.
Hazard's "Kentucky Rifle."
FFFG, FFG, and "Sea Shooting" FG, in kegs of 25 12½, and 6¼ lbs. and cans of 5 lbs. FFFG is also packed in 1 and ½ lb. canisters. Burns strong and *moist*. The FFFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard *Rifle* powder of the country.
SUPERIOR MINING AND BLASTING POWDER.
GOVERNMENT CANNON AND MUSKET POWDER; ALSO SPECIAL GRADES FOR EXPORT, OF ANY REQUIRED GRAIN OR PROOF MANUFACTURED TO ORDER.
The above can be had of dealers, or of the Company's agents in every prominent city, or wholesale at our office,
88 Wall Street, New York.

CELEBRATED
American Dogs.
Fine Engravings on card boards, ready for framing, of the following celebrated dogs:—
Pure Laverack Setter Pride of the Border.
Pure Laverack Setter Fairy.
Imported Red Irish Setters Dash and Bess.
Red Irish Setter Dick.
Celebrated Dogs Pog, Don, and George, after painting by Bispham.
Black Pointer Whisky.
Liver and White Pointer Ranger.
Black Pointer Pete.
Price 25 cents each, postage paid. Address
FOREST AND STREAM PUB. CO.,
17 CHATHAM STREET, N. Y.

Orange Sporting Powder.
ORANGE LIGHTNING POWDER,
The *strongest* and *cleanest* Powder made. Nos. 1 to 7, packed *only* in sealed 1 lb. canisters. The coarser sizes (higher numbers) especially are recommended to owners of fine breech-loading guns, giving great penetration with very slight recoil.
ORANGE DUCKING POWDER,
For water fowl. Very strong and clean. Nos. 1 to 5. Packed in metal kegs of 6¼ lbs. each, and in canisters of 1 and 5 lbs.
ORANGE RIFLE POWDER,
The best for rifles and for all ordinary purposes. Sizes F.g, FF.g, FFF.g, the last being the finest. Packed in wood and metal kegs of 25 lbs., 12½ lbs., and 6¼ lbs., and in canisters of 1 lb. and ½ lb.
All of the above give high velocities and less residuum than any other brands made.
BLASTING, MINING, AND SHIPPING POWDER OF ALL GRADES AND SIZES PACKED IN WOOD OR METAL KEGS OF 25 LBS.
SAFETY FUSE AND ELECTRICAL BLASTING APPARATUS.
LAFLIN & RAND POWDER Co.,
21 Park Row, N. Y.
Sole proprietors and manufacturers of the celebrated ORANGE brand of GUNPOWDER. Recommended and used by Capt. A. H. BOGARDUS, the "Champion Wing Shot of the World."

CHALLENGE.
The undersigned is prepared to prove all the superior qualities he claims for his powder.
Safety, Cleanliness, Strength, Little Recoil, Little Smoke, Small Report, Less Heating of the Barrel in Rapid Firing, and its Regularity in Shooting.
He challenges all riflemen to shoot against him with black powder, 200 rounds, without wiping; 100 rounds off-hand, at 200, 500 and 1,000 yards respectively, and 100 rounds in any position at same distances; the 200 rounds equally divided at the three ranges; sighting shots extra.
Will shoot for money if desired.
The powder is also well adapted for shot guns.
Inquire for the "Dittmar Powder" of your dealer, or address the
DITTMAR POWDER MANF'G CO.,
NEPONSET, MASS.

PISCICULTURE.
The West Barnstable (Mass.) Hatching Works are offered for sale. The various ponds and tanks are abundantly fed by springs unvarying in temperature. Six acres of land, dwelling house, a large ice-house, etc., etc., within five minutes' walk of the depot. Three thousand adult trout, and 20,000 fry of this years' hatching. A more complete establishment is not to be found in the country. It received the first prize of $300 from the Massachusetts Agricultural Society in 1872, and a medal from the Societe d' Acclimation, of Paris, in 1873, for "Excellent Fish Farm." Apply to

Paper and Metallic Shells
FOR
Breech Loading Shot Guns,
Manufactured by the
UNION METALLIC CARTRIDGE CO.,
BRIDGEPORT, CONN.

THE STURTEVANT SHELLS are the easiest reloaded. Do not have to unscrew the head nor use an awl to remove the exploded caps. THE PATENT MOVABLE ANVILS, made of steel wire, will not bend or break.

THE BERDAN PATENT SHELLS, new model, with Hobbs' patent waterproof primers, never miss fire, and are highly prized by all that have used them.

PAPER SHELLS.—By repeated experiments and great outlay for improved materials, and machinery made expressly for the purpose, we can now warrant our BROWN PAPER SHELLS equal to any imported. They are sure fire, and will not burst in the gun.

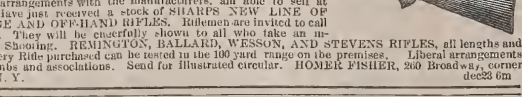
Inquire of any of the dealers in sporting materials for the U. M. C. Co.'s Shells.

Not sold at retail by the manufacturers. dec23 tf

Hart's Sportsman's Favorite Metallic Shells for Breech Loading Shot Guns.

These Shells are easily loaded, and the caps easily extracted from inside. Head solid, and much thicker than any shell now made, giving a solid seat for cone or anvil, which prevents it from driving through or springing away, thereby causing misfires. The cone is made of nickle and fastened solid in its place. It neither rusts or corrodes fast like moveable anvil made of steel. The nickle cone also prevents misfire when cap has been left on shell for a few days, which is liable to occur either in steel or iron. These shells are finely finished, and made any length ordered, from 2½ to 3½ inches.

Shells and Loaders, and description Price Lists, can be obtained from all the leading sportsmen's houses throughout the country. GEO. E. HART & CO., 263 and 265 Market st., Newark, N. J.



From Captain Bogardus, Champion Wing Shot of America.

MESSRS. GEORGE E. HART & CO.,

Gentlemen—The fifty shells I received from you to-day suit me better than any I have ever used. They are stronger and better in every respect, and I shall use them in all my shooting hereafter. Yours truly,
A. H. BOGARDUS.
may13-1y

I have now in stock a complete assortment of Rifles of all well known and reliable makers, and having made special arrangements with the manufacturers, am able to sell at their prices. Have just received a stock of SHARPS' NEW LINE OF LONG RANGE AND OFF-HAND RIFLES. Riflemen are invited to call and examine. They will be cheerfully shown to all who take an interest in Rifle Shooting. REMINGTON, BALLARD, WESSON, AND STEVENS RIFLES, all lengths and calibre. Every Rifle purchased can be tested in the 100 yard range on the premises. Liberal arrangements made with clubs and associations. Send for illustrated circular. CHAMPION GUNS OF ENGLAND
PAPE'S
Unrivalled Sporting Guns.

Stand uncqualled in every contest. Their performance at the London Trials of 1875 beats the records of any maker in the world.

1875. 12-Gauge, Choke Boring.

Maker of Gun,	Exhibitor.
1st—Greener	Greener.
2d—Pape	Davidson.
3d—Pape	Pape.

Out of a class of 63 guns, 3 out of the 6 best were made by Pape. The Greener gun was protested against on the spot for having its score false counted, the fact proven there, and afterwards confirmed by same gun being shot for two days per week for six weeks in succession, when its average score only took 24th place, its very best score being greatly below the scores of the best six guns.

1875. 12-Gauge, Old Sporting Bore.

Maker of Gun.	Exhibitor.
1st—Pape	Davidson.
2d—Pape	Davidson.

1875. Long Range, 60 yards, Choke Bores.
1st—Pape ..... Davidson
60 yards, Long Range, Sporting Boring.
1st—Pape ..... Davidson

Those champion Long Range guns, only 7 pound weight, with a charge of 3¼ dr. to 1¼ oz. shot, beat the best 8 bore Greener gun at 60 yards; weight, 15 lbs.; 6 drachms and 2¼ oz. shot.

1875. The Sportsman's Sub. Cup, valued at £45, was also awarded to W. R. Pape, for the original invention of choke boring. Winner of the London Gun Trials of 1858, 1859, 1866. Address

THE GREAT
London Gun Trial,
1875.

W. W. GREENER'S
Far-Killing Prize Guns.

Winner of Silver Cup, value 40 guineas. Winner in Class 1, for 8 and 10 bores. Winner in Class 4, for 39 bores. Winner in the Weer and Tear Trials, July, 1875. 2,500 shots fired without deterioration.

W. W. G. is the only maker who has made an average pattern of 214 shots in a 30-inch circle, at 40 yards, with a 12-bore gun, at any public trial either in England or America.

I have just received a consignment of these guns, and shall offer to individual sportsmen, for a short time, an opportunity to secure one of these celebrated guns at a popular price, viz: $75, gold; extra for extreme close shooting, $10. This will probably be the last chance to secure one of these guns at these very low figures. All grades and styles in stock or imported to order.

Attention is also called to my stock of guns, by W. & C. Scott & Sons, which includes all their latest improvements. No old style guns in stock.

Sole New York Agent for Holabird's Hunting and Fishing Suits. Trade supplied.

214 W. Pratt st., Baltimore.

WILLIAMS & POWELL,
Gun and Rifle Manufacturers,
Call the attention of the Sportsmen of America to the extreme SIMPLICITY, STRENTH and DURABILITY of their New Patent "SIMPLEX" Breech loader and INDEPENDENT EXTRACTOR.

The parts in this new action are so few (only two,) its mechanical soundness so thorough, and the strength and simplicity of the action so great, that W. & P. feel sure it will supersede all the complicated and manifold grips now in use, its one powerful grip being far stronger than any double, treble or quadruple grip now used. In this new action LEVER and GRIP ARE ONE SOLID PIECE OF STEEL, and the ANGLE of the BODY is left in its ENTIRE STRENGTH.

Drawings of action and extractor will be sent on application, and orders may be forwarded through any of the best houses in the States for execution in the Spring.

Guns guaranteed to make patterns of from 160 to 230 with No. 6 SHOT AT 40 YARDS, as desired.

NO. 25 SOUTH CASTLE STREET,

NOW READY.

THE ORVIS REEL.

NO 1.—This Reel is extra nickel-plated and finely finished. Is perforated to make it light, and keep it free from sand, also that the line may dry without removing it from the reel after use. Has a very perfect click. It is very light, very strong, and holds from 40 to 50 yards of line. It is more compact and less cumbersome than ordinary 20 yard reels. It is quite narrow, and takes up line rapidly. Put up in neat Black Walnut case, price $5.

NO. 2—For Prizes. Same style as No. 1. Heavy Gold Plate. Extra finish, with case, price $10.

Sent by mail, postage prepaid, on receipt of price, or by express, C. O. D. LIBERAL DISCOUNT TO THE TRADE. Send for Price List of Fishing Rods and Reels. Mention this paper.

POPE'S

Rifle Air Pistol,

FOR TARGET PRACTICE.

Just the thing for sportsmen and military men. Shoots darts or slugs a distance of 50 feet. Perfectly accurate. By practicing with it one may become a dead shot. Each pistol is put up in a neat box, with 6 darts, 6 targets, 100 slugs, ramrod, claw wrench, and skeletoo gan stock. Price, $5; nickel plated, $6. Sent by mail on receipt of price and 35 cents postage.

One of the many testimonials from the Commander-in-Chief of the U. S. Army:—

"It is sorely ingenious in mechaoism, quite accurate in aim, and useful to preparing one for the more serious handling of the ordinary rifle.

W. T. SHERMAN, General."

POPE MANUFACTURING CO.,
Feb10tf 45 High Street, Boston.

ENGLISH SPORTING GUNPOWDER.

Curtis & Harvey's DIAMOND GRAIN.

Nos. 2, 3, 4, 5, 6, 7, and 8 Superior Rifle, and Col. Hawker's Ducking.

W. STITT, 61 Cedar street, New York,
sep9-eow Agent for U. S. America.

HAVANA LOTTERY.

IMPORTANT NOTICE.

For the coming drawiogs, commencing January 5th, we have reduced the prices of tickets as follows:

Whole, $20; ½, $10; ¼, $5; 1-5, $4; 1-10, $2; 1-20 $1.

Drawiags take place every seventeen Days.

We are prepared to fill all orders. Circulars sent upon application. Highest price paid for Spanish Bank bills, Governments, &c.

BREECH LOADING GUNS

A SPECIALTY.

AGENTS

for the following celebrated makers:

W. & C. SCOTT & SONS (winners at the International Gun Trial of 1873); J. P. CLABROUGH & BRO.; P. WEBLEY & SONS, and WESTLEY RICHARDS.

HOLABIRD'S Shooting SUITS,

DIXONS & HAWKSLEY'S SHOOTING TACKLE

STURTEVANT BRASS SHOT SHELLS,

BUSSEY'S PATENT GYRO PIGEON AND TRAP WITH CASE, AND 100 BIRDS.

Black's Patent Cartridge Vest.

This Vest affords the best arrangement yet invented for carrying cartridges. The weight is so evenly distributed that it is scarcely felt. Cartridges can be carried with the *heads downs* in this vest, which is of great importance when brass shells are used, as when carrying them with the head up the weight of the shot often forces the wad forward, when bad shooting is the result. In ordering send measurement around the chest.

PRICE $7.50.

AGENTS FOR THE

Union Metallic Cartridge Company's Ammunition,

WARRANTED THE BEST IN THE MARKET.

HUNTING THE OSTRICH.

BY ISAAC MCLELLAN.

THE mounted tribesmen gather far,
From wattled hut and herdsman's kraal,
To follow over grassy plain
The noble ostrich on his trail.
Some mount the wild, impatient steed,
And some a-foot essay the chase
With slender spear and poison'd shaft,
All ambush'd in some lonely place.

Fast by some fount, like diamond glen
Dropp'd in the desert's fenceless bound,
Amid the water-reeds they lie,
Outstretch'd upon the marshy ground,
Knowing the ostrich there will come,
Hard press'd by hunter and by steed,
To seek the water-courses lone
For drink and shelter in their need.

Far, far the spurring horsemen ride,
With savage whoop and ringing shout,
Far, far the panic-stricken flock
Flies onward in tumultuous rout;
Their black bill and their slender neck
Before them point the unerring way,
Their nervous legs and flapping wings
Ply ceaseless o'er the grassy vley,
And long and weary must the chase
Be lengthen'd o'er the desert space.

The savage far and wide will ride
To win the precious, fleeing prize,
Gazing before him at those plumes
That captivate his greedy eyes;
For Sheik is shorn of half his pomp,
If grac'd not with his feather'd crown,
The waving ostrich plumes that twine
His brow, with their imperial down.

And oh! what sweet young maiden brows
With golden curl or raven tress,
In other lands beyond the seas
Those ostrich wonders shall caress;
In royal courts, in palaces,
Where queens and nobles grace the ball,
And lucent pearls and diamonds shine
Resplendent in the sumptuous hall;
How will the blazing lights illume
That floating, foam-like Afric plume,
So purely white, so peerless fair,
Drifting, like snow flake, in the air.

For Forest and Stream.

Labrador and the St. Lawrence.

Notes of a Trip to the Fishing Posts on the Labrador Coast and Visits to the Light Houses, &c., in the Gulf of St. Lawrence and Straits of Belleisle.

BY J. U. GREGORY, OF QUEBEC.

(Continued from Last Week.)

I VISITED over thirty fishing localities, some of the inhabitants of which were in very distressed condition. One case, that of the Joueses, will convey to you some idea of the others. Wednesday after breakfast I went on shore, where I found a few fishermen connected with a large trading establishment there to collect fish and load vessels for the firm at Jersey (one of the British Channel Islands). My first inquiry was for the Joueses. I learned that they lived at Bradore Bay, eight or nine miles off, and that I could not reach it in a boat, owing to the heavy sea which would prevent our rounding a long and dangerous point, but that I could do so by land, with the aid of a guide, by traveling over the mountains. Mr. Duhamel, the late East Point lighthouse keeper, volunteered to accompany me. Dressing warm, but as light as possible, and with a pair of Esquimaux seal skin boots on, and our pockets filled with crackers, we started at early morning with our guide, a fisherman from St. Malo, France. Owing to the soft spongy moss, and the day pleasantly cold, we traveled fast. Our talkative French guide pointed out to us the small creek which is supposed to divide Labrador here between Canada and the Newfoundland district, and giving us much other information. When we were about five miles on our way we saw coming towards us a tall, dark-complexioned man about forty years of age, dressed in canvas, a tarpaulin hat, and raw seal skin slippers. Our guide called him by name, and I found it was poor Jones himself, who was on his way to the bay to try to get something to prevent his family from starving. His haggard, shivering appearance denoted suffering and want. I went up and extended my hand to him, which he politely took, and answered my common-place questions with intelligence and courtesy. I requested him to turn back as I wished to visit his establishment, not letting him nor the guide know why I did so. He answered that it was a poor place to visit, his fishing had failed for so many years that he was now very poor, and he supposed I knew enough of Labrador to understand that fishing was his only source of living. At one time the family were in a condition to entertain gentlemen, and the son of the Chief Justice, the late Col. A. H. Bowers, had spent some time on a visit to them. I gradually led him on to speak of his prospects, which appeared very discouraging indeed. I asked him whether he would not like to leave the coast with his family, and go to some place where the earning of a living was more a certainty. He answered that he was born on the spot; had never left it, and never would; that he was unfit for any other life; besides he had the best seal fishing station in the neighborhood; in former times his father was considered a wealthy man, often making $6,000 to $8,000 per season, but had saved nothing. From a prevalence of westwardly winds his bay became so blocked up with ice at the seal fishing season, which only lasts a few days, that he could not set his nets, every season for some years bringing no better luck. His father and mother went away leaving the fishing to himself and brothers, but they soon got discouraged and also left. His parents died somewhere near Quebec; he being the last would never forsake the old spot. I told him that I could manage it in such a way that it would cost him nothing to do so if he would consent to leave, but he would not, he loves the old place, and has great hopes of soon meeting better success. He related an instance of another fisherman similarly situated, who had caught no seals for some time, but by a sudden change of the wind his bay was cleared of ice, nets were hurriedly set, and in two hours and a half over 500 seals were captured, each seal being worth $4. The wind again changing, the bay was soon blocked up with ice, and he caught no more that season. Poor Jones hopes for some such luck. We soon came in sight of his house, a large wooden building in a very dilapidated condition. All the materials used in its construction had been brought down in schooners from Quebec. He said that this was his summer house. He has another smaller one in the interior, nearer wood. Most of the fishermen have two houses. One on the island near where they carry on fishing, the other on the main land, better sheltered, and to which it is more convenient to haul fuel, which is only found far back in the ravine, from whence they bring it on sledges drawn by dogs. When we reached the house I perceived that many panes of window glass were broken. After he had tied up a half-starved wolfish dog, which he said was vicious to strangers, we went in by the back door through the kitchen. The flooring had been pulled up in many places; seeing that I noticed this, he stopped to explain the reason, and said that last spring, during cold weather, having moved there to be ready to begin fishing operations, he was so weak from want of food, that he had not strength enough to go for wood, and was obliged to burn the floor to prevent his family from perishing from cold. Looking around I found the partitions had been painted in imitation of oak. We walked on till we came to the passage, on each side of which I could see the rooms through the open door, the floors were painted in squares, and on the walls of the principal rooms were the remains of costly paper, representing hunting scenes nearly half life size. There was no furniture in any, excepting one. In this was a stove, bench, table, and large bundle of nets. We were invited to enter it, and did so. I asked Jones to allow me to see his wife and children. He answered they were hardly sufficiently clothed to be seen by any one, but he would go up stairs and try and induce them to come down. After some time I heard some person coming down the stairs, apparently laboring under a distressing cough. It was his wife, followed by five of his daughters, at ages varying from three to twelve years. Mrs. Jones was dressed with a very thin faded cotton jacket, and a skirt made of an old boat sail, but perfectly clean. She had neither shoes nor stockings. She made me a polite bow, and stood up near the stove until we insisted she should take the only seat, while we took two nets for the same purpose. What a sad face! Want and suffering were plainly marked in it, as well as her emaciated body. She had evidently been very handsome, and fair and rosy in her younger and happier days. She was thirty-six to forty years of age, and told me she was Scotch and born in Glasgow. She came out to Halifax to visit a sister who was governess in a gentleman's family. Some time after Jones' brother married that sister, and she came over to Labrador with them, where she met and married her husband. They were then considered rich, and lived in plenty for some years after. But what a change has taken place since! Starvation frequently stares them in the face, and she had become very sickly in consequence. They have nine children, the eldest a girl of sixteen, the next a boy of about fourteen, both of whom were then away with a gun, and their last charge of powder, trying to kill the largest bird they could find to furnish a meal for the family. They had been living for many days on nothing but small trout caught by the children in a fresh water stream not far off. They had neither pork, grease, nor butter of any kind, or other article of nourishment; in fact, nothing had entered their stomachs but fish and water. The poor children were very thin and nearly naked, none had worn shoes for a long time, winter or summer. I asked Jones whether he could not make some sort of covering for their feet with seal skin. He answered yes, but they needed food first, and a seal skin could be traded for some sea biscuit, and prevent them starving. Mrs. Jones said it would soon be over, for they could not live through such a winter as the last. I told her that on the way to the house I had spoken to her husband about leaving that unfortunate place, and asked her to try and persuade him to do so at once. She turned her large, sad consumptive eyes kindly upon him, and said, "whatever he thinks best to do I will consent to." Looking around upon the poor hungry children, Mr. Duhamel and I sprang up off the nets and distributed the crackers among them by hands full. I never will forget with what avidity they devoured them. Turning to Jones, I said, "Come now, Mr. Jones, get all your things together, I will give you time to do so, and provide you and your family with a free passage to some place where you will most likely find work for yourself and your son, and where you can bring up your family to a new life, and in your troubles find kind neighbors willing and able to help you. This is no place to settle with such a fine family, especially with so many girls. What prospects have your children in life? Do you wish to see your daughters married to men as poor as yourself, and again going over the life of suffering you are now passing through?" "God forbid," he answered, "I would do anything to improve their condition, but I am unfit for any other life than that of a fisherman, and will not forsake the old spot yet." I learned that last season, not being able to obtain wherewith to begin fishing, he agreed with some parties, if they would furnish him with an outfit and a small quantity of provisions for his family, he would give them the privilege of fishing in his bay, himself and son to help, and take one-third of the catch for pay. His share was fifteen seals, valued at $60, and did not cover his indebtedness to his partners. The seal carcasses he salted down for food for his dogs for the winter, but they had been forced to eat most of them themselves. This meat, I am told, is oily and tough, and most difficult to di-

gest, and made his family sick. One little girl, however, could manage to eat it better than the others, and would cut off a slice, freshen it, lay it on the stove to warm, and eat it without a murmur. This child he called "Hard Times." He showed me his account with the traders to whom he was in debt. There were no other items but those of flour and sea biscuit, and a few nails, twine, and thread; no pork, tea, sugar nor tobacco. They charged him $15 per barrel for coarse flour, $9 per cwt. for common sailors' biscuit, and 15 cents per pound for nails. This unfortunate family had traded off for food all their furniture, little by little, and even the feathers out of their beds. Jones asked us to step outside and he would show us his bay, and describe the mode of catching seals; in doing so we passed a small lot which had once been inclosed as the burying ground of the family, in which were three or four handsome marble tombstones, marking the last resting place of some of the family who had died surrounded with comfort. "I greatly feared," said he, speaking of them, "that several more graves would have been added to the number last winter, or may before this spring, but there will be no marble tombstones to mark them." From an elevation he pointed out to me the bay, shaped like a horseshoe, in which in former days so many seals were caught, and told me from the spot we were then standing upon, last spring when his family were starving, he had seen hundreds of seals, but they were too far off, and their sight only made his condition more desperate. From what I could learn, old and young seals, at the time when they are in the best condition to yield oil, seek open water, and delight in getting near the shore, and congregate in large numbers in sheltered bays. The fishermen attach one end of their long nets (made of cord about the thickness of a lead pencil) to a capstan at one side of the bay, and with a boat go out as far as it will reach, and gradually work around to the other side, where another capstan is placed, and that end of the net is made fast to it. The men wind in the net on both capstans, and as soon as the seals find themselves caught they dive and endeavor to make for deeper water, run their heads into the meshes of the nets, pushing forward with all their strength, and never draw back. Most of them are thus strangled. Any remaining alive are drawn in as near shore as possible, and dispatched by the men with clubs. Jones had serviceable nets, and a couple of boats, and was otherwise fitted out to catch seals if the season should prove favorable. As it was getting late, and we had a long walk before us, and wishing to visit other families, we again entered the house to bid his family good-bye. I told Mrs. Jones that I saw very well that her husband would not leave the bay, and supposed he was the best judge of whether he should do so or not, and that I sincerely hoped their condition would soon change for the better, and that next time I should visit Bradore Bay I would find them surrounded with comfort and happiness. "Thank you sir," she answered, "for your encouraging words and visit. I hope your good wishes may be realized." I had not us yet said a word about leaving them any provisions, and felt the words which would inform them of such joyful news leaping to my mouth. I told her that I must return to Blanc Sablon, and if her husband would come with me I would leave with him sufficient food, and anything else I could obtain to keep them through the long winter so near at hand; to take courage and heaven would reward her for her patience under such trying circumstances. Tears of joy soon streamed down her cheeks, and blessings were showered upon those who were about saving them from starvation. I then told her of the generosity of the Government in sending me down to inquire into their condition, and relieve their distress. I shall never forget the looks of that grateful face. A silent shake of the hands, for no one could speak, and beckoning Jones to follow, we left that house of suffering to hasten to send them the promised relief. Poor Jones became quite gay, and said so many things in an absent-minded way that he asked me to excuse his manners for the past hour had so changed his prospects for the winter that he was quite beside himself, and did not know what he was saying.

We diverged some distance from our road back to visit two other families, who were better off in clothing, but short of provisions for the winter. I supplied them also. At 7 o'clock in the evening we reached Blanc Sablon Bay. I requested Jones to wait at the house on the beach for the articles I should send him ashore. A signal brought the boat for my companion and self, and we were soon on the steamer's deck, tired and hungry after our eighteen or twenty miles' tramp without food. We had hardly got on board before the wind, which had been threatening for some time, sprang up and so rapidly increased to a fearful gale that it was impossible to launch a boat with the supplies, and poor Jones had to wait till the morning. At an early hour the steward knocked at my room door and informed me that the wind had abated, and there was a man on deck who wished to see me. I jumped up at once. When I reached the fore part of the steamer, there stood poor shivering Jones, who had borrowed a small boat and rowed out to us with the fear, no doubt, that something might prevent his great hopes from being realized. When our kind-hearted captain and engineer saw him tears dropped from their manly eyes, for I had related to them the condition I had found himself and family in, and his haggard, half-clad, and anxious appearance fully corroborated all I had told them. Mr. and Miss. Smith gave me some articles of clothing, the latter a dress or two for Mrs. Jones, and Mr. Duhamel having them on board belonging to his wife and children, also contributed several useful articles of female apparel. I was able to procure from among the crew some second-hand boots, socks, coats, flannel shirts, pants, mittens, caps, etc., and also added a quantity of powder, shot, gun caps, some tobacco and pipes, matches, and tea and sugar for poor Mrs. Jones. These were all made up into a bundle, covered with three good warm blankets, and left in the cabin. I again went on deck to see Jones, whom I found seated at the breakfast table in the officer's mess room. Before him were placed ham and eggs, bread and butter, potatoes, and a cup of hot coffee. I told him to make a good breakfast. "I can't sir," he answered; "when I put a morsel of this kind of food to my mouth, I think of my poor family with nothing to eat, and my appetite leaves me." I said all I could to encourage him to make a hearty meal, but he soon left the table, evidently anxious to get home with something for his wife and children. The boat was manned by five sailors, several barrels of flour, Indian meal, peas and pork sufficient to carry them through a Labrador winter was put in Jones' bundle crowned the load, among which were also a few barrels for the other families, and Jones seated on one of the barrels was rowed ashore. The thanks and blessing of that poor man still ring in my ears. I would have given a good deal to have been hidden in some corner when he arrived home with his boat load of supplies, and that bundle opened. Jones is a good hunter, and being provided with powder and shot, (he has a gun), and some warm clothing, will be able to go some distance over the mountains, where he will find caribou, or other game which will greatly assist them.

At Blanc Sablon Bay I was obliged to help several other families with flour and meal as they were very badly off. Their cod-fish and herring, as well as seal fishing had almost entirely failed, they had, in fact, been able to only provide about half enough provisions to last the long winter. It is a sad sight to see strong, brave fellows, perfectly temperate in habit, whose lives are constantly exposed to great hardship and danger in the pursuit of the fisheries broken down with disappointment after the season is over, with a hard winter rapidly approaching and no resources whatever to stave off starvation. Yet such is the life these people lead, and they will not give it up. I have known several instances where some of them became so disheartened that they came up to Quebec, or other places with their families, never intending to return, but before two years they went back again. They are unable to compete with ordinary laborers for work, and long to be again living their old independent life on the coast, buoying themselves up with the hopes of a successful season's fishing, which when really good is very soon over, and they then have eight to nine months comparative idleness till spring. I am happy to state that nowhere on the coast did I hear of distress being due to the use of liquor. I believe there is none to be had. The trading schooners bring down flour, pork, tea, sugar, molasses, tobacco, salt, dry goods, clothing, trinkets, fiddles and German accordeons, and concertinas. You can hardly find a hut but what boast of its concertina, and the airs played are very simple, and generally jigs, which upon some of these cracked instruments, especially when accompanied by that horrid tremolo, are perfectly unbearable. I much prefer the fiddle, for this instrument seems better adapted to their style of music.

On Tuesday the 15th October we left for Bonne Esperance, where we arrived at 2 o'clock in the afternoon, and cast anchor in a fine harbor among the islands. A very neat white barge about twenty-four feet long, pointed at each end like a whale boat, carrying two masts, with sails, soon made its appearance. The flag at the mast head was recognized by the Rev. Mr. Butler as that of a missionary. Upon its arrival alongside of the steamer we greeted the Rev. Mr. Wainright, Church of England missionary at St. Augustin, who, accompanied by an Esquimaux Indian and fisherman, had sailed down to Bonne Esperance in hopes of hearing of some Government assistance being sent to the people in his district. We were now within nine miles of the Rev. Mr. Butler's mission house, and Mr. Wainright kindly volunteered to sail us up to it in his barge. Hearing that there was a lady there, Miss Smith accepted his invitation to visit her. We arrived at the end of our sail, Salmon Bay, at the entrance of Esquimaux River, at 5 o'clock, and the Rev. Mr. Wainright carried us ashore on his back. My weight being over two hundred pounds tried his strength, but he tottered on, and landed me all right. He was the only one provided with long waterproof boots. The bell of the little chapel was rung, flag hoisted, and hurrahs greeted the return of the missionary. We paid a short visit to this chapel in the wilderness, which is little more than a large log cabin, then entered the house where we were hospitably received by a Montreal lady, Miss Baylis, a member of the Congregational Church, who volunteered her services on this bleak coast two years previous to our visit to teach the poor fishermen's children, and aid in carrying out the work of the mission, and has been there since. The house is a simple log building divided into rooms. A quantity of deals were washed ashore last summer, supposed to have belonged to some wreck, and afforded material for making a porch, which rather improves the appearance of the building. There were several girls boarding and attending the school, which numbers from thirty to forty children. The missionary also visits around, teaching the Gospel over a wide district of more than a hundred miles in summer in boats, and in winter on kommeticks, or sledges, drawn by dogs. They also supply medicine and doctor the sick, set bones, draw teeth, and do a variety of other useful things to assist the people, frequently greatly stinting themselves by dividing their provisions with the starving fishermen. Around the mission house there are eight or ten families, all very poor from the failure of the codfish and herring fisheries. Accompanied by Mr. Butler I visited them, and inquired thoroughly into their condition, and apportioned out provisions according to the number in each family, which were left the next day in charge of the principal person at Bonne Esperance, the nearest point. We spent a pleasant evening at the mission house, and next morning at an early hour left for the steamer. We were overtaken by heavy rain, and reached the Napoleon thoroughly wet through. The supplies intended for the people were handed over to a Mr. Whitely, with a list of the quantity to be allowed each person, under Mr. Butler's supervision.

On the 18th October (Sunday) we reached Cumberland harbor, and at 8 o'clock loaded two boats with supplies for one portion of Mr. Wainright's district, nine miles off, and in the afternoon sent two more loads as far in another direction, which were left in charge of proper persons to be distributed by him. I visited the people, and found them as badly off as those I had already seen, but nowhere else on the coast did I meet such utter distress as at the Joneses. The weather was now very cold, and snowing hard. In the evening Mr. Wainright delivered an excellent sermon, with appropriate prayers, on board the steamer. He is just the man for a missionary, kind hearted, always ready to assist any one, a good bone setter, surgeon, physician, and pilot, his services are constantly in requisition in some of these capacities, and he is often sent for from distances of from fifty to one hundred miles. He has a small chapel at St. Augustin, where he resides with his family, his only neighbors being the Hudson Bay Company's agent, and four or five fishermen and their families.

From Cumberland harbor we went to Great Meccatina Island, where we anchored in its fine sheltered bay. Having learned from Mr. Samuel Gaumond, a young and very intelligent fisherman, that the people in the neighborhood had done pretty well, and were not in as destitute condition as those we had already visited, and consequently little assistance necessary. I left in charge sufficient to supply some poor families at Bay des Mouton and Bay Platte, which I had been unable to visit. Owing to a dense fog we remained nearly two days at this place, during which time I walked all round the island, and saw a good many seals, which were too shy to get a shot at. I shot a young loon, which was eaten on board, and pronounced very good. While at Gaumond's house he harnessed five of his fourteen dogs to a kommetick, a novel sight to me. The dogs acted as sporting dogs will when they see their master take a gun. Their delight when shown their harness was very marked. The kommetick is a narrow sledge about nine feet long and two and a half broad, the runners are low and pointed in front, and shod with whalebone. Instead of an ordinary bottom narrow cross pieces about three inches wide are fastened to the top of the runners with strings of seal skin. After shutting up all the dogs, excepting the five to be harnessed, Gaumond called up the leader, a fine, straight-eared, short-haired black dog with a large white-tipped tail, his harness consisting of strips of seal skin decorated with bits of colored cloth, was put on. From the back of the harness is a seal skin trace about sixty feet long, this was attached to the front of the sledge. The next dog was harnessed just the same, but his trace was some twenty feet shorter than the leader's. The next dog's trace being about three feet shorter than that of the second, and so on till the last, each dog being harnessed and traced independent of the others. When all five were attached to the sledge Gaumond asked me to get on. I did so, when by his shouting some Esquimaux words the dogs placed themselves one after the other, an another unintelligible word, to me, started them off at full speed over rocks and up a steep hill howling like wolves, which they resemble. At the top of the hill a word stopped them, when Gaumond ran the sharp points of the sledge, after turning it over for the purpose, into the ground and anchored the dogs so they could not start till all was ready. He then asked me to get on again, but I had enough of the ride up hill, and did not like the idea of going down by the same conveyance. The dogs were again talked to in Esquimaux, and all got ready, at the word off they started at a breakneck speed down hill. Gaumond's hat flying off, and his hair streaming in the wind. I expected every second to see him tossed over some rock, but he arrived safe at the house, and the dogs were again let loose. The lash of the whip used by these people is from forty to sixty feet long, the handle not more than a foot long. Very few persons can manage this whip. It is necessary to be of this length for two reasons, first to reach the leader, and secondly to keep at a respectful distance any dogs they may meet with when traveling. A snap from it sounds like the report of a rifle, and will set a pack of dogs trembling in every limb. We had a meal at Mr. Gaumond's, which consisted of pork and potatoes, tea sweetened with molasses, and a tremendous Labrador pie, made of small cranberries all covered with molasses, of course. In the evening some of the crew of the steamer came ashore and amused their host with yarns; a fiddle was brought out, and the jigs played were very gay, the players keeping time with both heels, which is a style of beating peculiar to the Labrador musicians; the everlasting concertina was also brought into play, and its tremulous sounds mixed up with those of the fiddle, and the laughter of the party were wafted upon the breeze, and reached our cars on board the steamer far into the night. Mr. Gaumond is a young man, at that time aged about 21, and his wife but 18 years old. They had a good season's fishing, having caught some 300 seals, with herrings and cod-fish. He is very comfortably housed, and employs four men on shares. There is another fisherman on the same island nearly as well off.

Before proceeding further with my notes I shall sum up the conclusions we arrived at of the prospects of the fishermen between Blanc Sablon and Maccattina, and a district covering about 200 miles of the coast. The inhabitants number about 500 souls; of this number about 200 are able-bodied males; they are in part natives of Jersey, Newfoundland, Canadian and Acadian French, and a few Esquimaux Indians. Owing to the immense number of islands every family occupies one island. Each island, of course, has a name, and instead of the names of places on the coast one reads of representing a small village, you find but one or two families. One is astonished that people could think of making a home on such barren spots; not a potatoe or other vegetable will grow, fish and only fish is what these people must depend upon, and when the fish do not come to their very doors their fishing has failed. At one time these points were, no doubt, very good fishing posts, and were taken possession of by the proprietors for the purpose of keeping them for themselves. These people brought their families and settled there; they fished there, and large fleets of schooners also came for the same purpose. Whether from over fishing, or other cause, for some years past the fish seem to have almost forsaken them. The poor fisherman expecting every year to be better than the last has grown poorer and poorer; his boats and nets are old, and he has no means to replace them. Government has on several occasions sent aid, which has been very gratefully received, and the missionaries have divided their last barrel of flour to help to keep them alive. The Government of the Province of Quebec wishing to do something to improve their condition intrusted me with a mission to visit the coast to distribute aid for the last time, and to take away any families who would leave. From the liberal quantity of funds furnished I was enabled to put on board the steamer a large supply, and while positively warning the people that they would receive no further assistance, I at the same time strongly recommended them to leave and go to some place on the Intercolonial Railroad, where work would be plenty and they could cultivate land. I gave each family requiring it a liberal supply to carry them through the winter, with the understanding that it was to help them to save whatever earnings they might make to get away with, and offered to take any away at once, but they wished to make another trial. I greatly fear that few will ever leave, they like the life they lead with all its hardships and dangers, and look to their missionaries to help them in time of want. When they do catch a few fish they are entirely at the mercy of the traders, who go down in schooners to traffic; they usually allow from $2.50 to $3 a barrel for herrings; $3 to $3 a cwt. for cod-fish; 40 cents to 50 cents per gallon for oil, and in exchange charge $12 to $15 a barrel for common flour, and everything else in proportion. Latterly the traders, excepting three or four, have passed by the district between Maccattina and Blanc Sablon, there being so little to be done. The winter sets in early, and ends so little to be done. The winter sets in early, and ends late—eight or nine months of snow and ice. During this time there is no communication with any other part of the world. The people make long trips over the mountains with their dogs and kommeticks for the stunted spruce for

fuel. Each family keeps from five to fifteen dogs, during winter they travel a good deal. There are no hotels nor inns, consequently a poor man who has the misfortune to live on the line of travel has his house often full. I am told that it is nothing extraordinary for five or six travelers to put up at the same house, and at the same time, each having from eight to nine dogs, and fine music these brutes make at night. Many of the people are capital fishermen. If they would only take their families away to some place where they could cultivate land, and, instead of fishing by themselves, club together with parties who have schooners and seines, and follow the coast till they strike in upon the fish, every man to share according to agreement, they could do better, and could get their flour from Quebec at from $6 to $7 per barrel instead of paying traders $12 to $15, and they would sell their herrings at $4 to $5, and sometimes $6, instead of $2 to $3, and other fish at same rates, while the vessel owners would only pay according to the catch. This I believe to be the only plan for the Labrador fishing to be carried on profitably, for even at the exhorbitant prices traders sell, few of them prosper, as they are obliged to make advances, and when a fisherman can't pay, or won't pay, there is nothing to be done but grin and bear it. I am very much surprised that our Quebec merchants have not fitted out vessels on shares. The United States people do so, and with good results. You see hundreds of Yankees fishing, but you don't catch a Yankee living on the coast. Between Blanc Sablon and Maccattina, I believe, not one fishing schooner is owned. Consequently, when fish take a fancy to visit this district the poor fishermen, with their old boats and nets, do the best they can; but when fish do not visit it, or stop, as frequently happens, only for a few hours, they are in a sad state. I pointed out these facts to the people, and they perfectly agreed with me.

Amid the firing of guns and the hurrahs of Gaumond and his men, to which we responded, the steamer Napoleon III., at seven o'clock on the morning of the 21st, steamed out of Maccattina Bay. We ran out some nine miles to keep the numerous rocks at a respectable distance, and on the 22d, at six P. M., reached Natashquan. What a change! Here is a village of some forty houses, gaily painted, and a small church. You see cows, horses, and sheep, and plenty of woods near at hand. Some vegetables are cultivated. The potatoes, I regretted to learn, had frozen in the ground on the 25th of August. The number of inhabitants are about 300 souls. Several fine schooners are owned by some enterprising captains, who take off each twenty or twenty-five men and follow the coast (passing by the poor starving fishermen between Blanc Sablon and Maccattina) until they find fish. When work begins, sometimes the fish start off suddenly, and the schooners move again after them, often running two or three hundred miles before getting another chance. It can easily be understood what advantages these people possess over the others, not only to catch fish, but, as it is all taken to Quebec for sale, they get the highest market price for what they have to sell, and pay the lowest price for their supplies. I visited several of the people, and found them very comfortable. They are mostly Acadian-French, with a few Canadians. The Hudson Bay Company have a trading post here; there are also other traders. Owing to the failure of the potato crop, I left a few barrels of meal to be distributed by the missionary, the Rev. Mr. Auger. Fishing had been pretty good for those who remained near home, but those who had followed the coast and fished on shares had done very well indeed. At four P. M. we left Natashquan for Esquimaux Point, where we arrived at nine A. M. on the 23d. This is a beautiful spot, and has a fine bay, in front of which is a long, thickly wooded island, completely sheltering the harbor. We landed, and were received by the Rev. Mr. Perusse, the Catholic missionary, with whom I was already acquainted. Here everything was flourishing, even more so that at Natashquan; the potato crop was good. This village is also much larger, containing some 500 souls, Acadian and Canadian-French, and Jerseymen. Very little aid was required. There are several schooners owned here, and the people also fish on shares, besides being employed in winter in trapping. In one house I visited, as early as the season was, two men had already caught one black, one silver, and three red foxes, with three or four minks. The rivers abound with salmon and sea trout, and there is capital shooting. I have seldom seen a place where a sportsman could spend a more delightful summer. We stopped but a few hours at Point aux Esquimaux, and at last steered for home, arriving at Quebec on Sunday, 25th October, being over one month absent. Three hundred and forty-six souls received assistance, over 300 barrels of flour, meal, and peas, as well as some clothing, powder, and shot, having been distributed among the inhabitants of over thirty fishing points, who were left well provided for the winter. I am happy to add that poor Jones' and the other fishermen's hopes have been partly realized, for the next season's fishing proved more prosperous in the localities where I found so much distress, and no complaints from there have reached Government since.

The Government of the Dominion of Canada has added thirty new light houses, steam fog whistles, cannons, light ships, and provision depots to those I have mentioned, making in all, under the Department of Marine and Fisheries in this district, which begins at Montreal and ends at Belle Isle, including Magdelan Islands, Birds Rock, Bay of Chaleur, and north shore of Newfoundland, now in operation 123 light houses, seven provision depots, nine light ships, six cannons, fifty-four buoys, and sixty-three beacons, and several others are in course of construction, which, with the vessels and harbor police, are under my supervision as representing Department at Quebec.

— The large sums of money which were paid by the authorities of Blair and other counties in the mountainous parts of Pennsylvania as bounties for scalps of wild animals during the last year prompted an investigation, which revealed a well-devised and carefully executed scheme of defrauding the county treasuries. In one instance in Blair county the skin of a colt which had died was deftly cut up and made into ears, and palmed off as those of a fox.

— In some parts of Australia the wild horses have increased to such an extent, and do so much damage, that the settlers have to shoot them as they do wild beasts.

— The Glasgow *Times* says spring is opening in Mississippi, and the trees and carpet-baggers are leaving.

Natural History.

[This Department is now under the charge of a competent Naturalist, incarcerated by the Smithsonian Institution, and will henceforth be made a special feature of this paper. All communications, notes, queries, remarks, and seasonal observations will receive careful attention.]

SCHOOLBOYS AS NATURALISTS.

NOTHING has pleased us more, among all the many responses which we have received to our "Invitation," than the following scraps of information from the pupils of Mr Thomas Williamson, at Leesburg, Va., which that gentleman has forwarded. The diary for a week is as follows:—

March 27th.—Pigeons, robins, larks, blackbirds, cow-birds, red-winged blackbirds, English sparrows, blue-birds, hawks, buzzards, crows, peewees, snow-birds, and a few doves.

March 28th.—In addition to the above there were seen many doves, sparrows, tomtits, crows, sap-suckers, red-birds, golden-winged woodpeckers, killdeers, and mouse hawks(?)

March 31st.—Jack snipe, skylarks (?), wild geese were first seen, and a bald-headed eagle on Goose Creek, near the Potomac.

April 1st.—Snipe, three kinds of blackbirds, and an unusual hawk (white breast, dove colored back, black-tipped wings) were first seen.

April 2d.—Pheasants (*Bonasa umbellus*) and wrens are added to the list.

April 3d.—Blue jays, mocking-birds, and cedar-birds.

April 8th.—The preceding have become abundant, and two wild ducks and two rusty-headed fishers(?) were seen. The snow-birds still remain.

We have changed the wording of this report to save reduplication and space. It came to us with the full list of all the different birds seen each day, which, although the only way in which to keep one's own note-book, is unnecessary for publication. It is sufficient to send the additions to the list which each day supplies, and such notes as are peculiar to that day. The journals of Dr. Abbott, Prof. Goode, and Mr. Bicknell, which we have already printed, are good models to follow. Then there are other things besides birds to watch. The quadrupeds, reptiles, fishes, and insects are just as deserving of notice, and at present really need more to be studied. In a school-full of boys there might be some system about the observations. Let them divide into committees upon various branches of botany and zoology, then meet once a week and report upon each of them. Teachers should encourage this observation of nature. They will find keener minds and more tenacious memories in their pupils; and the boys and girls will learn well the lesson of examining and comparing facts, which is the basis of all good judgment. One way to encourage this is to help them to properly identify what they see so that they will know it precisely from anything like it. It is not sufficient to say "sparrows." It should be known *what* kind of sparrows, of which there are many varieties. The "tom-tits" mentioned may be one of three kinds at Leesburg, and the reader must throw away that note because it is not definite. By "mouse-hawk" we suppose the marsh harrier (*Circus hudsonius*) is meant, but it is doubtful. What "skylarks" are we can only guess, and "rusty-headed fishers" is beyond even our conjecture. This accuracy can only be obtained by studying standard works of natural history which every school library should possess. If there are no such books at hand—and we remember the lack in our own younger days—let them club together and by some means raise money for the beginning of a library. We could invest $50, or even much less than that in books, we think, here for a school, which would furnish the pupils with all they would need in that way for a long time, or until they could buy for themselves works of more minute and particular description. Whether this hint will be acted upon by any schools or academies, it is only for them to say; but that it would infuse new zest and delight into the life of every member cannot be gainsaid. Let us have more from the young folks of the country.

BIRDS OF LOWER MICHIGAN.

BY A. B. COVERT, OF ANN ARBOR,

(*Continued from Page* 133.)

FAMILY TANAGRIDÆ.

Pyranga rubra. Scarlet tanager. This beautiful bird is a very common summer visitor, arriving at Ann Arbor from May 1st to 10th, and breeding about the 1st of June. In July and August the male assumes the greenish plumage of the female, and by the middle of September all have returned to their southern homes.

FAMILY HIRUNDINIDÆ.

Hirundo horreorum. Barn swallow. Very common; arriving from the 15th of April to the 10th of May, and breeding about June 1st. It has gone south by September 15th.

Tachycineta bicolor. White-bellied swallow. Common; arrives by the 5th of April; breeds about the 25th of May; returns south by the middle of September.

Petrochelidon lunifrons. Cliff or eave swallow. Very common, in company with the barn swallow.

Cotyle riparia. Bank swallow or sand martin. Very common; arriving about the middle of April. It breeds by the 1st of June and departs for the south by the 10th of September.

Progne purpurea. Purple martin. Common; arriving from the south by the 10th of April, and breeding about the 1st of June. It departs for its southern home by the 1st of October.

FAMILY AMPELIDÆ.

Ampelis garrulus. Bohemian waxwing. Accidental winter visitor from the north. Three specimens were taken on December 12th, 1869.

Ampelis cedrorum. Cedar-bird or cherry-bird. Irregularly migratory; sometimes a resident. Breeds about the 10th of June,

FAMILY VIREONIDÆ.

Vireo olivaceus. Red-eyed vireo. A common visitor; arriving by the 15th of May. It breeds about the 10th of June, and departs for the south by 10th of September.

Vireo gilvus. Warbling vireo. The most common of all our vireos, arriving by the 1st of May. It is seldom found in the forests, but prefers the vicinity of farm houses and villages, where, about the 1st of June, it builds its nest. By the 1st of September this bird has departed for the south.

Vireo flavifrons. Yellow-throated vireo. Not common. It arrives by the 15th of May, breeds about the 10th of June, and leaves us for the south by the middle of September.

Vireo solitarius. Blue-headed or solitary vireo. Very rare. One nest, with the female bird, was taken July 4th, 1873.

Vireo noveboracensis. White-eyed vireo. Common, arriving during the first half of May, and breeding by the 1st of June. About October 1st it moves southward.

FAMILY LANIDÆ.

Collyrio borealis. Great northern shrike. Rare, but resident. It breeds from the 1st of May to the 1st of June.

Collyrio ludovicianus. Loggerhead shrike. Accidental from the south. One specimen was taken November 23d, 1871. The variety *excubitoroides*, the white-rumped shrike, is a not common resident, which first breeds about June 1st, and rears two broods in the season.

[*To be continued.*]

MARCH FIELD NOTES—BIRDS.

BY CHARLES C. ABBOTT, M. D.

IN sending you a list of the birds noticed during the past month, and not previously seen, this year, I desire it to be distinctly understood, that I do not claim it to be a complete enumeration of the species that reached this neighborhood during the month, or were first discovered in concealed nooks, where throughout the winter they had been keeping. In a locality like Central New Jersey, which seems to be a neutral ground between the ranges of northern and southern species, it is scarcely practicable to determine precisely the avi-fauna. Every year adds additional instances of the occurrence of some rare straggler; and in accordance with the character of the winter especially, is there an abundance or otherwise of certain species, that make a brief stay during that season. Again, it is scarcely practicable for an observer, however enthusiastic, to be out of doors the entire day, and I may add, evening; and yet, unless thus constantly on the watch, the coming and going of certain species will escape his notice. A list of birds characteristic of a given locality, should always be valued as a catalogue of a very limited area; and not considered with reference to any considerable number of square miles; for the variation in the surface geology, or physical geography of the neighborhood affects in a marked degree, the habits of some species and decides the presence or absence of others during a part or the whole of the year. As an instance, Gentry, in his "Life Histories of Birds," refers to our common meadow lark as migratory about Germantown, (Philadelphia) Pa., while in this neighborhood it is a winter resident; and the same might be mentioned with reference to several other species. Yet the field of Mr. Gentry's observations and of my own are but twenty-eight miles distant, as the crow flies; but geologically they are as different as well can be.

The few additional species noted in March are;—

Robin (*Turdus migratorius*). Usually abundant in February.

Kinglets (*Regulus calendula* and *satrapa*). Probably overlooked in February, as they are common throughout the winter, in varying numbers. I have elsewhere mentioned my belief that these birds occasionally remain in Eastern Pennsylvania during the summer.

White-er wren (*Anorthura hoglodytes*). These birds were common in November, but disappeared again. Twice in March I saw a pair along the creek bank.

Titlark (*Anthus ludovicianus*). A single flock seen on the 12th, and again the next day. These birds vary a great deal as to their abundance, some winters frequenting fields by hundreds, and remaining many weeks together.

Butcher-bird (*Collurio borealis*). But one specimen seen since November; occasionally they are very abundant.

White-throated sparrow (*Zonotrichia albicollis*). A number of these birds have frequented my yard for nearly a month, having been first seen on March 9th.

Blue jay (*Cyanura cristatus*). Jays are resident and more abundant in winter than summer apparently, as they are then tamer and leave the high woods. They have been very abundant throughout March, but were not noticed in January or February.

Pewee (*Sayornis fuscus*). First seen on March 6th. Since then they have been very abundant, and on the 27th a pair began building a nest.

Flicker (*Colaptes auratus*). A single specimen seen on the 12th along the hillside, which, I doubt not, has been wintering in the barn, as single birds have been found in hay-mows and other outbuildings in the depth of winter; what they find to eat is a mystery. The specimen seen was in full vigor, and seemed thoroughly to enjoy being out of doors.

Owls, *a.* long-eared (*Otus vulgaris*); *b.* short-eared (*Brachyotus palustris*); *c.* screech owl (*Scops asio*); *d.* barred owl *Syrnium nebulosum*). These four species were seen in March, the two former being quite common on the marsh meadows along the Delaware River. The little screech owl is not as abundant in winter as in summer, or at least does not appear so. Do they migrate?

Dove (*Zenaidura carolinensis*). Noted a single pair the 18th, a cold, windy day, and have twice since seen the same or other pairs.

Killdeer plover (*Ægialitis vociferus*). Flocks of killdeers were on the meadows on the 11th, 18th, and 22d.

Woodcock (*Philohela minor*). Flushed four on the edge of a dense swamp on the 18th.

Snipe (*Gallinago Wilsoni*). Snipe appeared late in March, but did not stay. I suppose they returned south.

Night heron (*Nycticardax grisea*). Several seen. They are resident in scanty numbers in the southern half of the State.

Prospect Hill, Trenton, N. J. CHAS. C. ABBOTT, M. D.

—Mr. Chas. G. Kendall, of Palmetto Island, near Port Royal, S. C., has received from Lieut. Evans, of the U. S. steamer Congress, a present of three African partridges, which have been well provided for, and are in good condition, having survived the hardships of a long sea voyage. They seem to be a hardy variety, and we trust that Mr. Kendall may succeed in propagating from them.

BIRDS AND LATE SNOW-STORMS.

FLATHEAD AGENCY, Montana, March 27th, 1876.

EDITOR FOREST AND STREAM:—

In reference to the influence of climate upon animals, let me relate a singular occurrence which happened in this Territory nearly six years ago. I was then living on the Yellowstone River, and after nearly two months of ordinary spring weather, on the 31st of May and 1st of June, 1870, we were visited by a fearful snow-storm, the snow falling in the Yellowstone Valley to the extraordinary depth of eighteen to twenty inches. The result was that nearly all the spring and early summer birds perished, and could have been picked up by scores. I strongly suspect that many a spring bird is caught forcing the season in mountainous countries, where extreme changes are so rapid, and suffers for his haste. CILIBILI.

NOTES FROM THE NORTH RIVER.

ESOPUS-ON-HUDSON, April 6th, 1876.

EDITOR FOREST AND STREAM:—

Like many of your correspondents I had remarked the scarcity of birds the past winter, at least about the farm and farm buildings, but had concluded that very likely there were as many birds in any given region as during other winters, only they were more independent and more scattered, on account of the open weather, being able to pick up their subsistence almost anywhere in the fields, swamps, and woods. I noticed that the few streaks of severe cold we had, accompanied with snow, brought the birds out. They were up and doing at once, and came familiarly about the old places.

I saw the pine grosbeak in November, and have heard it at different times during the winter. Snow buntings also have regularly appeared when the weather warranted them. Jays, woodpeckers, and tinmice I have noticed as usual, though not out of the woods. The red-poll appeared once or twice, and flocks of the goldfinch and cedar bird several times. Birds come about the house and barn and garden in winter, only when the supply of food is more abundant there than elsewhere. The eagles remained along the river as long as there were cakes of floating ice for them to alight on. I saw the first ducks of the season March 7th, a level line of them skimming the water northward. The chipmunks and muskrats were out March 6th, the day I saw the first robins. I notice that the English sparrows are prospecting through the country, holding brief consultations in bands of twos and threes about solitary farm-houses. After the villages are all occupied I expect every cluster of farm building throughout the country will be taken possession of by these pests. I shall never forget how Carlyle laughed when told that we had introduced the sparrow into this country. JOHN BURROUGHS.

WINTER NOTES FROM LAKE PEPIN.

LAKE CITY, Minn., April 7th, 1876.

EDITOR FOREST AND STREAM:—

The ducks in very limited numbers began their flight March 28th. To-day they are reported more plenty, and the little open spaces in the sloughs afford the gunner a fine chance for a good bag. A few robins and meadow larks made their appearance April 1st. This is early for these birds in this locality. In many respects our winter has been remarkable, certainly one of the mildest ever known; and strange to say, affording the fewest birds of any winter here for nineteen years. The following birds, however, came in very limited numbers: The cedar-bird, the pine grosbeak, and the well-known, storm-loving little snow bunting. The cedar-bird was unknown to me here until three years ago. For the last three winters they have come regularly, but all in one flock, and every year with increased numbers. Every mountain ash tree is sure to receive visits from these birds as long as the little red berries last. The pine grosbeak was never known in this locality until the past winter. A single flock of twenty or thirty flitted from garden to garden for four or five days, and then left us. Every other winter I have observed several species of woodpecker, but not a single one the past winter. The members of our Sportsmen's Club are all endeavoring to observe the first appearance of our migratory birds, with the design of reporting to me. In addition I have published in the local papers a request that the people at large also make these observations and report to me by letter or otherwise, so that I am in hopes of being able to make a full and accurate report to FOREST AND STREAM when our welcome visitors have all arrived. Our lakes and some of the rivers are yet fast bound in icy chains, and of course there is no fishing news, except that the pike-perch are being caught through the ice in large quantities. They ought not to be taken now, for they are on their spawning beds. Our trouting season opens May 1st. D. C. ESTES, M. D.

DO INLAND FISH MIGRATE?

NEW HAVEN, Conn., April 9th, 1876.

EDITOR FOREST AND STREAM:—

In connection with J. H. Kippart's question "Do Inland Fish Migrate?" in FOREST AND STREAM of April 6th, perhaps the following may be of some interest. In the northeastern part of this city is a lake of considerable size, owned by the Whitney Arms Company. At the outlet of this lake the water pours in an unbroken sheet over a dam about thirty feet in height, and at the foot of this dam is a long, shallow pool. This pool contains the only fresh water to be found below the dam, as salt water comes within a short distance of it every flood tide. In the lake I have found eleven species of fish, but in the pool below it I have found only four species, namely:—the black bass (*Micropterus nigricans*), the yellow perch (*Perca flavescens*), the pickerel (*Esox reticulatus*), and a species of dace, the name of which I do not know. The horned suckers (*Moxostoma oblongum*) are continually sporting and basking in the sun in the shallow water at the very edge of the dam, but I know of no instance of this species being found below it. That the trout (*Salmo fontinalis*) is more or less migratory there is no doubt, but its absence in this pool may perhaps be accounted for by the fact that very few are found in the lake and streams emptying into it, and that it is not particularly averse to salt or brackish water. SPECULATOR.

RECENT ARRIVALS AT THE CENTRAL PARK MENAGERIE.—One gray wolf, *Canis occidentalis*. Presented by Mr. J. W. H. Cummings, Newark. One sparrow hawk, *Falco sparverius*. Presented by Mr. F. S. Webster, Troy. One monkey, *Cebus fatuellus*. Presented by Mrs. Charles, Jersey City. Two small alligators. Presented by Mr. Frank Norton, New York City. One blue and yellow macaw, *Ara ararauna*. Presented by Master Woodie Darr, New York City. One Toulouse goose. Presented by Mr. J. Neale Plumb, New York City.
W. A. CONKLIN, Director.

RECENT ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDEN.—Three red-tailed hawks, (*Buteo borealis*); four flying squirrels (*Pteromys volucella*); one English woodcock, (*Scolopax rusticola*); one great-horned owl, (*Bubo virginianus*); one woodchuck, (*Arctomys monax*); one red fox, (*Vulpes fulvus*); five opossums, (*Didelphis virginianus*); four adult and three young Angora goats; one fisher (*Mustela pennantii*); one black iguana (*Melopoceras tortatus*); two Irish hares (*Lepus timidus*); two black-tailed deer (*Cervus macrotus*); four French rabbits (*Lepus cuniculus*); three prairie wolves (*Canis latrans*), born in the garden; one dava porcupine (*Hystrix javanica*), born in the garden; one pintail duck (*Dafila acuta*). HUGH.

ARRIVALS AT THE CENTENNIAL AQUARIUM FOR THE WEEK ENDING APRIL 15TH.—One spotted tortoise, *Emys guttata*, hanitat New York. Presented by W. M. Locke, Honeoye Falls, N. Y. One model of hatching trough. Presented by B. B. Porter, Oakland, N. J. Two aquaria, one of which belonged to Prof. Agassiz at his school of natural history at Pennikese. Presented by the Pacific Guano Company of Boston, Mass. FRED MATHER, Superintendent.

Fish Culture.

THE NATURAL AND ECONOMIC HISTORY OF THE SALMONIDÆ—GEOGRAPHICAL DISTRIBUTION AND ARTIFICIAL CULTURE.

NO. EIGHT.

BY PHILO ICHTHYOS.

THE discovery of the artificial method of multiplying food fishes, may be justly accepted as the greatest benison ever bestowed upon the human family, for it most opportunely augments the world's food resources, for its increasing millions. Although a decade of years has hardly passed since its adoption in our country, yet its conquests surprise and astonish even the most sanguine friends of the art, on account of the attainment of such grand results. The art is as old as civilization itself, and was lost during the dark ages, and only revived to bless the struggling people of modern times, upon whom the burdens of toil bear so heavily. Pisciculture in its modern application may be summed up as a method of fecundating and hatching the eggs of fishes, and of nursing and caring for the young fish under protection, until they are capable of shifting for themselves. For the present, efforts to multiply fishes by the artificial plan, are chiefly confined to the *Salmonidæ*, for the reason that their spawning season occurs at a favorable portion of the year. When the desire of engendering seizes upon them, they at once, if still in their native haunts, or confined to artificial ponds and races, begin to ascend to their spawning beds, and their arrival at the shingly bottoms of the stream, where they too were born, is seized upon as the fitting time of the pisciculturists for the selection of *spawners* and *milters*, from which may be obtained the annual stock of ova for artificial fecundation and incubation. When this movement begins, whether among migratory salmon, or brook trout, the females and males are technically considered ripe, and thus move in consonance with the promptings of nature to their ancestral spawning beds for the reproduction of their species. Anadromous, or migratory salmon, only ascend fresh water streams or rivers in obedience to this demand of nature, and when the deposition of their ova has taken place, they return again to the sea which contains their food, upon which they suddenly fatten. While in fresh water they cease to feed, hence grow thin, and in connection with reproduction, their flesh is insipid and tasteless, totally unfit for human food. These fishes at this time are strikingly changed in external appearance. The females instead of exhibiting the beautifully mingled and bright colors in which they formerly appeared, have become sombre in hue, putting on a grave sober attire in keeping with their condition, their beauty almost entirely disappearing until the grand object of their lives has been consummated. The males are quite the opposite in their external features. At this time they appear far more brilliant than at any other period of their lives, but exceedingly poor and thin in flesh. These facts should deter all intelligent persons from killing these fishes during the season of reproduction, for they are as unfit for food as all other animals are under like circumstances. All of those rich juices which give salmon their peculiarly rich flavor are lost, by absorption during the prolonged period of gestation, and hence their flesh is without flavor. In the capture of these fish preparatory to manipulation, great care should be exercised in handling them. They should be cautiously taken by seines or scoop-nets when fully ripe, as they are wanted. Dr. Slack in his work on "Trout Culture," says of the management of trout, that "they should be touched by the hand as little as possible." He further says in describing the care with which they should be held while the spawn is being extracted, "there are but two portions of the body of the trout where pressure even of a moderate character can be applied without injury. The first is directly behind the gills, on the strong bony arches which are there found; the other, the tail, behind the vent. In front of the former, pressure is made upon the gills, the organs of respiration, the most delicate portion of the fishes structure, while compression anterior to the vent, may cause the rupture of the air-bladder or other viscera, which would of course result in death." It is well known that the branchiæ or gills are the lungs of the fish, and from their delicate construction are easily fatally injured, and a rupture of the air-bladder from rough handling is also fatal. It should be borne in mind that a fish even should be mercifully treated, especially so, for while they are out of their native element, slight injuries may deprive the owner of a good *spawner* or *milter*. If the collection of salmon is being made for the supply of a State, or U. S. hatchery, the salmon as they ascend should be carefully seined and orraled, the parent salmon separated so that no time shall go to waste in procuring male or female, the moment they are wanted. The work of securing, catching, and manipulating large parent salmon, and the art of properly impregnating the eggs, require an operator possessed of a good deal of intelligence, as well as a great deal of practical ingenuity. These qualifications cannot be expected from novices. Time, practice, and experience, are indispensably necessary to fit men for the superintendency of such delicate operations as are necessary in fish culture that losses may not occur.

The most perfect establishment, in all of its appointments, is the great *Huningue establissment de pisciculture* of France, planned by M. Coumes, an engineer of the department of the Rhine, and Prof. Coste. The machinery necessary to work this vast hatching house is probably the most perfect in use. The course of business at this National Fish Breeding House is as follows:—The eggs are brought chiefly from Switzerland and Germany, and embrace those of the salmon family of the Rhine and Danube, and the tender *ombre* chevalier. People in distant portions of these countries are appointed to capture gravid fish of those varieties named, and having obtained numbers of parent fish, communicate with the authorities of Huningue, who at once send an expert to deprive the fishes of their spawn and bring it to the great hatchery, when it is placed in breeding or stone boxes, where it is carefully watched daily until it is ready to be sent to some district of country in want of it. The mode of artificially spawning at this French establishment is as follows:—The spawner having been caught, and the spawn ascertained to be fully ripe, the fish is held in a large tub, well buried in the water it contains, while the hand is gently passed along the abdomen the eggs are easily extracted, flowing out without interruption until they are all deposited. The eggs are then carefully rinsed and the water poured off. The milt of the male is then in like manner extracted upon the eggs by the hand being passed along the abdomen, the contact of the spermatozo of the milt immediately and perceptably changing the eggs so that fecundation is determined. After being again washed, the eggs are carefully ladled out into the breeding-boxes, where they come to maturity in due season, if properly watched and cared for. It is a noticable fact that two persons are usually detailed to spawn the fishes, one holding the head of the fish in his left hand, while the right is used to press out the eggs, an assistant holding the tail securely with a piece of coarse erash cloth intervening between the hand and tail of the fish. The success of this great national breeding-house has become so manifest that it is referred to as the model hatchery by nearly all eminent fish culturists. In the artificial spawning of trout the fish culturist is guided by the same inclination of his parent fish to ascend the races to a point where gravel is found, and determines in like manner that the period of engendering has arrived. The race where the spawners and milters have been suffered to run should have a fall of ten inches in every twenty-five feet, and by shutting off the water above, and placing a small bag-net at the lower end the fishes may be easily captured before needed for manipulation. Or a hole at the lower end of the race may be dug two feet or more in diameter and fifteen inches deep, where the fishes will flee when the supply is cut off above rather than be left upon dry land. Both of these methods are economical, as only fish needed for immediate use may be disturbed. From the hole in the lower end of the race they may be removed by a scoop-net to shallow tubs, inexpensive in character, two of which will be required to hold males and females, the separation of which, when in the scoop-net, greatly facilitates the handling of the fishes. It is usually fearfully cold where trout are spawning, and the manipulator should have his arrangement so perfect that spawning can be so rapidly accomplished that the exposure may be as brief as possible, and the spawn taken rapidly to avoid loss by the natural deposition in the race. All is now ready for operation. The pan may be made of polished tin ten inches in diameter and three inches deep, and if it is desired to count accurately the number of eggs spawned or impregnated a depression may be sunk in the bottom of the pan eight inches long and five wide and one-sixth of an inch deep, this will hold one thousand average spawn. It must be stated that any vessel, whatever may be its make or material, it must absolutely clean; no grease can be tolerated without a fearful forfeit of labor and stock, for a particle of grease will prevent the fecundation of a large number of eggs. The pan is now filled one-third full of pure water, and a female is taken and held in position over the pan thus: The operator grasps the head of the fish with his right hand, palm downward, the pressure of thumb and finger falling just behind the gills. The fish being in a perpendicular position, the eggs for the moment gravitate toward the vent; the operator then takes hold of the fish with the left hand, palm upward, about two inches below the vent, the thumb and forefinger pressing upon those parts (the fish changed to a horizontal status), where, as previously mentioned, pressure can be made without injury. What we have said applies to a right handed person; but with a left handed operator the hands are simply reversed. While the fish is held by both hands it is turned somewhat in the form of the letter S, the right and left hands being respectively placed on the head and tail. If, upon holding the fish in the position described, no eggs appear, the belly may be gently stroked from above downward with the forefinger of the right hand, and if no eggs flow out the fish should be returned to the water, as her eggs are unripe, or she is diseased. If the eggs flow out freely from the curve already spoken of, it may be increased until they have ceased flowing; then, by an adroit motion of the forefinger, soon acquired, the few remaining ones in the abdominal cavity may be forced out. According to the French method, the spawn should now be thoroughly rinsed and milted by the male, the same manipulation being had as with the female. When the eggs are thoroughly vitalized they at once assume, upon rinsing them, after the application of milt, a round, full, plump appearance, with a violet tint—evidences of complete impregnation.

The experiments of M. Vraski, the celebrated Russian pisciculturist, are interesting, and may be presented in this connection. Taking into consideration the fact that both eggs and milt are slowly obtained, their entire mass not coming at once, he reached the conclusion that when in water the greater part of the eggs fill themselves with water, and the spermatozoids ceased to move before it was possible for the pisciculturist to mingle the eggs with the diluted milt. He therefore adopted the system of dry dishes, and turned the milt upon the eggs as soon as he had diluted it. His success was complete; the eggs were fecundated without a single exception. His system is now extensively practiced, and is known among fish culturists as the "dry method."

Mr. H. S. Dousman, of Waterville, Wis., extensively engaged in trout culture, applied the dry method in the fall of 1872 in his establishment, in the fecundation of eggs, with a slight modification. Instead of obtaining contact of eggs and milt by stirring them together, he trusted entirely to the persistent impulses of the spermatozo to move directly forward, and covering the bottom of the pan with ripe trout eggs applied the milt in several spots, when, after a few minutes, it could be detected by its milky appearance to have diffused itself among all the eggs. In the use of this method Mr. Dousman has become a very successful fish farmer.

Mr. Livingston Stone, in his operations in California as United States Deputy Fish Commissioner in 1872, while procuring spawn of the *Salmo quinnat*, continued putting eggs into the impregnating pans until they were half filled

before applying the milt, and then stirred them with his hand until thoroughly mixed before he poured in the water. His success by this method resulted in impregnating nearly one hundred per cent. of the eggs.

Mr. Wilmot, in his report on the management of the Dominion hatching establishments, asserts that experience taught him each year to use less and less water, and finally his best results were obtained by the dry method, without water, and hence he has adopted the system of dry impregnation. It is also said that Seth Green early applied these principles in fecundating eggs, and it is regarded as the secret of his success.

VIRGINIA'S LIBERAL APPROPRIATION FOR FISH CULTURE.—The Committee of Appropriation in the House of Representatives has passed favorably on an appropriation of $20,000 to construct a fish-way around the Great Falls of the Potomac. The Richmond *Whig* says:—"This is considered tantamount to its passage. A fish-way at that point will render the Potomac, with its tributaries, one of the finest streams on the continent for shad, salmon, rock and herring. The Appropriatiou Committee will also probably favor an appropriation for fish-hatching by the United States Commissioner, to take effect immediately. This is a very important measure, and cannot be passed too soon, as the spawning season is already beginuing. By the speedy passage of the bill the Commissioner can have upwards a huudred millions of shad hatched to replenish all the rivers falling into the Atlantic, and at the same time stock the Western waters. If he had the money he would now be at work on the Savannah. In addition to shad, herring and rock will also largely engage the attentiou of the Commissioner. The State Commissioners, we hear, propose to do all that is possible with the limited fund at their disposal in multiplying shad and herring and rock in the rivers of the State."

—The Legislature of Kentucky having made an appropriation of $3,000 for the purpose of stocking the waters of the State, and having also passed a law for the protection of fish, the Governor, in accordance therewith has appointed a Fish Commission which held its first meeting at the Galt House, Louisville, on the 5th inst. Hon. C. J. Walton, of Hart County, being appointed chairman. Upon motion, Mr. Pack Thomas, of Louisville, was elected President, and Dr. S. W. Combs, of Bowling Green, Secretary, and the following Executive Committee was chosen by ballot: Pack Thomas, Louisville; P. H. Darby, Princeton; J. H. Bruce, Lancaster; Dr. S. W. Combs, Bowling Green, and J. A. Steele, Versailles. The greater part of the session was consumed in the discussion of matters pertaining to fish culture and the manner best to supply the Kentucky waters with fish. The chairmau stated that he had written to a number of persons concerning the intention of Kentucky in regard to pisciculture, and that he had received numerous responses congratulating him on the fact that his state had resolved to do something in so important an enterprise as fish culture.

Mr. Pack Thomas was empowered to visit the West and East, examine fish hatches, and obtain all information necessary for the establishment of the proposed enterterprise in Kentucky.

—Fifty thousand salmon trout were put in the Lower Saranac Lake last week, cutting through ice from twenty to twenty-five inches thick. This appears to be carrying coals to Newcastle. What a reflection upon our game laws that they are not enforced as they might be, with State Fish Commissioners to visit the lakes and arrest all violators during the sporting season.

—Mr. G. C. Burt, of Mankato, Minnesota, has been recently appointed one of the Fish Commissioners of that State.

THE LAWRENCE DAM.—Mr. E. A. Brackett, of the Massachusetts Fish Commission, sends the following letter, which we publish at his request:—

EDITOR FOREST AND STREAM:—

I find the following going the roonds of the papers, purporting to be from the Report of the Fish and Game Leagoe of New Humpshire:—

"Tbo Hon. Joseph Kidder theu spoke in behalf of the Committee on Fishways, which was appointed at the last meeting. He said he had understood that during the year tbs Commissioners of Massachusetts had made substantial improvemeots in the fishways over the dam at Lawrence, but upon visiting Lawrence for the purpose of inspection he had found the way over that dam even more impassable than it has ever before. The fishway was then described as it was when built, and the fact stated that at least two-thirds of the ladder had been carried away by the freshets, so that now it is totally useless."

The above paragraph, in whole or part, bas been going the rounds of the papers, doing Mr. Kidder great injustice, inasmuch as it makes him responsible for statements which are not true. Mr. Kidder is a gentleman warmly ioterested in fish culture, aod could not possibly have made such gross misrepresentations. Mr. Charles Storrow, Treasurer of Essex county, and myself examined the way Monday, April 10th, and although the water had been seven feet deep on the crest of the dam, we found that no part of the fishway had been carried away by the freshet—not even so much as a timber or plank started. E. A. BRACKETT,
Com. on Inland Fisheries, Mass.

NEBRASKA SALMON.—Wonders will probably cease when the wonder-mill stops; but as long as the U. S. Fishery Commission continues its efforts we may be prepared for such startling results as Nebraska salmon. Yet one would almost as readily expect to find birds of Paradise in Connecticut as salmon in Nebraska. The Omaha *Bee* of April 12th says that one of its editors, who has been visiting the southern part of the State, saw some fishermen seining in the Missouri river at Plattsmouth, and among the fish caught were a large number of salmon, from six to eighteen inches long. The younger salmon they threw into the river again. "These fish," it "says, no doubt came from the Elkhorn river, where, it will be remembered, Seth Green, the celebrated Massachusetts pisciculturist, had a carload of live fish dumped into the water at the time of the Union Pacific bridge accident, some two years ago. So it will be seen that the accident is proving a benefit to Nebraska, and it demonstrates the fact that salmon will flourish in our streams, muddy as some of them are."

The correspondent who has been kind enough to give us this information sends the following letter, accompanying:—

CHERRY HILL, Neb., April 13th, 1876.

EDITOR FOREST AND STREAM:—

I am informed there have been a number of fish caught at Elkborn of specie unknown before the "Elkhorn wreck." Three days after the accident I saw large numbers of young fish steadily working up stream. Among others, I am confident there were trout (this was several miles above the scene of the accident). There was also a large number of young fish caught about the wreck and taken to ponds and streams, both east and west; among them there were no doubt quite a number of "imported fish." I am going down to Elkhorn soon, and will ascertain if any fish known to be from the car have been caught. I look for reports from the upper waters of the Elkhorn with much interest. Prof. Livingston Stone's method of "planting" fish in the Elkhorn was not one that I would recommend others to try; neither do I think would he, yet it has, beyond a doubt, given us some fine fish. R. T. C.

—A very large amount of work has been done at the State Fish Hatchery at Caledonia, near Rochester. During the season of 1875-76, not yet closed, there have been distributed 1,460,000 salmon trout and eggs; 252,000 brook trout; 70,000 California salmon; 150,000 whitefish, beside large quantities of eggs of these fish. During the last six years there have been distributed from this single establishment 10,000,000 salmon trout eggs and fry, 10,000,000 of salmon, and 1,000,000 each of California and Kennebec salmon. In shad hatching 5,000,000 eggs were gathered and impregnated last year, a large part of which were put in the Hudson River.

RAISING BROOK TROUT.

CALEDONIA, N. Y., April, 1876.

EDITOR FOREST AND STREAM:—

It is but a very few years since little was known about taking, impregnating, and hatching the eggs of fish or raising the young. The brook trout were first and most largely the objects of trial, both because the price of the fish was high, and its culture seemed to afford a chance of great profit, and because on account of their habits and the length of time required for hatching the ova, they were the easiest fish with which to experimeot. Very rapid steps were made in the art of impregoation and hatching, and now these parts of the business seem to be sufficiently well understood. But from the very first days of fish culture, there has been an undue difficulty found in raising the young trout, from the time the sac was absorbed until they were five or six months old. Other kinds of fish have been hatched out and the young raised without any difficulty. Any one can rear the fry of the salmon trout or the California salmon; but not every one can raise the young of the brook trout. Just here is the queerest thing about the whole matter. Some men have no difficulty in raising their young brook trout, even if they never tried it before. Others who have the whole business at their finger ends cannot raise them at all. Their growth does not seem to be entirely a matter of skill. I am forced to the conclusion that, of waters apparently the same, some are better adapted to raising the fry than others; though wherein this adaptation consists I am still at a loss to know. The exact reason why some people lose their trout and others grow them without any difficulty has still to be determined. Of course skill has something to do with it; but no reasons known will account for the varying success of trout growers. The only guess I can make is that late fish in soft and warm waters will do better than early fish in hard and cold waters, because, in the first mentioned waters the young fish find more of their natural food. But then that is not raising them artificially. Other fish do well universally when fed in troughs, or tanks, or boxes. Young brook trout do not. In some places and with some men they do well, and in other places and with other men they die Now, the question to be determined is, what is the reason of the difference in success? How can we tell certainly whether any particular stream will not only batch out but grow trout successfully?

It would be thought at first sight that the streams which had many brook trout to them, and which have been famous for years as the abode of trout in numbers and of superior excellence, would be the streams with which the most trout could be raised; but the fact is that such is not always the case. I have known trout fry to be raised without any difficulty in what I should call a muddy mill-dam, and to die in numbers in the waters of a stream famous for its trout. I am speaking entirely of artificial rearing, because fry allowed to run free in the same stream seemed to have no difficulty in thriving well. The point is one which all pisciculturists should bear in mind, and they should give to those interested in the matter any facts coming to their knowledge which may help to solve the difficulty. A. S. COLLINS.

NEWFOUNDLAND SEAL FISHERY.—Speaking of the decadence of this commercial interest, a correspondent at Harbor Grace, N. F., attributes it in great part to the wanton waste in killing the young "whitecoats" or "cats." "In old times," he writes, "I have seen 130 sailing ships going to the ice from St. Johns. Now there are some eighteen steamers and comparatively a few sailing vessels. They say three from St. Johns and about fifteen from here. We have three steamers." Seals usually leave the ice and take to the water about April 10th, and as no favorable time for the prosecution of the fishery presented itself until the 9th of March, the season is likely to prove short, and the catch small. Our correspondent mentions several varieties of seals, as the "Harp," which carries a pattern of a harp on his back, the "Hood," which envelopes his face with a hood when in danger, the "Square Flipper," and the "Bedlamer," which is one of the fortunates who have escaped the slaughter of the previous year. He continues: "The sailing vessels take from twenty-five to sixty men, and the steamers 200 to 250 men or more. You may well imagine how uncomfortable it must be for such a large body of men cooped up as they are, in a comparatively small hold; and three or four often occupy one bunk. Its a wonder that epidemic disease does not develope itself. Our people are a hardy race, but they cannot hope to live by seals. The men's berths are ranged on a lower deck on each side of the ship; the hallast is below. When seals are taken, the centre-boards are lifted, the ballast handed out, and the seal pelts put in, when there is a heavy cargo, all the bunks are knocked down and the men must sleep where they can. Is that nice?"

Up to April 19th the following sealers had arrived at St. Johns: Leopard, with seven thousand seals; Bear, with ten thousand seals; Wolf, with five thousand seals; Hawk, with four thousand seals; Ranger, with thirteen thousand seals; Proteus, with ten thousand seals; Lion, with twenty thousand seals, and Greenland with twelve thousand seals.

Sea and River Fishing.

FISH IN SEASON IN APRIL.

Brook Trout, *Salmo Fontinalis*. Land-locked Salmon, *Salmo Gloveri*.

☞ For list of seasonable trout flies for April see our issue of March 23d.

FISH IN MARKET.—Our quotations show no material change from last weeks prices. Striped bass are worth 15 to 18 cents per pound; smelts, 15 cents; salmon, frozen, 50 cents, Kennebec, $1; California, 50 cents; shad, Southern, 30 cents, North River, 40 cents, Connecticut River, 60 ceuts; weakfish, from Carolina, 15 cents; white perch, 15 cents; Spanish mackerel, 50 cents; green turtle, 20 cents; terrapin, $12 per dozeu; halibut, 15 cents per pouud; haddock, 8 cents; king fish, 18 cents; cod fish, 10 cents; black fish, 15 cents; flounders, 10 cents; eels, 18 cents; lobsters, 10 ceuts; sheepshead, 30 cents; turbot, 25 cents; scollops, $1 per gallon; soft clams, 30 to 60 cents per 100; pickerel, 15 cents per pound; sunfish, 10 cents; yellow perch, 10 cents; brook trout, Canada, 50 cents, Long Island do $1; hard crabs, $3 per 100; pompano, 75 cents per pound.

A RARE VISITOR.—One of the smacks engaged in fishing for cod off Sandy Hook ou Tuesday morning took a fine halibut, weighing 70 pounds. It was brought to the city alive, and exhibited at Mr. Blackfords.

—Shad were caught plentifully with fly last February in Lake Monroe, Florida, a sheet of water seven miles wide, which is not a lake at all, but merely a widening of the river some 225 miles above its mouth. So far as testimony goes shad taken with the fly have always been captured hitherto at rapids and swift running water; but here there is no perceptible current, and the fact becomes interesting to those who affect this sort of sport as well as to studeuts of natural history.

—A Huntsville (Ala.) correspondeut sends us an account of a days' fishing at Gardner's Mill in the Flint River last month, when some fine strings of black bass and wall-eyed pike—known as salmon locally—were taken. Some of the latter weighed 7½ lbs. The fishing was done with live minnows, and the best success was had below the mill-dam. There is an angling club at Flint, and from all accounts the streams in the vicinity afford a good quality of sport. Short Creek, above Guntersville, is also a black bass resort; cats, drum, perch, red horse and salmon are also taken in abundance.

DESTRUCTION OF SHAD IN LAKE ONTARIO.—The *Ogdensburg Journal* referring to the shad placed by the Fish Commissioners in Lake Ontario, a few years since, as an experiment, expresses a doubt as to its success. The *Journal* says:

During the past fall and winter innumerable small fish, about four inches in length, have been thrown upon the shores of the lake and river in a dead or dying condition. They were discovered at Three Mile Bay, Jefferson county, in the town of Massena, during the recent rise of water, and along the shore of the St. Lawrence, above the Light House, in this city. If the destruction, from some unknown cause, has been as great on all the shores as at the points named, many hundred thousands of these fish have perished.

We, last year, observed and referred to this mortality, and have inclined to the belief that after a certain period shad must go to salt water, just as salmon do after they reach par-hood, or else they will die. It is true that the Ontario shad have access to salt water, which they can reach after a journey of 500 miles or more, running the rapids of the St. Lawrence, meanwhile, but it remains to be ascertained whether they *do* go to salt water, or even make the attempt. That shad travel long distances from salt water is instanced by the fact that they ascend the St. John's river in Florida as high as Lake Monroe, or about 225 miles above its mouth. There they are found in full flavor and condition. It may be that the Ontario shad do the same, but we are not aware that the fact is known.

DECREASE OF POTOMAC SHAD.—The Washington *Star* notices the small run of Potomac shad this year, and attributes it to the use of gill nets which the old fishermen say are destroying the business. It says:

The fish which would naturally ascend the river to the spawning grounds between the times of hauling the large seines are now all caught up by the gill nets, it being almost impossible for a fish to escape them. The consequence is that fishing shores which in former years rented for thousands now command only a few hundred dollars.

It is believed that there are at least two thousand gill nets between the Long Bridge and the mouth of the river, many of which stretch quite across the channel where the fish run. Many of the shad caught in these nets are destroyed by eels and catfish before they can be reached by the fishermen, and many of them drown before being reached. Those persons occupying shore landings complain that the laws of Maryland and Virginia governing fishing in this river are not enforced, and no efforts are made to enforce them.

MASSACHUSETTS—*Milton, April 15th.*—The river here is full of smelts, and but very few are taken, and those under cover of the night. E.

New Bedford, April 14th.—Fish in market are more plentiful, comprising cod, haddock, halibut, herrings, alewives, smelts, &c. The corps of amateur trout fishermen were out yesterday, "fast day," and some of them met with very fair success, especially the "knowing one's," who went fishing "over there."

PRIMITIVE "NEEDLE POINTS.—We have received from the writer of the following letter some very curious fish-hooks, and a line manufactured by the Mojave Indians of

Arizona. They are genuine "needle points," not equal perhaps to Seth Green's, but still very serviceable, as the letter asserts; and upon the fact that they are so, it may be possible to build up testimony in support of the theory of the veteran fish-culturist and fly-tosser. It is evident that Mr. Green's views must be correct, for "do not even the heathen the same?" There is nothing like going back to first principles for proof; and here we have it, from the aborigines themselves:—

COLORADO RIVER INDIAN RESERVE, A. T., March 25th, 1876.

EDITOR FOREST AND STREAM:—

Inclosed please find fish hooks used by the Mojave Indians, made from the spine of the cactus. These hooks were exclusively used before the white man introduced a better kind, yet they answered the purpose very well. I had an Indian make them in my presence, so that I could describe to you the process of bending and tempering. To the first place the spines are placed in water; then the Indian wraps his thumb and forefinger with rags; as soon as this is done he twists a muslin rag into the form of a heavy cord, and sets fire to it; he then seizes the spine between the thumb and finger endwise, the butt-end being against the thumb, and by a gentle pressure of the forefinger the spine is slightly bent, and at the same time the twisted rag, which is now a live coal, is applied to the inner side of the curve, and is moved back and forth; this heating the inner portion of the curve really tempers the hook, and causes it to retain the heat position. They will take very large fish upon this kind of hook—in fact they are expert at angling. I also inclose a piece of their fish line. It is made from the outer bark of the India hemp, and is twisted between the hand and leg, and is quickly made. YOSEMITE.

SEA FISH AND THEIR HABITS.—*Lecture before the Massachusetts Angling Association.*—One of the most practical, instructive and novel lectures that has ever been delivered on ichthyology was read by Col. Theodore Lyman before the Massachusetts Anglers Association at its meeting in Boston last week. We copy the report as printed in the Boston *Journal:*

The lecture was illustrated by specimens of food and game fish, preserved in glass jars, which have been presented to the Association by Col. Lyman and Prof. Alexander Agassiz, the former in opening his lecture taking occasion to state that the collection, which came from the Museum of Comparative Zoology, was intended as a medium to stimulate the members of the Association to present authentic types of other varieties of fish.

Col. Lyman proceeded to give directions to anglers for preserving specimens, which, after being taken, should be wrapped in a damp cloth or moss until opportunity offered for placing them in weak spirits of whisky or alcohol, when they should be allowed to soak until the spirit has thoroughly permeated the fish, which requires several days, more or less, the length of time required being governed considerably by the weather. They should then be carefully spread on a platter and covered with alcohol until the fish is hardened, when it can be placed in the jar. Col. Lyman then proceeded to describe the fishes, represented according to their classification. The first class embraced the perch, black bass, striped bass, white perch, rock bass, tautog, sea perch and scup, all of which being provided with a strong scaly armor could be transported long distances in water without injury, while fishes of the alewife class suffer on account of their light scales and thin skin. This is a difficult fish to propagate artificially, in contradistinction from the trout and salmon family.

In the first class of fishes the eggs are retained, while in the latter they fall loose into the abdominal cavity when ripe and may be easily expressed. The black bass, a noted fish, was not indigenous to the waters of Massachusetts, but through the efforts of Samuel Tisdale, of Wareham, who obtained a quantity from Saratoga Lake, the waters of Plymouth county and from them other parts of the State had been stocked with this excellent food fish, which for the angler affords capital sport. He is a hardy fellow and will hold his own against the pickerel. He has been taken weighing as high as seven pounds, frequently at four pounds, and commonly at two and a half pounds.

The lecturer remarked that the fishes of Southern and Northern waters seemed to have been prevented from visiting the territories of their neighbors by Cape Cod. Striped bass liked quiet water, and have a habit like the eel of embedding themselves in mud. The white perch run in schools, and weigh from two to three pounds. This is a very valuable article of food, and in the opinion of the lecturer, demands attention for its preservation. Formerly the black bass was not found on the north side of Cape Cod, but they were brought around from the sound in the well-room of vessels, and in the course of time have come to populate the bay. The sea perch is a favorite with the boys, and though a humble member of the finny tribe, when skinned and fried, it makes a very good breakfast. The scup is removed from the spiney species, being finer made. They were found in the waters of the bay when the Pilgrims hauded. In 1621 Massasoit offered two of these fish to the English, who recognized a resemblance to the sea bream of old England. Then these were unknown on the south side of Cape Cod. In 1800 they were very plentiful, but of late years have become scarce. The blue fish is essentially a Southern fish, which pursues the mackerel and other schooling fishes, and is very erratic in its movements. Referring to the weak fish or squeteague, Col. Lyman said it bore so much resemblance to the trout that in South Carolina it is called the sea trout. The fish is soft and will not bear long transportation.

The mackerel family was next considered, and the methods by which it was taken. The common mackerel has the instinct of game and will no longer be captured in surface seine. The celebrated blue fish was styled the pickerel of the sea, who has had more to do with changing the fauna than any other fish. It was formerly very plenty; then disappeared, and again visited our waters in large numbers, driving the mackerel and menhaden like a pack of hounds. They were mysterious fellows, and although a valuable fish were very destructive. It was an ill wind, &c., for when the blue fish were here lobsters thrived; the mackerel were driven off, and but for the canning establishments this popular article of food would grow to a marketable size. The alewife was so called by Josslyn because they were fatter than herring, the women of England who sell ale being likewise distinguished over their more temperate sisters.

Referring to menhaden, Col. Lyman said that the quantity taken annually was enormous and apparently inexhaustible. A single factory at Wood's Hole uses annually from 8,000 to 11,000 tons, and other factories consume a proportionate quantity. The shad was a magnified alewife, only it was a finer fish. Although diminished by the destructive engines at the mouth of the rivers, shad were now being brought back by wise legislation and propagation so that the price was reduced, and oftentimes the New York market was glutted. The cod and whiting were illustrated by some fine specimens. The latter resembles the cod, and is a staple article of food in England and the Mediterranean. In this country, with that wastefulness which characterizes the people, the whiting is not eaten, but is shaken out of the nets.

The last class considered was the familiar family of salmon, which was the most difficult to treat of all sea animals. It has been studied by naturalists since the time of the Romans, and they have not agreed in regard to its character. Col. Lyman contended there was no distinction between the true salmon of the sea and the salmon of fresh water. There was no proof that the latter were land locked. In conclusion, he elucidated briefly the principles which underlie and should govern the preservation of inland fisheries, which alone needed protection.

A vote of thanks was tendered Col. Lyman for his lecture, and to him and Prof. Agassiz for the valuable donation.

WHERE TO GO IN SUMMER.—*Eureka!* a correspondent has found the place! He describes it below. It seems to be just the spot which five hundred of our subscribers are looking for and asking about every season. No doubt there will be a rush of anglers there next July, on the strength of this letter, which will take the village of Dexter and the denizens of its adjacent waters by surprise. If they find everything to their satisfaction they will no doubt thank both our correspondent and our paper for the information given:—

NEW YORK, April 13th, 1876.

EDITOR FOREST AND STREAM:—

About one year ago I was asking myself the question which, I have no doubt, is now agitating the minds of some of your readers, "Where can I go for a few weeks or months during the hot weather of summer, and find a quiet, healthy place where the living will be fair and the fishing good; a place easily reached by rail, and last, but not least, where the expense will be so moderate as to come within the means of a limited purse?" One day, in conversation with a person who was familiar with the country about the eastern end of Lake Ontario, he advised me to go to Dexter, a small village near the mouth of Black River, Jefferson Co., N. Y. He told me that I could there get good accommodations for a country place—boats, board, and livery—all cheap, and better fishing than at any other place he knew of.

Acting on this information, myself and wife went to Dexter early in June last, and I must say that I found my friend had not overstated the advantages of that place. We found board for a pleasant private family, price six dollars per week. For a few dollars I got the exclusive use of a good boat for the season, and for more than three months I enjoyed better fishing than I ever did before in lake, river, or ocean. Dexter is eight miles west of Watertown, five miles northeast of Sackett's Harbor, and seventeen miles from Cape Vincent. It is about one mile from the entrance of Black River into the bay, which forms the eastern portion of Sackett's Harbor. At Dexter is found the first dam across the river, and the fish ascending from the lake, and not being able to pass the obstruction, crowd in in vast numbers, especially in the spring, and immense numbers are then taken by simply lifting them out with scoop nets. By the first of June, fishing with hook and line becomes good, and from that time onward until cold weather, a person of ordinary skill need never go out fishing without capturing a mess of fish.

I think that perhaps more kinds or varieties of fish are found at this place than at almost any other one place on our inland waters. The muskalonge seems to be considered as the game fish par excellence of the lakes, and his capture in the waters about here is the most prized, and the people living here say that more of them are taken about the mouth of Black River than at any other place along the shores of Lake Ontario. Pickerel and black bass are quite plenty; the former are frequently taken of eight and ten pounds weight, and sometimes much larger. Black bass ran from one to four pounds, and afforded me much sport by their gamy qualities. I think they will fight harder and escape oftener than any other fish that lives in fresh water. Most of the above mentioned are taken by trolling with spinning bait or spoon hook. Wall-eyed pike are plenty, and at times take the hook freely. In June and July they are in fine condition, fat and firm-fleshed, and are excellent for the table. They bite best here in the early morning or near evening. I sometimes went out about sunrise, and returned to breakfast with eight or ten fish, averaging two pounds each. Other kinds, such as rock bass, yellow perch, sunfish, mallet, eels, bullheads, and catfish, all the way up to thirty pounds, can be taken by those fond of that kind of fishing. The surrounding country is pleasant, the roads generally good, and many fine drives may be had; one road running close to the shore of the harbor and lake for a dozen miles or more, around Pillar Point, affords one of the most pleasant drives I ever enjoyed.

Parties frequently leave here for a day's excursion among the Thousand Islands, visiting Cape Vincent, Clayton, and Alexandria Bay, and returning before dark. Fare for the excursion, $1.

In short, Mr. Editor, I feel satisfied that I got more real enjoyment and quiet comfort at Dexter, than I ever did at places of greater note and more pretention. There are two hotels in the place, and it is said that they set good tables, and the charges are reasonable. A limited number of agreeable persons may find board, as I did, in private families, if they wish to stay some weeks, or for the summer; and I think that those who like home comforts and good fishing, boating, and bathing, will, on trial, do as your humble servant intends doing, go again. It can be reached by Hudson River and Central Railroads to Rome, thence by the Rome, Watertown & Ogdensburg Railroad to Limerick, on the Cape Vincent branch; thence by stage one mile and a half to Dexter. Any of your readers desiring more particulars are at liberty to call on me at No. 201 East Seventeenth street, and I will cheerfully give them any further information I am possessed of. C. SWEET.

SPINNER OR SPOON BAITS WANTED.

JACKSONVILLE, Fla., April 8th, 1876.

EDITOR FOREST AND STREAM:—

The heading of this article will probably excite the cachinatory organs of spoon and spinner manufacturers; but I can assure these gentry that I have been there, and was forced to exclaim *Mens mene tekel upharsin!* Spinners and spoon baits, as manufactured and sold by the trade, may be adapted to the capture of small fish like the black bass and pickerel of northern waters, but are not suitable for holding, playing, and landing cavalli and redfish weighing from twelve to thirty pounds. You, Mr. Editor, witnessed a portion of one of my tussels with a specimen of the latter fish weighing twenty-four and a half pounds, and you will agree with me that if I had used an ordinary trolling line, and the apology for hooks usually attached to spinners, that redfish would have been a resident of the Gulf of Mexico to day. In some of our streams trout (black bass) weighing from ten to fifteen pounds are occasionally hooked, and if ordinary spinner and spoon baits are used they usually escape.

I will admit that piscatorial experts can capture large cavalli and redfish with light tackle and weak hooks; but this does not apply to the majority of those who engage in trolling in this State. But few who visit this section are provided with a gaff hook, and in consequence strong tackle is required to hold and play the fish and lift them from water to boats. To a majority of cases broken or straightened hooks are the results of the first fish hooked, followed by exclamations or mutterings that sound badly. The old adage is that

"Fur, feathers, and hair
Make a man swear.

But my experience with ordinary fishing tackle in Florida induces me to suggest an alteration of the couplet as follows:—

Spoons, spinners, and hair
Make many a man swear,"

and in behalf of morality, and at times suffering humanity, I appeal to tackle manufacturers to supply tackle adapted to Florida fishing. The rapid dash of large cavalli, and the dogged pull and long-continued fight of redfish soon converts a hook into a barbed needle. For Florida fishing, more especially on the southwest coast, heavy wire, the strongest gimp, and hooks equal in strength and quality to those sold by Shipley & Son, of Philadelphia, under the name of cast-steel sheep-head hooks, are alone suitable for the construction of spoons and spinners for Florida fishing.

Who will supply the article and obtain a monopoly of the Florida trade? Some will ask "Will it pay?" In reply we substantially assert that we believe it will. We have a resident population in the State, and over 40,000 visitors annually, many of whom engage in fishing, and we regret to say that many make water hauls on account of defective tackle. I have advised many persons to remove the hooks from purchased spinners and supply them with serviceable ones. In conclusion, we will say to spoon makers, manufacture tackle adapted to our State, and appoint a competent agent for its sale. AL FRESCO.

[We earnestly endorse the views and statements of our experienced correspondent, and commend them to those to whom his letter is especially addressed.—ED].

WHITEFISH ON THE FLY.

KEESEVILLE, N. Y., April 7th, 1876.

EDITOR FOREST AND STREAM:—

In your issue of the 6th inst., I have read the letter headed "Do Whitefish Take the Fly?" Four years since a friend, in June, passed a fortnight at Chateaugay Lake. Comparing notes after a trip in the Adirondacks as to the number of fish taken with a fly, he outwitted me in numbers by the information that he had taken a very large number of whitefish with the scarlet ibis fly after five P. M., and undoubtedly the *coregonus albus*. During my second year's experience in the Adirondacks I have never but twice seen this species. Last spring a friend caught one at Bartlett's while fishing for maskinonge, and it was regarded as "quite a sight." During the fall—very late, however—they are taken in large numbers in a net. They are quite palatable, rather dry, and are no more to be compared to a trout than a vile sucker, or a nasty pickerel. R.

ANGLING FOR SMELTS IN CALIFORNIA.

SAN FRANCISCO, Cal., March 25th, 1876.

EDITOR FOREST AND STREAM:—

Smelts are beginning to abound in goodly quantities. They visit our bay annually in great abundance, especially about the Oakland Long Wharf, from February 1st to October, and sometimes the whole year round. They are now beginning to bite freely. They are probably of the largest species found on our coast, averaging nine inches in length. Being, as is well known, ranked as one of the salmo genus, they partake of its gameness, and one of about one to two pounds weight, which is sometimes but very rarely taken, makes a pretty lively fight. They are much relished for the table by many persons, but I think they are rather too firm and dry; but melted or drawn butter, or olive oil served up with them helps them a good deal in my opinion. I observe in your last number of the always improving FOREST AND STREAM, a short letter on smelts from a correspondent—John A. Thomas. I agree with him that the young yearlings are the best. He observes that you take great interest in smelts. I will, then, give you some account of one method of fishing for them to our bay. The pole is to be a cane, bamboo, or other good long rod from fifteen to eighteen feet in length, made either with or without joints, and a light but strong line, either fastened to the top of the pole, or connected with a good large four-fold multiplying reel, at the end of which line there is rather a heavy lead or sinker, above which are tied three or four small hooks about a foot apart, baited with pieces of worms, found among the mussels which attach themselves to the piles of the wharf or bridge. The smelts come up and return with each tide to cast their spawn or melt on those shores or flats of the bay which are either sandy or muddy. In the fall season, which has not yet arrived, these species of *salmonia* come up from the ocean through the Golden Gate in enormous quantities, and bite generally so ravenously at the bait offered them that it often happens that the angler hooks and lands three, or even four of them at one time, and when three or four of them weigh each—which they sometimes do—over half or three-quarters of a pound, the angler has his hands full to secure them all on *terra firma*. In the height of the "take," when there are a hundred rods plying at once, the scene is a very lively and interesting one, I assure you. Sometimes, but very seldom, young salmon of two or three pounds are hooked in this way, when there are any about. You angle for these gamey fish, the smelts, about three feet from the surface of the water, moving your bait to and fro to entice their natural avidity for food. A few angle with the float, in which case they hook themselves. Their form, as is well known by those who have any knowledge of fish, is long and sharp, like the model of a sailing cutter, and their scales are of a silvery brightness and brilliant whiteness. Their flesh, as I have before observed, is rather tough and dry, but they are pretty general favorites with fish-eaters. They are good with many, fried with eggs and cornmeal, or pounded crackers. They are particularly prized as a breakfast dish, and possess a flavor peculiarly their own. But they do not have the cucumber flavor which they possess in the East, or in Europe. While fishing for them, large white perch, called Sacramento River perch, from one to four pounds weight, are often taken. E. J. HOOPER.

MOVEMENTS OF THE FISHING FLEET.—It has proved a busy week around the wharves and on the railways, as the Southern mackerel fleet are getting underway for the early schools of mackerel. Some forty sail are now being put in readiness, and will sail next week. There is no difficulty whatever in getting plenty of first-class fishermen to man this fleet, and green hands do not stand much of a chance this Centennial year of the nation.

There have been 34 arrivals of the fishing fleet the past week, 32 from Georges, and 2 from the Grand Bank. The receipts have been 1,280,000 pounds cod-fish, 40,000 Georges halibut and 160,000 pounds of Bank halibut. Shore cod-fish and haddock have been in light receipt, selling for $1.50 per quintal for cod and $1.25 for haddock.—*Cape Ann Advertiser, April 15th.*

HASH IS HASH.—For genuine hash three ingredients, aside from the seasoning, are required: Nice corned beef—if home prepared, sweet, tender, and red, all the better; good potatoes, boiled "on purpose;" and—fidelity. The last is the most necessary, for it ensures that the meat shall be carefully looked over, and chopped *fine;* that the potatoes shall be treated separately with equal care; mix together thoroughly in the chopping-bowl, with the knife. Cook slowly, moisten with milk, and season with butter, pepper, and salt. Pack it snugly in a covered dish. When done, if you want an extra finish, put in the oven and crisp over the top to a delicate brown. Always serve hot.—*Golden Rule.*

Yachting and Boating.

All communications from Secretaries and friends should be mailed no later than Monday in each week.

HIGH WATER, FOR THE WEEK.

THE BROOKLYN YACHT CLUB.—A regular meeting of this club was held on Wednesday of last week. The committee appointed to settle the dispute in regard to last summer's Greenport regatta, in which it was claimed that Rear Commodore Davidson, owner of the yacht Sadie, had dropped a man after crossing the line, thereby violating rule 8, reported that as it had not been shown that Commodore Davidson had violated the rule intentionally, recommended that the owner of the Sadie be awarded the prize. After a brief discussion, the report of the committee was voted down, thus leaving the matter between the White Wing and the Kate. Capt. B. S. Osborn offered a resolution that the prize for the first-class sloops at the Greenport regatta of last summer be awarded to the Kate, owned by Capt. Randolph. Mr. Heintz moved that a committee of three be appointed to take testimony in regard to the matter and report to the club. The Chair appointed as such committee Commodore Dillon, Capt. Huntley and Mr. John Oakey.

THE AMERICA'S CUP.—The New York Yacht Club have accepted the challenge of Major Gifford, of the Royal Canadian Yacht Club to sail the Countess of Dufferin, now being built at Coburg, Ontario, for the Queen's Cup, won 25 years ago by the America.

Details are to be considered at a future meeting.

—The yachting men of Bostou are beginning to put their boats in order for the season, and it is probable there will be greater interest in the sport this year than ever before. There are now eleven yacht clubs in New Englaud, all but one of which belong in Massachusetts. They comprise a membership of about 1700, and a fleet of nearly 450 sail.

—Mr. Havemeyers' Steam Yacht Emily has been sold to Capt. John H. McGrady, of Boston, and been added to the fleet of the Lynn Yacht Club.

—The yacht "Psyche," owned by John E. Butler, 25 feet keel, was launched at Halifax, Nova Scotia, last week, and will appear at Philadelphia during the Centennial.

ICE YACHT FOR THE CENTENNIAL.—Mr. Irving Grinnell, President of the New Hamburgh Ice Yacht Club, has shipped to Philadelphia a splendid full sized Ice Yacht, to be exhited at the Centennial. Ice yatching is a sport peculiar to this country, and the specimen built by Mr. Grinnell is the most thoroughly equipped and finished of any ever built. From the truck will hang the beautiful silk ice yacht challenge pennant, thirty feet in length, which would have been sailed for this winter had not the unusual absence of ice almost entirely prevented any racing.

ROWING ON THE HUDSON.—On Saturday members of the Alert and Carmansville boat clubs rowed a friendly match on the North River, opposite Audubon Park, the distance being three miles with a turn in six oared shells. The Alerts took the lead and kept it until nearly turning the stake boat, when the Carmansville men put on a spurt and the two boats were then nearly even. The Alerts turned first, and finally won in 19m. 18s.; Carmansville, 21m. 21s. A single seull contest also took place between A. R. Johnson, of the Alert Club, and W. R. Samuels, of the Carmansville Club. The course was two miles straightaway. Samuels was passed by Johnson when the first mile was rowed, but soon after Samuels regained the lead and won easily by two lengths.

CENTENNIAL RULES FOR BOATS ON THE SCHUYLKILL.—In consequence of the large number of boats which will pass up and down the Schuylkill during the coming season, the Schuylkill Navy has issued the following rules:

1. A boat meeting another "head on," shall keep to the right, leaving the boat passed on the port or left side.

2. A boat overtaking another boat shall keep clear of the boat overtaken.

3. After sun-down all boats of the Schuylkill Navy shall carry an orange head-light, as adopted by the Naval Board.

4. After sun-down, boats coming down shall avoid the eastern or shore arch of Columbia Bridge, and keep well out in the stream, rounding the bend below and the bend at Turtle Rock.

5. Boats going up shall keep close to the eastern shore.

—The Harvard University Crew has been out several times in its six-oared barge, and the men are speedily getting in trim. The subscription list for the crew amounts to $2,205.50, of which $617.50 has been paid in.

THE NOVA SCOTIA CENTENNIAL CREW.—The five men selected to practice for the world's race at Philadelphia went into quarters last week at the Arm, and will be thoroughly trained under the direction of Jerry Holland, the trainer of the old Pryor Crew. The five are John Nickerson, Richard Flemming, Obadiah Smith, Caleb Nickerson and Warren Smith. It has not yet been decided which of these will be spare man. It is said by those who know that, man for man, these five are the equals of our Carnival crew, and if such is the case there need be no fear of the result at Philadelphia if due care is taken in the selection of a boat.—*Halifax Herald, 11th.*

Rational Pastimes.

BASE BALL.

—On April 15 the legitimate amateurs Osceolas opened play at Prospect Park in a game with the Nameless Club of the same class of amateur organizations. Owing to the splended catching of Grearson and the pitching of Valentine the score stood at 16 to 2. Ten men played, and the game consisted of ten innings.

—The professional season of 1876 was duly inaugurated on April 14th at New Haven, the first clubs to enter the arena for the United States championship being the Boston and New Haven Clubs. The game was played in the presence of over three thousand people, and it proved to be a well played and interesting contest, as the appended score shows:

BOSTON.	TB	R	In	PO	A	E
G. Wright, s. s.	4	0	2	0	5	2
Leonard, 2d b	5	0	2	1	2	1

Boston	2	0	0	1	0	1	0	0	0	—4
New Haven	0	0	0	0	0	1	0	0	0	—1

First base by errors, Boston, 5; New Haven, 3. Runs earned, Boston, 0; New Haven, 0. Balls called, on Boston, 10; on Nichols, 21. Struck called, from Borden, 35; from Nichols, 23. Foals struck, from Borden, 17; from Nichols, 16. Average of foals struck, Borden, 2; Nichols, 4. Average of bases called, on Bordeo, 1.+; on Nichols, 2.1. Average of strikes, from Borden, 4.8; from Nichols, 2.7.

Umpire—Mr. A. D. Ayers, of the New Haven Greys.

Time af game—one hour aad forty minutes.

The umpiring was excellent, and some very fine play was shown. Borden bore off the palm in pitching, and George Wright at the bat.

—The following is the record of the principal contests of April, in which the professional clubs have taken part since our last issne:—

April 8—Louisville vs. Memphis	31 to 5
April 9—Empire vs. Grand Haven, at St. Louis	12 to 9
April 12—Hartford vs. Trinity College, at Hartford	16 to 2
April 14—Boston vs. New Haven, at New Haven	4 to 1
April 15—Boston vs. New Haven, at Boston	11 to 3
April 15—Athletic vs. Centennial, at Philadelphia	8 to 4
April 15—Brooklyn vs. Trenton, at Brooklyn	32 to 5
April 17—Athletic vs. Active, at Philadelphia	9 to 2
April 17—K elnz vs. Philadelphia, at Philadelphia	4 to 2

It will be seen that only four good scores were made out of the nine games.

—A freely played game took place at Lowell April 13th, in which the Havard College men of 1876 defeated the co-operative professional Lowells by the appended score:—

LOWELL.	R	B	PO	A	E
Say, s. s.	0	0	1	1	1

Harvard	1	0	0	0	0	2	0	—3		
Lowell	0	0	0	0	0	1	0	0	0	—1

Runs earned—Harvard, 1.

Umpire—G. F. White, Lowell. Time—1 hour 50 minotes.

—The Brooklyn Chelseas opened play in good style at the Capitoline grounds on April 11th, by defeating a strong picked ten, by a score of 26 to 3. Rules' pitching and Roche's catching were the features.

—The Chicago Club grounds are still under water, says a local journal of the 15th inst., it having been found impracticable to drain them on account of the low ground, the surrounding fields being no lower. On the 20th, if the grounds are in a suitable condition, a practice game will be played by the regular nine against Bradley, Clapp and McGeary of the St. Louis Club, assisted by picked amateurs. On Saturday Spaulding, Barnes and White will go to St. Louis to play a like game with the professionals there. These games are played under the new League rule for exhibition games.

—The Beacon Club of Boston—about the only legitimate "Knickerbocker" amateur club in the Hub—has retired from the field, having no opponents of their own class to play with, semi-professionalism having gobbled up all the other so-called amateur clubs of Boston and its vicinity.

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

F. B. P., Cambridge, Mass.—Will you kindly give me the address of Mr. Palmer, whose bitch, I see hy your last issue, gave such a large litter of pups to her owner. Ans. No. 54 West 11th street, New York City.

G. W. RAGSDALE, Gainesville, Texas.—Can you inform me where I can obtain a volume of *The Ibis* for 1865, and its probable cost? Ans. Doubtful if you can get a copy short of *The Ibis* office, London, England. It will cost you about $12.

LOPEAR.—Rabbits are not indigenous to Newfoundland. Some years ago Andrew Downs, of Halifax, sent a number of Nova Scotia rabbits there, and now we are told that rabbits are as numerous in Newfoundland as in Nova Scotia.

G. W. P., Williamsport, Pa.—I have a cocker spaniel pup who the distemper has left with the chorea, or the jerks. Can you prescribe anything for the complaint? Ans. We never have been able to cure a dog afflicted with chorea.

POINTER, Newark.—Please inform me why the word "dropper" is used for a whelp from a pointer and setter? Ans. The word "dropper" is used to designate the cross between setter and pointer only, and a very good word it is; but how it originated we do not know.

A. K., Quincy.—My pup appears to have the itch, or something, at the butt of his tail. He keeps running after it, and he seems to have a fever inside. He drinks a great quantity of water. Ans. Your pup probably has a touch of mange. Try the remedy recommended to W. H. D., in this column.

W. J. C., Jamaica Plain.—What kind of a dog would be best for hanting woodcock, and what the price of the same, about five months old, and where could it be bought? Ans. We consider the setter as the best dog for woodcock. A pup about five months old is worth $25; at that price we can procure one for you.

SNIPE, Monroe. Mich.—I have a dropper bitch; takes after sire, an English setter. If breed her again to an English setter, what blood will the result be, and will they be good? Ans. By breeding your bitch to a thoroughbred setter, the pups will most probably have full, or nearly full, setter coats, and may make as good dogs as if thoroughbred setters.

MAT, Goshen, N. Y.—Can I draw a seine in the Wallkill, which runs through Ulster and Orange counties? I wish to draw it for suckers and catfish, as the above are only fit for use during the early part of the spring. Ans. There is a law with a penalty of $25 attached, which expressly forbids the taking of fish in the Wallkill in any manner save the hook and line.

W. H. D., Corning, N. Y.—I have a valuable dog that has the mange. Can you tell me what will cure it? Ans. Take compound sulphur ointment; add to it a little spirits of turpentine, so as to be able to rub it well into the skin; apply two or three times a week; wash the parts occasionally with castile soap. Give your dog a gentle purgative and plenty of exercise, always keeping him in a clean place.

ZIP, New York.—My setter Zip has two very bad teeth, which keep him continually frothing at the mouth, and they interfere with his eating very much, and I think they will be difficult to extract. What would you advise me to do; if to extract them, can you inform me of any person that will do it? Ans. The defective teeth should be extracted, and we presume that any veterinary surgeon would perform the operation.

SUBSCRIBER, Yorkville.—1. The use of kerosene oil failed to remove the rust stains from inside of my gun barrels. 2. Can you recommend a competent and reliable smith in Baltimore for re-boring? If not, in N. Y.? Ans. 1. Mix a small quantity of fine emery with the kerosene; or, better still, with benzine; but it should be used with care, as constant friction with emery and oil will change the bore of a gun. 2. You will find Messrs. Clark & Snider reliable gunsmiths, of Baltimore.

G. M. E.—Is there good shooting (enough so as to make it pleasant for a party to camp a few weeks) in the country around the head waters of the Connecticut River, in New Hampshire? What is the best and nearest route from Boston? Ans. Excellent shooting and fishing in their season. Take Atlantic & St. Lawreace Railroad form Portland to Stratford, N. H., and thence stage to Colebrook. It is 25 miles wagon road from Colebrook to the Connecticut Lakes and adjacent waters.

E. B. S., Pecoscola Fla.—Please inform me if Dr. Cones' "Field Ornithology" gives descriptions of birds with sufficient minuteness to enable me to identify species? If not, what work will do it, and what is the price of the least expensive one that is complete? Ans. Dr. Cones' "Field Ornithology" deals only with taxidermy, etc. His "Key to North American Birds," price about $7, is the least expensive and best work for identifying, unless you buy Baird, Brewer & Ridgway's recent large work.

CHIPPIES, New York.—I have a setter dog six years old who, having run loose in the country all last summer, got in the habit of ranging after chippies. The dog being a first-rate retriever and very good ranger, would be very valuable, if he could be broke of this habit, and I would therefore be very much obliged to you to give me your opinion and advice about it, how I could break him of it? Ans. Any dog may be broken from chasing small birds, if the rawhide used for punishment is three or four feet long, and properly applied.

READER, New York.—I have a bitch, and last fall was her first season on game, and she worked magnificently, but would pay more or less attention to small birds. This season I've had her out on snipe, and she pays more attention to small birds; when she comes to where they have been she will go head down and nose all over the place. Now, I wish to know if her case demands a puzzle peg? Ans. If you cannot prevent your dog from nosing around after small birds by the use of a whip, you can break up his fault by using the puzzle peg.

J. H. W., Newark.—Will you please decide the bet between George L. and Thomas S.? George L. bets Thomas $10 that A. H. Bogardus killed 100 pigeons, and that they all fell inside of 80 yards boundary. Thomas S., who is a subscriber to your valuable paper, bets that Bogardus did not do it. Ans. At Dexter Park, Chicago, July 21st, 1880, Bogardus matched himself to kill 100 birds in 100 successive shots, to load as he pleased, and accomplished the feat. In the report of the match nothing is said about boundaries, and we believe there were none.

W. H. S., Philadelphia.—Inclosed pattern made by my 12-bore, muzzle-loading shot gun at 30 yards, with 1 oz. of No. 8 shot (the gun shoots with great force). Do you think it shoots close enough, and if not, what can I have done to it to make it shoot closer? It is a fine gun, and I do not think that the barrels are thick enough to admit choke-boring? The gun is marked Manton. Is not Manton dead? Ans. If the pattern you have sent us is an average of what your gun will make, you need no closer shooting gun for general upland shooting. Such a gun, with Kay's cartridges, would do all that could be expected from a choke-bored gun. Manton has been dead many years.

W. J. P., New York.—Please inform me if the Dittmar powder is loaded la shells in the same manner as the ordinary black powder, and if the quantity used for a charge is the same as of the latter? What would be a proper dueklog charge of the Ditmar for a 9¼-lb., 10-bore gun? Do you consider it entirely safe, and is it equally adapted for use in muzzle-loading guns? Ans. The Ditmar is used in the same manner as black powder, *measure for measure*, (not weight). For a duckiog charge in your gun, say 4 drs. (bulk). We believe it as at present made to be perfectly safe, and it is equally adapted for muzzle-loading guns, only should not be rammed too hard.

R. B. B., Sparta, Ga.—1. Will you please tell me how to use benzine in removing lead from guns? 2. Does the Remington cartridge loader prevent the expansion of paper shells when loading with wads one size larger than the shell? 3. How does it compare with the Startevant loader, aad which do you consider the best loader? I want your opinion, because I place every confidence in it. Ans. 1. Use it on a piece of flannel on your cleaning rod; if not effectual add a small quantity of emery powder. 2. It does not, nor do we believe that any loader will. 3 The Remington, we believe, is the latest out, and may possess improvements not found in the others, but the Stotevant is fitted with a cylinder for the shells which may prevent expansion.

R. A., Warren, Pa.—Inclosed find a photograph of my pointer Max. He is sixteen months old, and very fast in the field. We have nothing but upland shooting here in thick cover. He scents a long way, and is very apt to flush his birds. He is out of a Jersey setter bitch and an imported English pointer dog. He was raised in Columbia, Lancaster county, Pa. Please tell me what you think of him from his photograph and much oblige. If possible, tell me how I can break him of being so fast in the field. Ans. Judging from the photograph of your pointer, we would take him to be a thoroughbred, fine-looking dog. Age and hard work will no doubt tone down his speed, aad by the time you get him well broken he will not be too fast. While breaking a dog you can reduce his speed by compelling him to drag fifteen or twenty feet of stout cord.

SUBSCRIBER, Oshkosh, Wis.—I have a fine pointer dog two years old. When in the field he comes to a splendid stand for a few moments, then rushes in and flushes the birds. It makes no difference whether I shoot or not, he chases them until he gets tired. Have whipped him for it very severely, but it seems to do no good; dislike to shoot him, as some recommend. Who is the most responsible party near to this place that I could send him to and have him broken of this habit; also to retrieve? What would be the cost? Could he be broken by August 15th? Should I coaclude to break him myself, what course should I take? Ans. A 4-foot rawhide properly applied will break any dog from flushing and chasing game. We do not know of a breaker in your section of the country. In our issne of the 6th inst. you will find directions for teaching dogs to retrieve.

COL. J. V. O., Sparta, Ga.—Can you give me instructions how to raise gold fish? I have the tank, etc. Ans. Use any well, or creek, or river water that is not impregnated with mineral; change the water when the fish come to the top and stay there and breathe part water and part air. When you change the water take out nearly all, leaving enough for the fish to swim in, and fill the vessel with fresh water. Never take the fish in your hand. If the aquarium needs cleaning make a sort of mosquito aettiag and take the fish out with it. There are many goldfish killed by handling. Keep your aquarium clean, so that the water looks as clear as crystal, and watch the fish, and in a little while you will find out whether your fish are all right. Feed them all they will eat and anything they will eat, worms, meat, fish, wafer, or fish spawn. Take great care that you take all that they do eat out of the aquarium. Any decayed meat or vegetable in water has the same smell to fish in water that it does to you in air. If your goldfish die it is attributable, as a rule, to one of the three causes—handling, starvation, or bad water. We have printed considerable on this subject from Seth Green and others, and have mailed to you the papers containing the information.

FOREST AND STREAM

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCULCATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,

[POST OFFICE BOX 2832.]

123 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty-five per cent. allowed for five copies and upwards.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent.; over six months, 30 per cent.

NEW YORK, THURSDAY, APRIL 20, 1876.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Editor.

WILLIAM C. HARRIS, Business Manager.

CALENDAR OF EVENTS FOR THE COMING WEEK.

THURSDAY, April 20th.—Rifle; annual meeting of the Aiken Schutzengesellschaft, at Charleston, S. C. Base ball; Boston vs. Lowell, at Lowell; Cambell vs. Kleintz, Philadelphia. Racing; New Orleans.

FRIDAY, April 21st.—Base ball; Centennial vs. Athletic, Philadelphia; Philadelphia vs. Quicksetep, Wilmington, Del. Racing; New Orleans.

SATURDAY, April 22d.—Rifle; Geiger bull's-eye trophy match, Creedmoor. Base ball; Boston vs. Athletic, at Philadelphia. Racing; New Orleans.

MONDAY, April 24th.—Base ball; Boston vs. Hartford, at Hartford.

TUESDAY, April 25th.—National Field Trials at Shrewsbury, England. Base ball; Louisville vs. Chicago, at Louisville, Ky.

WEDNESDAY, April 26th.—Rod and Gun Club Bench Show of dogs at Springfield, Mass. Massachusetts State Sportsmen's Association, Springfield; National Field Trials, Shrewsbury, England.

TURF, FIELD, AND FARM RACING RECORD.—Our contemporary announces that its "Racing Record for 1876" is now ready for distribution. This is a handy book of reference for turfmen and others. It contains summaries of all the racing of 1875, and the nominations in all the stakes to be run this year at Jerome Park, Long Branch, Saratoga, Baltimore, New Orleans, Nashville, Lexington, Louisville, Cincinnati, and Philadelphia. The indices to past racing and stakes to be run are full and complete, having been arranged with great care by a competent gentleman. The price of the volume is $1.50. Every turfman should have it. Address the *Turf, Field, and Farm*, 37 Park Row, New York.

BUFFALO POULTRY SHOW.—Our Buffalo correspondent writes us that a poultry show larger than any ever before held in that city will probably be held next fall. The Forrester Club propose holding a Bench Show of dogs at the same time and also a large exhibition of game birds. Our correspondent says: "I have no doubt the Forrester's will do their best to make the show as much of a success as the poultry shows heretofore have been. I am assured by Hank Curtiss, of Black Rock, that he will be on hand with as full a collection of our local fishes as it will be possible to get together. When "Hank" sets out to do a thing of that kind he succeeds. Fred Mather knows that."

LONGEVITY IN MAN, AS PROVEN BY PHYSICAL INDICATIONS.

THE problem by which the span of human life is estimated is one of much importance. It is known that every living thing, either vegetable or animal, has its lifetime, which is governed by the fixed law of inheritance. It may be illustrated by taking seeds of different kinds so closely resembling each other as not to be easily distinguished. When planted and germinated, some will live for centuries as species of the oak, while others spring up, bloom and perish in a few hours, months, or years. In carrying this theory to the animal kingdom, we find the same theory exemplified; some of them live for a century or more, while others perish in comparatively a short period. The laws which regulate life are beyond mathematical calculations, and the subtle force of existence is beyond the determination and reasoning of science.

The life germ of some animals cannot be designated microscopically, yet one inherits longevity and the other does not. The foal of the horse and ass, when crossed together, is a mule, which retains the vital force of the stronger parent, and when the existence of the weaker parent is spent, the diseases incident to this parent are passed, and the offspring lives a new life, and not subject to diseases of the horse kind, and so far as longevity is concerned, is in reality an ass, although in size it partakes of the horse. Although anomalies are produced sometimes, life must be transmitted by its own kind.

Race has considerable to do with longevity. We know that the Esquimaux and Laplanders are a short-lived people, while Indians, Italians, and the Welsh are known to have inherited longevity. Persons may die young who have descended from long-lived ancestry, though we seldom see offspring live but a few years longer than the parents from which they sprung. This idea was advanced by Dr. Lambert in a lecture on longevity, and it is a point well worth considering. When longevity is inherited from one side of the parents and the reverse is the case from the other, some of the children are apt to droop at the time of the demise of the parent whom they are most alike; but should the offspring live beyond this time, the health improves, and the prospect for longevity is greatly enhanced, and may be prolonged to the age of the most robust parent. It is a favorable indication for the offspring to resemble the longer lived parent; when this is the case the stamina of constitution is also apt to be inherited. Individuals with particularly long bodies, when otherwise well developed, have physical signs of long life. If they are comfortably situated and free from anxiety, all things being equal, they physically have better promise of long life than those situated otherwise. Married persons, if happily connected, have a better prospect for long life than the unmarried; regular habits in either sex favor longevity; excesses and vices and violations of physiological laws tend to shorten life.

Persons inheriting longevity with correct habits, exempted from the cares and anxieties of life, rarely succumb to epidemic influences. This is noticeable in epidemics of cholera and yellow fever, and should they become prostrated from either sickness their chances for recovery are better than others. Sickness pervades both classes, though those who have inherited this principle of sustaining life to an advanced period are more capable of resisting disease and of living on than those who are not possessed of such vitality. It is asserted that three-fifths of the families in every community pay the burden of doctors' bills; this accords with the writer's experience. Those possessing constitutions capable of resisting disease seldom need the services of a physician. As a rule, diseases peculiar to a family pass from generation to generation. The indications by which long life may be inferred are many—figure, proportion, weight, height, complexion, features, color of the hair, eyes, teeth, and skin, texture of bones, muscles, etc.,—all have a special bearing on the length of time an individual may live.

It is affirmed that it cost no more to raise a person who is capable of living for a century than one who does not live more than half the period; but the profits to the nation accrue after the half century has passed—that is, the first half of life is consumed in paying the expenses of rearing, and the latter half of life develop the accumulated profits. Longevity has a direct influence on the prosperity of every race of people; of this class the Jews afford a striking example. The heavy work of life is usually selected by those who require long life for its accomplishment, such as statesmen, historians, etc. The names of Humboldt, Newton, Webster, Franklin, and Shakespeare afford examples. It would not be correct to say that genius could not be developed in short-lived persons, for the sparkling poetry of Byron, and the effusions of Poe and Pollock show to the contrary. Judges of live stock can tell at a glance the capacity of a cow for giving milk, and whether it will be of superior or inferior quality. The jockey, by inspection, can correctly determine the endurance and speed of a horse, and so can the probable longevity of the human species be determined by definite characteristics. They are as plainly visible to the practiced eye in the human as in the brute creation. Buffon was of the opinion that persons who arrive at full growth slowly live to a great age. Longevity in man is necessarily dependent upon sound lungs, with large capacity for respiration. Men of intelligence who study carefully nature's laws are enabled, by close observations, and by comparing the lives of individuals within the circle of their acquaintance, to judge of the prospects of longevity of their friends very nearly.

The indications of longevity are manifested by a strong voice, good appetite and digestion, excretions free and regular, hair rather approaching fair than black, beard shading lighter down the face, skin smooth and clear, feet broad and thick, not long and slim, hands large with fingers not too long, neck medium in length, head medium sized, sound teeth of a yellow cast, pulse strong and regular, chest deep and capacious, shoulders rather inclined forward, but not flat, thickly set but medium-sized stature, with strong bones and muscles.

In reference to the relative longevity of the sexes, according to tables prepared in Holland, and extending over a period of 125 years, females live three or four years longer than males. The mother usually transmits her constitution to the offspring, rather than that of the father. It must be admitted from established facts that long life is an actual inheritance, yet harmony is established by the laws of longevity, and each race or individual fulfills its destiny, and then gives way to be replaced by another. If this was not the case the earth would become unduly peopled.

RECOLLECTIONS OF OLD SPORTSMEN.—It is well to turn back betimes to the record of the past, that we may better estimate the things of the present. Such reminiscences as these that follow, and such as are occasionally contributed to us by contemporaries of this writer, will be read with more than passing interest, not only by the new generation, but by the survivors of the old. No doubt this gossip of a veteran, but by no means a retired sportsman, will arouse many recollections that will chime in sympathy therewith like the bells of a moss grown tower, and perhaps awaken responses from the ancient hills that our readers will be glad to hear. By such jottings as these we are not only enabled to compare the wonderful progress of our country within a brief period, but to recall and note the improvements that have taken place in all the arts, sciences, and arms. Foreigners can no longer throw into our teeth the charge that we are very new; that we have no past—no storied ruins that, crumbling at the touch, tell even in their decay of days and deeds so far gone by that the very distance invests them with a mist and halo of romance. They cannot twit us with having no traditions, to keep alive the flame of glory, and the fame of statesmen and jurists of renown. They can no longer sniff their noses at our primitive houses and the smell of undried paint. Not only do the reminiscences we print herewith gainsay it, but the report of a hundred years affirms itself in its completed and majestic cycle, exhibiting a century of such checquered life, strange experiences, startling changes, and wonderful progress, and crowded with so much to engage the time of the future historian, that the mere retrospect alone seems likely to disturb the accummulated dust. Our correspondent says:—

"Fifty years ago, say about 1826, or before the building of the Milldam Road, now called the Western Avenue to Boston, the tide ebbed and flowed over what is now the Public Garden, Arlington, and Berkley streets; as Mr. Emerson said in his Centennial poem,

> "Twice each day the flowing sea
> Took Boston in its arms."

There, where Washington bestrides his stone charger, I have shot ducks, and I well remember on a November day, being out on that wild and desolate marsh, in a gunning float in pursuit of water-fowl, I was overtaken by a snow storm, and with my companion had hard work to save ourselves from perishing in what is now the most valuable part of the city, and covered with the homes of millionaires.

Fresh Pond, in Cambridge, was at that period a noted resort of wild-fowl, and I have more than once seen the day break while lying in the marshes at the outlet, in a boat with that staunch sportsman Nat. Wyeth, waiting for flocks of teal. The woods of Newton, Watertown, and Cambridge, contained at that time many partridges and woodcock, and every farm had a covey or two of quails. Can you realize the fact, Mr. Editor, that your correspondent lived before the introduction of the percussion cap, and that his first fowling piece was exploded by flint and steel. In these days where the muzzle loader is almost obsolete, it may be interesting to know, that the dispute between the advocates of the new methods, the detonator or percussion principle, and those of the old and well tried flint lock, was as long and earnest as now between the friends of the muzzle and the breech-loader. It was acknowledged that the percussion system was quicker, but the old fogies declared that the flint lock threw the shot stronger. I, being at that time young and progressive, had my gun altered from a flint lock to a detonator, or as the gun smith persisted in saying, "he percushed it." This in spite of the disapproval of my elder sporting friends, particularly an uncle who gave me my first lesson in shooting on the wing, and who being a good shot with the old weapon, disbelieved in the new.

At that period, all the clear brooks about the vicinity of Boston contained trout, and many a good basket have I made in Smelt Brook, in Newton. The last brace I killed there weighed two pounds—this was about 1828—and was done with bait, these streams not being suited to fly fishing, even if we had known how, which few did at that time. There might have been half a dozen fly fishermen among the 40,000 inhabitants of Boston, and strange to say two or three of those were in the habit of going to Scotland for their sport, believing that the salmon of Canadian waters would not take a fly. We have had similar stories in these times concerning those of California."

S. C. C.

—Trapping in the Ottawa district of Canada has not been successful the past season, and it is evident that fur-bearing animals are becoming scarce.

IMPORTANT. Care should be taken in buying Fishing or Hunting Suits to get a genuine Hubbard Suit and not one of the worthless imitation which are being put on the market. The best is the cheapest.—Adv.

CLOUDS AND SHOWERS OF QUAILS IN CALIFORNIA.—We have heard of the abundance of quails in California, so great in certain sections as to be voted a nuisance by the farmers who devise all sorts of contrivances for their destruction; but we never expected to hear of their flying in clouds like the myriads that fed the congregated camps of the Israelites in Scriptural times. Surely, in that favored country, whatever the blessing may be, "it never rains but it pours." Now read what we find in a copy of the *San Barnardino Argus*, and put up your shot guns—sell them for old iron—cut them into sections for binoeles—you will never want them any more if you will only hunt in California. Like the green Irishman in America, who discovered a half-sovereign in Gold street—"all yez hav to do, is to stoop down and piek them up!"

"AGUA MANSA, CAL., March 30th, 1876.

"*Dear Argus:*—Seven miles west of Riverside, on the road to Spadra, is a beautiful valley called Sicamore Cañon. It is used by Francisco Alvardo as a sheep ranch. On approaching it I saw a dark cloud and heard a distant noise, and soon discovered that it was a great cloud of quails; they came by the thousands; the air was darkened with them; the cloud was accompanied with a noise that could have been heard at a long distance. The valley was so covered with them that an army of hungry men might have eaten to their fill. I had never seen or heard of such a case before, and strange as it may appear, there was a bright plumage on the quail's heads about four inches long.

"THOMAS B. KIZER.

Not the least remarkable part of this story is that the *Argus* believes in it, and actually vouches for the veracity of the relator, whose statements are authenticated and confirmed by other witnesses. Would that these showers of quail might immediately follow the showers of grasshoppers that plague the vast areas of Kansas, Nebraska, and Minnesota. *Quail on toast!* Why, the amount of grain they would save if made into toast, would not only provide provender for all the inhabitants of those States, but furnish a "bang-up" dinner at Delmonico's or the Hotel Brunswick, for all the gourmands and epicures of Gotham.

By the way we notice with pleasure, that our esteemed contemporary, the *Turf, Field, and Farm*, is urging the introduction of foreign quail into this country for propagation. It is well, but of what need, when we have such an inexhaustible supply at our very doors; yea, even at the Golden Gate of the Pacific?

FIXTURES FOR THE CENTENNIAL.—The Centennial Commissioners have issued the following circular naming the proposed dates for the exhibition of agricultural products, live stock, trials of speed, etc:

AGRICULTURAL PRODUCTS.—Pomological products and vegetables, May 16 to 24; strawberries, June 7 to 15; early grass butter and cheese, June 13 to 17; early summer vegetables, June 20 to 24; honey, June 20 to 24, raspberries and blackberries, July 3 to 8; Southern pomological products, July 18 to 22; melons, August 22 to 26; peaches, September 4 to 9; Northern pomological products, Sept 11 to 16; Autumn vegetables, September 19 to 23; cereals, September 25 to 30; potatoes and feeding roots, October 2 to 7; Autumn butter and cheese, October 17 to 21; nuts, October 23 to November 1; Autumn honey and wax, October 23 to November 1.

FIELD TRIALS.—Mowing machines, tedders, and hay rakes, June 15 to 30; reaping machines, July 5 to 15.

LIVE STOCK.—Horses, September 1 to 14; dogs, September 1 to 8; neat cattle, September 21 to October 4; sheep, October 10 to 18; swine, October 10 to 18; poultry, October 27 to November 6.

The above dates may be favorable for the assembling in Philadelphia of societies and associations interested in the specialties above enumerated.

The right to amend or annul this circular is reserved.

A. T. GOSHORN, Director-General.

BURNET LANDRETH, Chief of Bureau of Agriculture.

Philadelphia, April 1, 1876.

FREE PASSES AT THE CENTENNIAL.—We commend to the public the following very sensible views from our esteemed contemporary, the *Scientific American:*—

"Every politician in office, every newspaper man, in fact everyhody who can conjure up even the shadow of a reason for the privilege, deems himself entitled to enter the Centennial grounds free, and the consequence is that the Commission is unable to fix any limit as to where this deadheading shall terminate. It seems to us that there is one, and but one solution, to the problem, and that is to issue no free passes at all. It must be evident that, in order that the Exposition shall pay back the money invested in it, a very large daily attendance will be requisite, even at fifty cents per head admissiou. Every free pass given, therefore, is simply a diminution of receipts, and when the number of passes swells, as it easily may, into thousands, the loss will be one to make itself felt. This deficit will have to be made up, and there is only one source available, and that is the pockets of the general public; so that, reduced to its simplest terms, the pass system involves the payment by the people for the admission of a privileged class. Of this class the individuals are ten times better able to pay for themselves than half the masses who will flock to Philadelphia.

"The only people who should have free entrance are the employees of the Commission, the exhibitors and their servants, and the judges. The only exception we would have made to the fixed tariff would be in favor of working men. It would be a sensible act for the Commission to sell them tickets at a reduced price."

—Lake Pontchartrain, below New Orleans, though some hundred of square miles in extent, is fast filling up by deposits from the waters of the Mississippi, both from crevasses which often let the waters across to the lake, and from settlements by the eddying of the waters as they flow round from the gulf. The annual filling up of this lake about four or five inches a year, and even within the time of the settlement of our country, has changed it from a salt to a nearly fresh water body, and the fish have all changed their quarters accordingly.

GAME PROTECTION.

PROTECTION IN MAINE.—The sportsmen of Washington, Maine, recognizing the necessity of some organization which shall have for its object the enforcement of the laws relating to fish and game, have issued a call looking to the formation of a club to be known as the Washington County Game Association. They say in their call:

"In this portion of our State, deprived as we are of many conveniences and luxuries, we yet have many sources of recreation, many sporting privileges which, if judiciously preserved, might be continued to us for years, and even exhibit an annual increase. But, on the other hand, a wanton disregard of existing laws, an indiscriminate onslaught upon the treasures of our woods and streams, and in a few years more we may idly wander through fire-seathed, *game-less* forest, count our last partridge, and include upon our list of *exterminated species*, the names of the deer, wild duck, and trout.

Now we appeal for co-operation to every lover of the gun and rod, to every man who recognizes the distinction between reckless butchery and a fair matching of 'skill against skill;' between the wholesale slaughter of deer, with dogs and during unseasonable months, or the occasional shooting of a single deer, within the few weeks which natural and civil laws designate as 'a proper season;' between the pot-hunter' who greedily 'bags his pounds of flesh,' or the man who delights in the health-giving air of wooded hill and balsamic lowland, who appreciates the charm of forest and lake—not voiceless and deserted—but, as the Great Giver intended, the habitat of active life and harmless increase."

—The New Hampshire Fish and Game League, at its annual meeting at Manchester, appointed a committee to confer with New England sportsmen, in order to secure uniform game laws in contiguous States.

—Our correspondent "Seneca," complains of the violation of the game laws in Onondago County. He says, (April 17th):

"Parties fish with dip-nets every day in Onondaga Lake, or its tributaries, and are unmolested, though Syracuse brags of two sportsmen's clubs whose objects, (according to the constitutions) is 'the enforcement of all laws and ordinances against the unlawful killing or selling of game and fish.' While I was out on the above lake last Wednesday after ducks, (unsuccessfully) I counted eleven of these nets in operation, though none of them seemed to be taking many fish. I was told by one of the operators that the principal catch was made at night, and that he had taken seventy pounds of fish the previous night, among them a "lawyer" weighing twenty-five pounds.

MINNESOTA.—We noticed recently the formation of the the Lake Popin Sportsmen's Club. Our correspondent, Dr. D. C. Estes, writes us from Lake City under date of April 7th, as follows:—

"As a club, we are making calculations to properly entertain all sportsmen that may come this way this season. Every member is to keep an accurate record of all game killed and every fish caught, with notes and incidents relating thereto, so when winter comes again, you see, we will have a fine time in our club meetings, in looking over these records and comparing notes. And then again you see, we shall find items for letters which no doubt will prove interesting to all. Aside from this every member is to make an effort to secure something for our collection, which is already large."

—We are glad to learn that they are taking hold of the game laws in good earnest in the Southern States. There is great need of a law regulating the killing of game which is done indiscriminately and at all seasons. Our correspondent "Guyon," of Corinth, Mississippi, writes:—

"We have a game law at last, such as it is, but as the old fellow said about some bill that he tried to get through the Texas Legislature, 'Owing to the astuteness of some of the members, and the tootasness of the rest, it is not what it should be.' It protects all birds and game animals from May 1st to September 15th. We have secured the services of the best lawyer in our city to prosecute offenders, and we will give them the best we've got in the shop if they do violate this law."

The following are the leading provisions of the hill:—

SECTION 1. Be it enacted by the Legislature of the State of Mississippi, That it shall be unlawful in any place in this State to catch, kill or injure, or pursue with such intent any wild buck, deer, doe or fawn, between the fifteenth day of May and the fifteenth day of September; and it shall be unlawful to catch, kill or injure, or pursue with such intent any wild turkey, between the first day of May and the fifteenth day of September; and it shall also be unlawful to catch, kill or injure, or pursue with such intent any quail, sometimes called partridge, between the first day of April and the fifteenth day of September; and it shall be also unlawful to catch, kill or injure or pursue with such intent, any turtle-dove, sometimes called mourning dove, or any starling, commonly known as field lark, between the first day of April and the fifteenth day of September; and it shall be unlawful at any and all seasons to catch, kill or injure or pursue with such intent, the mocking bird, cat bird, or thrush.

SEC. 2. Prohibits the destroying the nests of any wild bird whatever, excepting crows, black-birds, etc.

SEC. 3. Makes it unlawful for any person to purchase or have in possession any of the birds or game mentioned in section one.

SEC. 4. Relates to and prohibits transportation of game during the close season.

SEC. 5. Names the fine as not less than three or more than ten dollars for each bird, and from ten to twenty dollars for each buck, doe or fawn.

SEC. 6. Relates to mode of prosecution.

SEC. 7. Relates to informers moities.

SEC. 8. Specifies the duties of sheriffs, constables, market masters, etc., under the act.

SEC. 9. Relates to trespass upon posted lands, the fine for same being not less than ten or more than fifty dollars.

Speaking of this hill our attentive correspondent, G. E. Eyrich, of Jackson, says:—

"It was signed by Gov. Stone, March 31st. The law met with a good deal of opposition from some of our Representatives, who 'wanted to hunt foxes in winter and deer in the summer,' etc.; the clause to prohibit trapping and netting partridges had to be stricken out, or else the Bill could not have passed, as a great many gentlemen in the House consider netting the acme of sport; at any rate they cannot eat them around here as the birds, having been shot at so much, will not drive worth a cent. Next session we will go for the trap in an amendment.

The law is at least a break in the old monotony of killing any and everything all the year around; as it is the law will be a dead letter, except near large towns. I am in hopes that we shall be able to form a club here to enforce the law around Jackson." Game clubs are now being organized in different parts of the State.

—Canadian Game Laws are evidently a nullity if they can be violated with impunity, as is shown in the following statements from the Ottawa *Free Press*. We are glad that there appears to be even a disposition to abate the evil and that the *Free Press* is lending its assistance. "The depth of snow this spring, and the crust formed after the moist weather, have exposed moose and red deer to the mercy of dogs and men. We are told that in the Gatineau and Coulogne regions several hundreds have been killed, their skins stripped off and the meat left to rot in the woods. Further east and south, on both sides of the Ottawa River, red deer have been hunted down and killed almost daily. Within fifteen miles of this city, near Eastman's Springs, seven were chased out of their yards the week before last and killed by settlers. It seems to be a common practice in the adjoining townships to let deer hounds and curs run loose among the deer yards, and drive out the animals so that the farmers and others can kill them near their houses and hide the carcasses at once. The local magistrates everywhere appear to think it no duty of theirs to enforce the game law. These poor animals are now perfectly helpless, the does having fawns, and the deep crusted snow preventing all chances of escape. The local governments should certainly do something to cause their statues to be respected, and the legislative assemblies ought to attach some responsibility to the owners of dogs which run these deer and worry their young, just as is done to protect sheep and lambs. We would suggest to sportsmen in this city the immediate collection of a fund to employ detectives and send them to find out the offenders, and trace up the owners of dogs doing so much mischief, and follow up the information obtained so as to make some severe examples."

For Forest and Stream.

THE END OF MR. BISHOP'S LONG JOURNEY.

THE "CENTENNIAL REPUBLIC" EN ROUTE FOR THE NORTH.

IN my wanderings up and down the rivers and lakes of Florida, I have met with many persons who had seen Mr. Bishop on his voyage, in the paper canoe, last year. The frequent mention of the name of one who had performed the wonderful feat of rowing from the Gulf of St. Lawreuce to Florida, and the appearance of his in frequent letters (only two, written exclusively to FOREST AND STREAM) kept alive the desire of meeting with him. Knowing that it was his intention to visit Fernandina before leaving for the North, I felt sure of seeing him, but it was only by accident that, at last, the desired end was reached. On the steamer Sedgwick, (last Friday, the 31st March,) among the passengers going North from St. Johns, was a native of New Jersey, who recognized, in passing, in the St. Mary's River, a Barnegat "sneak box." It was being propelled at a rapid rate, with long powerful strokes, towards the town of St. Marys, a few miles distant. We were convinced that it was Bishop in that boat, and strengthened in our convictions when the steamer blew him a long salute. The news of his arrival spread rapidly in St. Marys, for it was here that he received the most delightful tribute to his skill and courage last year, in the torch-light procession, the speeches of welcome, and hundreds of bouquets given him on the 24th of April.

Hastening to offer my congratulations, I found him in the hands of Mr. Fordham, the owner of Orango Hall, who insisted that he should first have something to eat and drink, and hurried him forthwith to the house. In the evening I called upon him with a friend and found him apparently fresh and strong, though rather sleepy. We, however, went over the voyage that evening, and from the notes given me then, and from our conversation during the two days we spent together in lovely St. Marys, I extract a few items of interest to the readers of FOREST AND STREAM. The last letter, you will remember, was sent from Apalachicola. From there, through Crooked River and Oklokonee Bay he passed into open Gulf waters and up to St. Marks. Here he received many attentions and proceeded on his journey after a short delay. All along this coast to the Suwanee River are immense marshes dotted with palms, and with long stretches of forest, oak and cedar swamp, massed behind them. The water is very shallow, and five miles from shore a depth of seven feet only is obtained. A strong gale off-shore will quickly reduce this depth of water to two feet, making especially hazardous an extended cruise along this coast. The details of the voyage from St. Marks were meagre, as Mr. Bishop groups and generalizes his facts in a manner that renders them only valuable to himself, or an eye witness who can afterward elaborate at leisure. That he kept both eyes open, however, his conversation attested, and I doubt if there is anything of interest to be seen and noted that he has not made a note of. At St. Marks, he obtained information respecting that "volcano;" but this, as well as his theory regarding it, I withhold for the present, considering it too valuable to lightly throw away.

At Dead Man's Bay occurred an incident that serves to illustrate his camp life. In the morning, after camping at night in the "Devil's Wood-Yard"—whether so-called from the character of the country, the fuel, or the inhabitants, I cannot state—as he pushed the little boat from shore, a man who had shared his camp discovered, lying in the mud, an alligator the length of the boat. From every indication, it had lain there all night with but a few inches of water between itself and the little boat—the Centennial Republic. Considering that it had had glory enough for

a season the 'gator moved upon the creek, incited thereto, probably, by a point-blank discharge of musketry. Here, about this bay, are splendid cedar hammocks with cedar squaring a foot, and the surrounding swamps are noted for their wildness, containing cattle never branded, who roam through these pastures secure from the hand of man.

In two days from Dead Man's Bay, the Horse-shoe Bay beyond Bowlegs Point, was reached, where the U. S. Coast Survey schooner "Ready," in command of Mr. Perkins, was at work. He was invited to their camp, and aboard the vessel, and was shown every attention that this department—ever attentive and courteous—could furnish. The marshes, vast, far-reaching, seem to have made strong impression upon him, from their very monotony, perhaps, in sight day after day, their waving billows unbroken by trees for miles; the sun glancing from a thousand plumed heads, reflecting their peculiar shimmering light, aggregating an immensity that wearied the mind to contemplate. When we reflect that he has had hundreds of miles of this monotonous marsh, with equally monotonous and level reaches of sand, that he has pulled steadily at the oar a thousand miles probably, in the aggregate, through such scenery, with no breezy bluffs to relieve the strain, no rugged cliffs to feast the eyes upon, we can begin to realize the dogged perseverance of the man. There is nothing so wearing and wearying as a dead-level to one who is traveling, whether by land or water. Innumerable creeks ran up into these marshes, and what may seem very strange, in these salt water creeks, he found fresh springs of water bubbling up, springs charged with sulphur, magnesia, and other mineral salts. His last camp was at the mouth of the Suwanee River, where he terminated his canoe voyage of last year, from the St. Lawrence to the Gulf of Mexico. Here he completed the circuit; he had joined together the waters of the Great Lakes and those of the Ohio and Mississippi. Here ended his studies of the great natural highways of the continent. Five thousand miles in a light canoe and small duck boat, had he rowed and paddled, studying the lakes, rivers, and lagoons, in a manner never so thoroughly done before—not likely to be again.

The day ended clear and bright. The sun sank beneath the waters of the Gulf, lighting up the marshes and bringing out in strong relief the only living object in sight, an alligator. The picture was one to be long remembered. The white sand heaved up from the blue water, shimmering in the leveled rays of the setting sun; the grim alligator, his usually repulsive form changed and glorified, clad in a mail of golden armor. The evening breeze rippled the water and tossed the little craft gently about, as its owner slept in camp for the last time.

The Suwanee, famed in song and story, was the river of all rivers in which to end a voyage so remarkable in its character and extent.

The next morning he rowed to Cedar Keys, being obliged to keep a mile from shore to obtain a foot of water till near that place, as an off-shore wind was blowing. Here he was most agreeably surprised in several ways. He found awaiting him, from the Southern Boat Club, of New Orleans, a silk flag, a duplicate of their own pennant. As Mr. Bishop had avoided so far as possible—all publicity—had, in fact, remained hidden in the marshes below the city, while detained by bad weather, and had but a few minutes conversation with any member of the club, such a token of their esteem was wholly unlooked for. It assists in illustrating the fact that courage and bravery are recognized wherever found, and to those who need repeated assurance of the good will of the best class of southern citizens, such a gift, to a Massachusetts man, may prove significant. It may show them that, were politicians fewer, more frequent would be such demonstrations of peace and good will. Whatever its significance, our northern readers will appreciate the gift of these noble citizens of New Orleans. The flag will be described in a future letter. Another mark of esteem was shown him by the Hon. Mr. Yulee, of Fernandina, who, as President of the railroad line from Fernandina to Cedar Keys, had telegraphed instructions to forward Mr. Bishop and his boat, free of expense to Fernandina. This was wholly unsolicited, for, from beginning to end, Mr. Bishop has paid his own expenses, and he has been particularly careful that no man, in his long journey, could say that he was making the voyage for money. As an evidence of watchful regard for his comfort, this effort of the President of the Florida road was particularly acceptable. Upon his arrival at Fernandina he was captured by the members of Mr. Yulee's family, and taken in their carriage to the beach, and afterwards to dine with them. The boat having been placed in the water, was taken possession of by the young ladies, who exhibited a proficiency at the oar that astonished Mr. Bishop, who received thus convincing proof that culture and refinement were not incompatible with a taste for athletic exercise. After bidding *adieu* to his kind friends, Mr. Bishop left Fernandina for St. Marys. But as it was late that night before he struck the St. Marys River, he camped on Cumberland Island, rowing to town the next morning where he was first seen by me.

This, in brief, has been his experience since he last wrote. He is now stopping at St. Marys, where he has a fine little property, and will leave that place on Friday next, on the Sedgwick for Savannah, thence home. His boat will be shipped to Philadelphia, where it is to be exhibited at the Centennial.

We have pretty thoroughly talked over the voyage together, and I have found Mr. Bishop as companionable as he is modest and brave.

The voyage will foot up about 2,700 miles. During the the whole four months no sail was used, and oars alone were used in propelling the boat. It speaks well for the builder of this little craft that she does not leak a drop, and seam or joint can hardly be discerned. Mr. Bishop has slept in the boat nearly every night while on the journey, and has found her just the boat for his use. Regarding her sea-worthiness I can speak from a little experience, having rowed her from St. Marys to Fernandina against a head tide, a heavy wind, and part of the way over a chopping sea. She rode the waves like a duck, and was as safe as a house. This was the last time she was in the water. FRED BEVERLY.

The Kiowa Indians, twenty-four in number, who are confined in the old fort at St. Augustine, Florida, planned an escape a few days ago, but their little game was spoiled by Pedro, who peached on his comrades. All of the conspirators were placed in separate cells, and the ring leaders were put in chains.

The Kennel.

THE KENNEL REGISTER.

WE shall feel obliged if those gentlemen who have applied to us for pedigree blanks for the purpose of registering their dogs in the Kennel Register, will return them to us filled up as early as possible. We propose taking the Register to Springfield to be open there during the Rod and Gun Club Bench Show, when all who desire to do so can register their dogs. We shall also have a supply of pedigree blanks with us. The entries in the Register for the week ending Tuesday, April 18th, are as follows:—

SETTERS.—Mr. Plimpton's Juno; Mr. Huidekoper's San Miguel; Mr. Simpson's Mersey; Mr. Underhill's Waif and Maud; Mr. Donoghue's Daisy and Brussel; Mr. Fay's Fox and Belle; Dr. J. Fleet Spier's Duke, Dick, Daisy, Joe, Fan, and Gypsum.

We note with some amusement a remark in the Chicago *Field*, that "Mr. Burges had no sooner published his book than it was immediately imitated by a contemporary." In order to satisfy ourselves that there was not the slightest ground even for such an accusation, we addressed Messrs. J. B. Ford & Co., the publishers of Mr. Burges' book, a note, to which we received the following reply: "It was published Saturday, March 4th, 1876," J. B. F. & Co.

Now as we gave notice of the establishment of the Register in our issue of February 10th, the book having been prepared some time previously, we can scarcely be accused of taking the idea from Mr. Burges, whose long promised book had been so delayed that it had come to be looked upon as something mythical. This is by no means the first occasion, however, when mis-statements regarding this paper and its affairs have emanated from the present editor of the Chicago *Field*, and, while we can admire a young journalist's efforts at "push," we would remind him that repeated misrepresentation is more likely to lead him to untimely grief than to result in the success at which he aims.

—Mr. Jno. T. Underhill, of Tuckahoe, N. Y., claims the names of "Waif" for a black setter dog with white feet and nose, and "Maud" for a black setter bitch, feet, nose, and eye marks, tan, small white spot on breast; both by Allerton's Shot, out of Wesson's Nellie.

Mr. Joseph E. Fisher, of Brooklyn, claims the name of "Royal Duke" for his red Irish setter pup, whelped December, 16th, 1875, out of his Belle, by Hamilton Thompson's Duke, (American Kennel Book 114).

—We are informed by Mr. Theodore Morford, of Newton, N. J., that he has sold his red Irish setter, Ranger, to Mr. J. H. Whitman, of Chicago. Ranger is the red setter imported by Mr. Jenkins, of Baltimore.

KENTUCKY STATE SPORTSMEN'S ASSOCIATION.—This association holds its second annual meeting, at Lexington, from May 9th to 12th inclusive. In addition to the pigeon shooting, there will be held, commencing on the 10th, a Bench Show of dogs. The following is a synopsis of the prize list:—

CLASS 1.—Imported English setters, or their progeny, over one year.
CLASS 2.—Imported red, or red and white Irish setters, or their progeny, over one year.
CLASS 3.—Imported black and tan, or black, white, and tan Gordons, or their progeny, over one year.
CLASS 4.—Native English setters, over one year.
CLASS 5.—Native red, or red and white, called Irish setters, over one year.
CLASS 6.—Native black and tan, or black, white, and tan, called Gordons, over one year.
CLASS 7.—Pointers over 50 pounds weight.
CLASS 8.—Pointers under 50 pounds weight.

In all the above classes there are two cups and two diplomas each for dogs and bitches.

SPECIAL CLASSES.

CLASS 9.—Best native English setter puppy, under one year.
CLASS 10.—Best English setter puppy from imported setter, under one year.
CLASS 11.—Best pointer puppy, under one year.
CLASS 12.—Best English setter bitch, with two of her puppies, under one year.
CLASS 13.—Best Irish setter bitch, with two of her puppies, under one year.
CLASS 14.—Best pointer bitch, with two of her puppies, under one year.
CLASS 15.—Best imported English stock dog, with two of his puppies.
CLASS 16.—Best native English setter dog, with two of his pups.
CLASS 17.—Best red, or red and white Irish setter dog, with two of his puppies.

In all the above classes there are three prizes, one cup and two diplomas. No entrance fee is required, and the said roads of Kentucky will carry dogs to and from the show free of charge.

EDITOR FOREST AND STREAM:—

As the managers of the coming bench show at Springfield, have made arrangements with the New York, New Haven, and Hartford R. R. Co., to put an extra baggage car on the 3 P. M. train, of Tuesday the 25th, would it not be well if all those persons who intend sending their dogs, were to notify your paper of the fact, stating the number of dogs going so that you could send word to the Company on Tuesday morning, and thus enable them to have sufficient accommodation prepared for the animals. I for one shall go up in the above train with certainly seven dogs, and perhaps ten or twelve. I believe all dogs will be transported free of charge, provided some one accompanies them. GROUSE.

We are informed that the New York, New Haven and Hartford Railroad will carry all dogs to and from the Springfield Bench Show free of charge, and the suggestion of our correspondent as to gentlemen advising us of their intentions of sending their dogs is a good one. We will see that the railroad authorities are notified.

NAMES FOR DOGS.—The Worcester *Gazette* prints some statistics taken from the records of the county clerks office, where dogs are registered, by which it appears that he has this year licensed 1,606 dogs, of which 161 were bitches. In the first 250 names Jack is entered eighteen times, while Jip appears nine times, Carlo eight times; Fido, Major, and Rover, seven times each; Don, Skip, Fanny, and Prince, six times; Dick and Spot four times; Topsy, Pedro, Captain, Sport, Fan, Dash, and Nellie, three times; Tige, Tiger, Jennie, Beauty, Sailor, Ned, Bruno, Charlie, Pink, Dick, Shepherd, Dot, and Dan, twice each; and beyond these a list of single names as Major, Zack, Spry, Duke, Ben, Ned, Pomp, Lion, Nero, Dick, etc., all of no special merit as names, or of oddity in application.

But there is oddity in the list, for one man calls his dog Bunkum, and another calls his Nigger, while Punch, Hauer, Duke of Kent, Pat, Sporter, and Wallace, are in the first two hundred and fifty names. Beyond these, all along the list of prosaic names we find such gems as Smartie, Bruiser, Pup, Patsey, Joke, Cutie, Turn, Gunner, Squiz, Gash, Gaston, Bear, Toady, Boss, Teaser, Doctor, Savage, Troy, Prime, Sig, Gloster, Sweep, Basher, Chico, Pilot, Wag, Tottle, Lady, Braman, Toupeti, "Dog," Neat, Danger, Moses, Scamp, Calvin, Chubba, Pepper, Saint, Josh, Chance, Carl, Rosa, Deacon, Tag, Steamer, Bender, Brandy, Posey, Merite, Turker, Curl, Judge, Mixey, Rather, Luke, Guess, Dutchman, Doggie, Shady, Slumbo, Web, Snib, Lucky, Limpey, Heater, Button, Faith, Joker, Primp, Veto, Rupee, Chippy, Satan, Loafer, Keeper, Smoker, etc., etc.

IRISH SETTERS—FALSE PEDIGREES.

KILLALOE, Clare county, Ireland, March 23d, 1876

EDITOR FOREST AND STREAM:—

I desire, through your accomplished columns, to put breeders of American, as well as Irish sporting dogs in America, on their guard against a certain party on this side of the Atlantic, who, for some time past, has been exporting to the States so called Irish setters with fictitious pedigrees. Two years ago the person to whom I allude could not tell you the difference between an Irish setter and an English mastiff; he never had a dog of any kind trained for him in his life, nor ever saw a bird shot over a dog. About eighteen months ago, however, he chanced to get in exchange for a mongrel Irish water spaniel puppy, daubed with white (worth about half a dollar) an old cast-away, mangy setter bitch of a certain strain. It took him fully six months to even partially cleanse her of the abominable disease, after which he got her warded by one of the ugliest-looking dogs in Ireland. In due time five *yellow*-red puppies came of the union. Of these, three hardly survived the whelping, the other two died in about two months. These were the only puppies he ever had out of the old bitch, which latter he sold six or eight months ago for a few pounds. As to the bitch herself, she had no pretentions whatsoever to quality or style. Her color was a bad yellow-red, her head was as thick as an English bulldog's, she had not a particle of feather, and was untrained; yet on the strength of this scurvy old bitch he got printed a flash pedigree the length of my arm, which he sends to any one simple enough to write to him for a dog. Whenever he receives from America or elsewhere an order for an Irish setter, with the money of his dupe in his pocket, he scours the country round in quest of some red mongrel, which he generally picks up for a mere trifle, and then sends abroad under a false pedigree, in the meantime netting a nice sum by the transaction.

I sincerely trust that FOREST AND STREAM, as well as its many distinguished sporting contemporaries in America, will lend their powerful aid in putting down this barefaced swindler S. F. HARNEY.

P. S.—I send with this a copy of an Irish Provincial newspaper, in which you will notice an advertisement from our friend for a brace of all red trained setters and two brace of puppies. Now, I happen to be aware that he has at this moment in his pocket an order from America for a brace of trained dogs, and as he has not the like in his possession —I beg pardon, I mean in his "celebrated kennels"—you will see by the advertisement how he means to come by them. A nice little game, this, is it not?

[We should feel under obligations to our correspondent if he will mention the names of some of the dogs exported with false pedigrees. It is of importance to all sportsmen that this question should be ventilated, and that not only should a stop be put to such nefarious practices as those alleged, but that if we have dogs among us sailing under false colors that the fact should be known.—ED].

MR. BURGES' BOOK.

SING SING, N. Y., March 19th, 1876.

EDITOR FOREST AND STREAM:—

I wish to say a few words about Mr. Burges' work. "The American Kennel and Sporting Field," which I have lately received and read. I ordered the work without seeing it, expecting, from what I had heard of Mr. Burges, that he was competent to handle the subject properly, and that it would be, as the title warranted (and also the price), an exhaustive treatise on the Kennel and Field, one from which the amateur could derive (as far as reading goes) all necessary information in those branches. But after reading it I found my mistake. It owes its value, not to the amount of solid information it contains, but to the fancy decorations of the publisher; and its bulk to thick paper, wide margins, and large type; and shorn of these superfluities, which render it desirable as an ornament, but detract from its practical value, it would be reduced to one-quarter its present size and cost.

Now, I do not think that this is the book to meet the requirements of those who, like myself, seek for a text book by which they may become well posted in everything pertaining to the sporting dog. I do not say that what matter it does contain is not good; but I do say that the principal topics are treated in a very cursory manner, and are largely borrowed from works that have been long extant and accessible to every sportsman in the land, and the whole thing may be looked upon as a superficial abridgement, and *not* a thorough treatise.

And now I have made this statement, let me endeavor to prove it. The chapter on breaking, which I think is one of the most important topics, after being augmented by large type and plentiful margin, contains but thirty and one-third pages, and even these are largely taken up by methods for breaking old dogs and teaching setters to retrieve in water, leaving but a very meagre space for the much more important part of breaking young dogs to common field and cover shooting. It may be said that this art is not to be learned from books, and that experience and practice are the only teachers; but nevertheless I do not think he has done it justice. The chapter on the diseases of dogs and the proper treatment of them, is mainly drawn from Mayhew, which is well enough, for his methods are probably the best. But since in the small space that Mr. Burges devotes to this large subject, he cannot pretend to give more than a mere epitome of Mayhew, and because of the disastrous consequences which may follow from lack of thorough knowledge, had we better not consult Mayhew unabridged and be done with it? The subject of food is disposed of in less than half a page. Now, one would suppose in such a treatise as this pretends to be that a good deal of valuable and very necessary information should be given here, since in health and usefulness of a dog must depend, in a great measure, upon his food. In fact, a point can hardly be found in the whole book upon

which I could not ask a great many questions, which should be answered in the pages. It may be said that my ignorance is deplorable, but if one knows all about such things, he has no need of my book, and if he does not, he wants a book that will tell him. And just here, I think, lies Mr. Burges' fault. He knows so much himself that he overlooks the necessity of going into details for the benefit of those less learned. And, moreover, there are numerous points, legitimately pertaining to the subject, which he ignores entirely; for instance, the period of gestation of the dog, all remarks on the size, shape, and general structure of the kennel itself. In other words, he has made a small book out of what—in order to do any justice to its title—should be a large one, and the worst of it is that its high sounding title and corresponding price, and the name of the author, are apt to deceive those who are obliged to order it unseen into a wrong estimate of its real practical value, as they did your humble servant. VINDEX.

CLUMBER SPANIELS.

ST. LOUIS, Mo., April 10th, 1876.

EDITOR FOREST AND STREAM:—

I was well pleased to see in the FOREST AND STREAM of April 6th a communication from "B. S., of Kentville, N. S.," having had the pleasure of shooting woodcock over his dogs in the autumn of 1874, and thoroughbred little fellows they are indeed. I hope that I may see much more from the pen of B. S. in the columns of FOREST AND STREAM. Will he report the advent of migratory woodcock and snipe in the autumn for the benefit of New England sportsmen? And since he cannot hunt moose in Nova Scotia this year, let us have an occasional hunt on paper, and many readers will accompany him in spirit. The hunting days of my setters that he admired so much are now over, but I can show him a pair even superior to them when the opportunity arrives, which I hope it may ere another twelvemonth passes. ROAMER.

The Rifle.

CREEDMOOR.—The first out-door match of the season was shot at Creedmoor on Saturday last, the occasion being the contest for the Luther Badge, at long range. The weather was very unfavorable, the wind blowing half a gale across the range, and the scores made much below the average. There were sixteen entries, the conditions being two sighting and five scoring shots at 800, 900 and 1,000 yards. The following are the scores of all the contestants excepting Messrs. L. Webber and T. Hyde.

Names.	Yards.	Score.	Total.	Gr. total

So strong was the force of the wind that Capt. Anderson, whose wind guage was too short to permit of his making the proper allowance at 900 and 1,000 yards, aimed at No. 5 target and actually succeeded in hitting No. 6 nine out of ten times. The Luther Badge has now been contested for seven times, and the contest for it promises to be one of the standing events of the season.

CREEDMOOR JR.—The return match between teams of six, representing the employes of Howard, Sanger & Co., and the New York Life Insurance Company, took place at this range on Saturday, resulting in a victory for the latter by the score of 227 to 218.

The 2d Gold Badge of the U. M. Co. competitions was won by Mr. D. H. Stephens, of Riverton, Conn., on a total score of 210 out of a possible 250. The 3d prize was won by J. McGlensey, with a score of 209. The All-Comers Gold Badge was also won by Mr. McGlensey with the fine score of 223, out of a possible 250.

ANOTHER MATCH WITH THE IRISHMEN.—A meeting of the Executive Committee of the Amateur Rifle Club was held on Monday last, the principal business of which was to consider a reply to the following challenge:—

IRISH RIFLE ASSOCIATION, No. 110 GRAFTON STREET,
DUBLIN, March 22d, 1876.

MY DEAR SIR—I have been requested to acquaint you that at a meeting of the Irish Rifle Association, held this day, the following resolution was unanimously adopted, viz.:—

Resolved, That a challenge be sent to the riflemen of America (through the Amateur Rifle Club of New York) to shoot a return match on similar terms to those already shot at Creedmoor in 1874, and Dollymount in 1875, save as to targets and rifles, which are to be Creedmoor targets and "any rifles," according to Creedmoor rules, the match to take place as soon as possible after the conclusion of the Centennial matches.

May I request you will be so good as to lay this communication before your club, and accept it as the challenge which my association desires to offer.

I am, my dear sir, most truly yours,
HENRY H. FOSTER, Honorary Secretary.

To the Secretary Amateur Rifle Club, New York.

The challenge was accepted, and the Secretary directed to acknowledge receipt of the letter.

The bull's-eye trophy offered for competition by Mr. Leonard Geiger, of Hudson, N. Y., was accepted, and Saturday next agreed on as the time for the first competition, Major Joseph Holland acting as executive officer, the shooting to begin at eleven o'clock A. M. sharp. Entries can be made on the range till that time. The match is open to all comers; distances 800, 900, and 1,000 yards; firing to begin at 1,000 yards, at which range 20 shots will be fired; then 900 yards, where 15 shots will be fired, closing at 800 yards with 10 shots; no sighting shots; entrance fee, $1; badge to go to the competitor having the greatest number of bull's-eyes at the respective ranges; to be won three times before becoming property of winner.

—The first match of a home and home series between the Centennial teams of the Newark Shooting Society and New York Shutzen Corps will be shot at the Shooting Park, Newark, N. J., on the 24th inst. There will be prize shooting on the same day, in which all riflemen are invited to participate.

CONNECTICUT RIFLE ASSOCIATION.—The Connecticut Rifle Association, at their meeting in Hartford April 6, appointed a committee consisting of Messrs. Davidson, Hubbard and Pillard to consult with parties interested, and to locate the new range at Berlin, if suitable arrangements can be made with property holders. The site proposed for Connecticut's Creedmoor is near the Berlin junction, eleven miles south of Hartford, on the line of the New York, New Haven and Hartford Railroad, and withal a fine location, being easy of access from the principal cities of the State, and in a locality where a safe range of 1,000 yards can be obtained. It has not as yet been made public what success the committee have had towards securing the land, but it is hoped that the property owners will not stand in the way of the intentions of the association by refusing them the grounds.

BERGEN POINT RIFLE ASSOCIATION.

BERGEN POINT, N. J., April 1st, 1876.

EDITOR FOREST AND STREAM:—

The Bergen Point Rifle Association was organized in the early part of 1875, the membership limited to thirty, which was within a very short time filled with gentleman taking a lively interest in rifle practice, and as a natural consequence one may hear the crack of the rifle upon our range every Wednesday and Saturday afternoon, both winter and summer. We have a 200-yard range, situated near Newark Bay, and a small club house erected on the grounds, which we use during the winter season and stormy weather to shoot from. Our practice is all done strictly in accordance with the rules of the National Rifle Association, and we now think that we can turn out quite a strong team. At any rate we stand ready to try conclusions in a friendly match with any of our New Jersey brethren.

Having just entered upon the second year of our existence, we can justly feel proud of the flourishing condition of the association, and with the warm interest taken by all the members in everything pertaining to the good and welfare of the club, we look forward to many pleasant afternoons, and indeed profitable ones, during the year. We intend making every three months, a quarterly average account of our shooting, which we would be pleased to forward you from time to time, if you think it of enough importance for publication. The following is the average for the quarter ending March 31st:—

Standing.	Names.	No. shots.	Total score.	Average.
1.	J. T. B. Collins	30	125	4.16
2.	F. Schilling	292	1194	4.08
3.	A. R. Warner	110	432	3.83
4.	Dr. J. Hickman	60	227	3.78
5.	J. C. Simmons	10	671	3.72
6.	H. J. Snilson	123	452	3.67
7	A. Vredenburgh	199	726	3 64
8.	H. Meigs, Jr	120	431	3.59
9.	R. V. K. Schuyler	10	35	3.50
10.	L. L. Spring	40	133	3.32
11.	J. Newman	64	209	3.26
12.	Col. C. W. Fuller	70	225	3.21
13.	C. H. Gale	30	95	3.16
14.	Dr. J. Finn	173	545	3.79
15.	S. K. Fox	47	145	3.08

Totals		2142	7366	3.43

A. P. VREDENBURGH, Secretary.

Game Bag and Gun.

GAME IN SEASON IN APRIL.

Wild duck, geese, brant, &c.

GAME IN MARKET.—A few canvas backs coutiuue to come into market from the South, although the season is over and the slight demand has sent prices down to $2 per pair; red-heads are worth $1; wigeon, broad bills, black ducks, etc., from 50 cents to $1, according to quality; wild geese, $1 each. English snipe are very abundant, and fine Jersey birds are selling for $2.50 per dozen; wild pigeons are worth $2.50.

SOME FINE GUNS.—We had the pleasure a few days since of inspecting one of the finest guns we have ever seen. It was made by Messrs. W. & C. Scott & Son, and imported by H. C. Squires for Mr. L. A. Brigham, of Jersey City. The gun is a treble grip "premier" with two sets of barrels, one 10-gauge, weighing 9¾ pounds, and the other 12-gauge, weighing 8 pounds; cost, $400, gold. At the same time we saw another fine gun by the same makers, and imported through Mr. Squires for a very intimate friend of our own. This gun has Messrs. Scott's new patent top action triplex lever grip, the strongest action known, and is a remarkably fine, though plain, gun. It has already acquitted itself on snipe to the entire satisfaction of the owner.

—Large flocks of pigeons are sojourning near Sandy Creek, Oswego County, this State.

—The Onondago County Sportsmen's Club will hold a tournament at East Syracuse at no very distant day, and contest for prizes to the amount of two thousand dollars.

—William Fage and Henry Gale shot for the Onondaga Club medal on Saturday last at Syracuse, and Mr. Fage won by the following score:—

Fage	1 0 1 1 : 0 1 1 0 0 1 1 1 1	11
Gale	0 0 0 1 1 0 1 1 1 1 0 1 0 1	9

SENECA.

NEW YORK—*Rochester April 10th.*—Great flocks of pigeons have been flying over this city, and the woods along the lake shore east and west of the city are full of them. An army of sportsmen have started out for them, and pot-pies will soon be the standing dish.

MASSACHUSETTS—*Salem, April 15th.*—Snipe are along. Your friend "Dry Land" shot the first one the 11th, and there are a few shot every day now. Uplands and killdeer plover are with us. Hawks numerous; other spring migrants are on time; bay ducks scarce; whistlers cleared out; a few sheldrake or mergansus left. I shot two bluebills yesterday afternoon. Weather and grounds "bangup" for snipe. Rifle shooting is taking a start in our vicinity. TEAL.

New Bedford, April 14th.—Birds are beginning to arrive quite freely—snipe, woodcock, etc.; plenty of geese flying northward daily. CONCHA.

CHOKE-BORING.

BUFFALO, N. Y., April 5th, 1876.

EDITOR FOREST AND STREAM:—

The fact of some manufacturers having produced stronger and closer-shooting guns than the old and common bore, has given rise to a great deal of controversy as to whether the new system is an improvement or not. I have read the opinions of such writers as have expressed themselves in your columns, and I believe the new system receives more favor than of disfavor. There certainly is such a thing as carrying it to excess, as men are apt to with all new ideas. They have carried this one too far in some instances, and the evidence in such cases has thrown it into disfavor with a great many. The idea of boring guns in such a manner as to make them throw the shot into a small space is not new by any means. It has been discovered that guns were made with that particular point in view over a hundred years ago. Mr. Pape claims to hold a cup valued at $45, awarded to him for the original(!) invention of choke-boring. It appears to me that his claim to being the original inventor of this system is absurd, to say the least. I have seen no evidence of uniformity of system among the manufacturers in choke-boring. Each one appears to be using the system he happens to be possessed of or thinks is the best. A short time ago you informed one of your correspondents that choke-boring consisted in enlarging the bore a few inches from the muzzle. That system was in use, and probably may be now, by one or more makers, but not by the one who won the field trial of 1875. It seems to me, although I am not a practical gunsmith, such a system must of necessity weaken the gun where the enlargement is, and cause the wear and tear to be much greater.

Since the success of Mr. Greener at the field trial, I have learned that the system in use by him is the invention of Mr. J. O Robson, an old and experienced gunsmith of this city, and was suggested by him when in England a year ago last fall. In conversation with him a day or two ago he explained the system to me as nearly as he could. As you will see, the treatment of the barrels depends on their length. In the shorter barrels, commencing at the breech, the bore is gradually contracted by a certain rule of graduation, to within a short distance of the muzzle, when it is slightly enlarged—hardly enough to be perceptible. Longer barrels are contracted from the breech to the muzzle, forming a perfectly graduated cylinder. There are certain points to be understood and kept in mind when boring that cannot well be explained. In knowing how to graduate the contraction to attain any desired pattern is where Mr. Greener gets his superiority over other makers. It is not the result of guess work or accident when he turns out a gun that will make a pattern of 200 or more. The system has been perfected so he can furnish a gun the exact counterpart of any other made by him.

Some men have seen fit to characterize choke-boring as a great mistake. If they think so they are not obliged to adopt it. We all know that the shooting is not alike in all parts of the country; that in one place where one particular style or bore of gun is very efficient, another one with closer and stronger shooting qualities would be comparatively no good, and *vice versa*. Consequently sportsmen should be charitable toward those whose requirements are not the same as theirs, and who do not think as they do on some particular point or points as to the merit of a system of boring a gun.

Mr. Robson has a lot of guns on the way from Birmingham, which are claimed by the makers, Messrs. Clabrough Bros., to be the best guns they ever turned out, for accuracy, penetration, and pattern. They are bored on Mr. Robson's system. That the system is serviceable is shown by the fact of Mr. Greener's taking the prize for wear and tear.

I forgot to say that the first match at pigeons of the season for the watch presented to the Forester Club by Mr. Robson, will be shot during the first part of May. I hope to give you an account of it.

CHAS. BATTEY.

THE DITTMAR POWDER.

NEWARK, N. J., April, 1876.

EDITOR FOREST AND STREAM:—

In looking through your bright and sparkling paper of the 16th ult., I notice a communication from Mr. Dittmar relative to the merits of his make of sporting powder. As the writer of this communication has had the privilege of experimenting with the Dittmar powder soon after its introduction to the public, some fifteen months ago, and has used and handled it from that time to this, it may not be amiss for him to refer to it again. A full account of these experiments was published in the columns of your able contemporary, the *Turf, Field and Farm*, soon after they were made. I have also compared it with the wood or Schultz powder, and find that, in color, evenness of grain, and freedom from residuum of any kind after firing, I think the Dittmar powder the best; and as the general results of my experiments, I think the Dittmar powder as good for practical purposes in the field as any black powder I ever used, and when you take, in addition to this, its almost perfect cleanliness, freedom from noise and smoke, it has advantages to the persons using it not readily overcome.

The Dittmar powder has some peculiarities, which at present we cannot account for, but which, after all may be the result of our want of knowledge. Among these peculiarities is the difference in the sound of the report at the firing of a gun loaded with it; it makes but little noise at any time, but to my ear there is a distinct difference in the sounds, some being more feeble than others, and this from charges that are as carefully prepared and measured, in regard to quantity, wads, etc., as is possible under ordinary circumstances. This exceeding light report gives the shooter a feeling of want of confidence in this powder (though my experience with it at target practice gives good and equal results in penetration, etc.,) which may have something to do with its want of popularity among sportsmen. A good loud report at every firing of my gun is what I am accustomed to, and whether I bring the game to bag or not, I feel that the powder is all right, and rather take the blame to myself, in case of a miss-fire, than give it to either the gun or powder. Now, it is just possible that being accustomed to a very loud report has something to do with the feeling that the Dittmar powder is not exactly the thing. There is one thing about this powder that I have faith in—it is certainly not more dangerous as an explosive than the black powder in daily use among sportsmen. That guns will be burst in using it I certainly shall not deny; so also do guns burst with use of ordinary black powder. But as gun bursting generally occurs, either from a defect in the barrels or from careless loading, I cannot blame the powder. I think in nine cases out of ten either of the above causes will be found at the bottom of any bursting caused by this powder. The only true way for sportsmen to get at bottom facts, and make up their minds fully about this powder, is to get some, and try such experiments with it as they may deem expedient; they will then be able to talk or write knowingly on the subject. RIP VAN.

—The latest "fish story" comes from California, where it is said that large quantities of wheat have been destroyed by fish during the winter, owing to the submersion of the fields by high water, during which the fish fed on the tender grain roots.

THE NEW

BOSTON SHOOTING SUIT,

Manufactured only by

G. W. SIMMONS & SON,

Boston, Mass.

We offer this season an entirely new design of WATER-PROOF SHOOTING SUIT (made from extra quality duck), in the preparation of which we have been assisted by the advice and suggestions of our best resident sportsmen.

The design embraces the best points of the English and French Suits, combined with the necessary requirements for American service. Particular attention has been paid to color.

Each suit is thoroughly water-proofed by a new patent process. The seams and pocket corners being securely fastened, the arm holes ventilated, and nothing neglected to render the suit perfect in every respect.

The price has been fixed at $13, to include Hat or Double Visored Cap, Detachable Havercock, Coat, Vest, and Pantaloons.

One hundred suits will be kept ready in stock, so that we can furnish to order any size required, at a moment's notice.

In the *Golden Rule* (Rev. W. H. H. Murray's paper) the enthusiastic editor writes:—

"We were shown, the other day, a new water-proof suit, specially adapted for sportsmen, designed, and made up by Simmons & Son, of Boston, and to which we call the attention of all brethren of the out-door and shore-shooting fraternity, because it meets the demand of personal comfort and convenience beyond anything of home manufacture seen by us before. As a sportsman, we give it our unqualified endorsement, as combining the best points of the English suits, and in addition skilfully adapted to the necessities of the American service. It is a most admirable and satisfactory contrivance in color, style, water-proof quality and capacity. The coat is a marvel in this latter respect."

Persons ordering from a distance need send only the following to be sure of a perfect fit:—Waist Measure, Height, Breast Measure, Length of Sleeve, Size of Head.

THE SPORTSMEN'S ROUTE.

Chicago & Northwestern Railway.

This great corporation now owns and operates over two thousand miles of road, radiating from Chicago. Like the fingers is a man's hand, its lines reach in all directions, and cover about all the country north, northwest, and west of Chicago. With one branch it reaches Racine, Kenosha, Milwaukee, and the country north thereof; with another line it pushes through Janesville, Watertown, Oshkosh, Fond du Lac, Green Bay, Escanaba, to Naganuee and Marquette; with another line it passes through Madison, Elroy, and for St. Paul and Minneapolis; branching westward from Elroy, it runs to and through Winona, Owatonna, St. Peter, Mankato, New Ulm, and stops not until Lake Kanaska, Dakota, is reached; another line starts from Chicago and runs through Elgin and Rockford to Freeport, and, *via* the Illinois Central, reaches Warren, Galina and Dubuque, and tho country beyond. Still another line runs almost due westward, and passes through Dixon, Sterling, Fulton, Clinton (Iowa), Cedar Rapids, Marshalltown, Grand Junction, to Council Bluffs and Omaha. This last named is the "GREAT TRANS-CONTINENTAL ROUTE," and the pioneer overland line for Nebraska, Colorado, Utah, Idaho, Montana, Nevada, California, and the Pacific Coast. It runs through the Garden of Illinois and Iowa, and is the safest, shortest, and best route to Omaha, Lincoln, and other points in Nebraska, and for Cheyenne, Denver, Salt Lake City, Virginia City, Carson, Sacramento, San Francisco, and all other points west of the Missouri River.

TO SPORTSMEN:

THIS LINE PRESENTS PECULIAR ADVANTAGES—FOR PRAIRIE CHICKEN, DUCK, GREESE, AND BRANT SHOOTING, THE IOWA LINE TO-DAY OFFERS MORE FAVORABLE POINTS

than any other road in the country, while for Deer and Bear Hunting, and for Brook Trout, Lake Salmon, Pike, Pickerel, and Bass Fishing a hundred points on the Northern and Northwestern lines of this company will be found unsurpassed by any in the West.

FOR SALE, OR TO LET.

The elegant country residence, WILLOW LAKE, at Locust Valley, near Glen Cove, Long Island.

Suitable for Summer Boarding-House.

The house is 2½ stories, frame, 40 feet front and 32 feet deep, with wide piazza front, rear, and on south end. On first floor are parlors, sitting-room, and dining-room; wide hall through the centre. Up stairs are 9 bed-rooms, all large and airy; kitchen well-arranged and convenient; cellar large and dry.

On the premises, and at a convenient distance from the house, are a stable and carriage house, chicken-house, shed, coal, tool, and ice houses. The grounds are well laid out and tastefully planted with ornamental trees and shrubbery. The avenue leading from the road to the house skirts a beautiful lake, on the border of which the house stands. A Paper Mill at the north end of the lake will be sold with the above, subject to a lease. The lake and land embrace about 27 acres. As a place of residence it is elegant and healthy; for manufacturers it is convenient; for the propagation of trout, for pleasure or profit, there is no better place in the State. Apply to

BUY IT Vanity Fair.
It is shaved from the best Natural Leaf, for Meerschaum and Cigarettes. Does not make the tongue sore. Sample on receipt of 20 cents. Highest award, Vienna, 1873. Send for circular. WM. S. KIMBALL & CO.,
PEERLESS TOBACCO WORKS, Rochester, N. Y.

From Seth Green, Supt. N. Y. State Fisheries.

I find Vanity Fair to be the best article of tobacco adapted to the wants of the sportsman. Have used your tobaccos for many years, and know them all to be first-class.

For Sportsmen.

A trusty friend, in weariness or trouble; a solid resource in Winter and rough weather, is a sweet pipe with Vanity Fair. Best dealers have it.

From A. B. Lamberton, Rochester,

Having smoked your tobacco, Vanity Fair, by the camp fire and by the hearth, I believe it in point of fragrance and taste superior to all brands known to me. Being in search of a tobacco that would not fire the tongue and mouth, I was made acquainted with your Vanity Fair, and found it to be the *ne plus ultra* of natural leaf.

For Cigarettes.

A cigarette is an interlude to the serious habit; a graceful make-believe for spare hours. For cigarettes Vanity Fair has no equal. Best dealers have it.

From Forest and Stream, N. Y.

We have received from Messrs. Kimball & Co., of Rochester, some choice specimens of their celebrated Vanity Fair tobacco in neat metal cases holding a pound each; and, after most thorough trial, do not hesitate to concede to it all the good qualities which its manufacturers claim for it. It is a most superior article, and a great comfort to discriminating smokers.

THE
PAPER STEM PIPE.
Just the Thing for Home and Camp Use.

Supplies a want which smokers have long felt—a pipe which shall give simply the taste and odor of tobacco smoke. This pipe never accumulates rank smelling liquid in stem or bowl, but is always clean and sweet. The bowl and mouthpiece are permanent, but the stem is of porous paper, to be laid aside after a few days' use and a new one fixed. Extra stems accompany each pipe. The price of extra stems, when not furnished with the pipe, is as follows: Four and a half and seven inches, 5c.; twelve inches, 15c. Sold by pipe and cigar dealers generally, or a complete sample sent by mail for $1 by

EAGLE DUCKING, EAGLE RIFLE, AND DIAMOND GRAIN POWDER.

The most Popular Powder in Use. Also,

Sporting, Mining, Shipping and Blasting Powder

Of all kinds and descriptions.
For sale in all parts of the country. Represented by
F. L. Kneeland,
Feb 10-1y 70 Wall Street, New York.

The Hazard Powder Co.,
MANUFACTURERS OF
Gunpowder.

Hazard's "Electric" Powder.

Nos. 1 (fine) to 5 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. *only*.

Hazard's "American Sporting."

Nos. 1 (fine) to 3 (coarse). In 1 lb. canisters and 6¼ lb. kegs. A fine grain, quick and clean, for upland and prairie shooting. Well adapted to short guns.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6¼ and 12½ lb. kegs. Burns *slowly* and very clean, shooting remarkably close, and with *great penetration*. For field, forest and water shooting it ranks any other brand, and it is equally serviceable for muzzle or breech loader.

Hazard's "Kentucky Rifle."

FFFG, FFG, and "Sea Shooting" FG, in kegs of 25 12½, and 6¼ lbs. and cans of 5 lbs. FFFG is also packed in 1 and ½ lb. canisters. Burns strong and *moist*. The FFFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard *Rifle* powder of the country.

SUPERIOR MINING AND BLASTING POWDER.

GOVERNMENT CANNON AND MUSKET POWDER; ALSO SPECIAL GRADES FOR EXPORT, OF ANY REQUIRED GRAIN OR PROOF MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's agents in every prominent city, or wholesale at our office.

88 Wall Street, New York.

CELEBRATED
American Dogs.
Fine Engravings on card boards, ready for framing, of the following celebrated dogs:—
Pure Laverack Setter Pride of the Border.
Pure Laverack Setter Fairy.
Imported Red Irish Setters Dash and Bess.
Red Irish Setter Dick.
Celebrated Dogs Peg, Don, and George, after painting by Bispham.
Black Pointer Whisky.
Liver and White Pointer Ranger.
Black Pointer Pete.
Price 25 cents each, postage paid. Address
FOREST AND STREAM PUB. CO.,
17 CHATHAM STREET, N. Y.

Orange Sporting Powder.

ORANGE LIGHTNING POWDER,

The *strongest* and *cleanest* Powder made. Nos. 1 to 7, packed *only* in sealed 1 lb. canisters. The coarser sizes (higher numbers) especially are recommended to owners of fine breech-loading guns, giving great penetration with very slight recoil.

ORANGE DUCKING POWDER,

For water fowl. Very strong and clean. Nos. 1 to 5. Packed in metal kegs of 6¼ lbs. each, and in canisters of 1 and 5 lbs.

ORANGE RIFLE POWDER,

The best for rifles and for all ordinary purposes. Sizes F.g, FF.g, FFF.g, the last being the finest. Packed in wood and metal kegs of 25 lbs., 12½ lbs., and 6¼ lbs., and in canisters of 1 lb. and ½ lb.

All of the above give high velocities and less resistance than any other brands made.

BLASTING, MINING, AND SHIPPING POWDER OF ALL GRADES AND SIZES PACKED IN WOOD OR METAL KEGS OF 25 LBS.

SAFETY FUSE AND ELECTRICAL BLASTING APPARATUS.

LAFLIN & RAND POWDER Co.,
21 Park Row, N. Y.

Sole proprietors and manufacturers of the celebrated ORANGE brand of GUNPOWDER. Recommended and used by Capt. A. H. BOGARDUS, the "Champion Wing Shot of the World."

CHALLENGE.
The undersigned is prepared to prove all the superior qualities he claims for his powder.

Safety, Cleanliness, Strength, Little Recoil, Little Smoke, Small Report, Less Heating of the Barrel in Rapid Firing, and its Regularity in Shooting.

He challenges all riflemen to shoot against him with black powder, 200 rounds, without wiping; 100 rounds off-hand, at 200, 500 and 1,000 yards respectively, and 100 rounds in any position at same distances; the 200 rounds equally divided at the three ranges; sighting shots extra.

Will shoot for money if desired.

The powder is also well adapted for shot guns.

Inquire for the "Dittmar Powder" of your dealer, or address the
DITTMAR POWDER MANF'G CO.,
NEPONSET, MASS.

Extra cloth gilt front and back, beveled boards, 412 pp., large 8vo., with numerous excellent maps, plates, and diagrams.

Paper and Metallic Shells
FOR
Breech Loading Shot Guns,
Manufactured by the
UNION METALLIC CARTRIDGE CO.,
BRIDGEPORT, CONN.

THE STURTEVANT SHELLS are the easiest reloaded. Do not have to unscrew the head nor use an awl to remove the exploded caps. THE PATENT MOVABLE ANVILS, made of steel wire, will not bend or break.

THE BERDAN PATENT SHELLS, new model, with Robins' patent waterproof primers, never miss fire, and are highly prized by all that have used them.

PAPER SHELLS.—By repeated experiments and great outlay for improved materials, and machinery made expressly for the purpose, we can now warrant our BROWN PAPER SHELLS equal to any imported. They are sure fire, and will not burst in the gun.

Inquire of any of the dealers in sporting materials for the U. M. C. Co.'s Shells.

Not sold at retail by the manufacturers. dec23 tf

Hart's Sportsman's Favorite Metallic Shells for Breech Loading Shot Guns.

These Shells are easily loaded, and the caps easily extracted from inside. Head solid, and much thicker than any shell now made, giving a solid seat for cone or anvil, which prevents it from driving through or springing away, thereby causing misfires. The cone is made of nickle and fastened solid in its place. It neither rusts or corrodes fast like moveable anvil made of steel. The nickle cone also prevents missfire when cap has been left on shell for a few days, which is liable to occur either in steel or iron. These shells are finely finished, and made any length ordered, from 2½ to 3½ inches.

Shells and Loaders, and description Price Lists, can be obtained from all the leading sportsmen's houses throughout the country. GEO. E. HART & CO., 363 and 365 Market st., Newark, N. J.

From Captain Bogardus, Champion Wing Shot of America.

MESSRS. GEORGE E. HART & CO.,

Gentlemen—The fifty shells I received from you to-day suit me better than any I have ever used. They are stronger and better in every respect, and I shall use them in all my shooting hereafter. Yours truly,
may13-1y A. H. BOGARDUS.

CHAMPION GUNS OF ENGLAND
PAPE'S
Unrivalled Sporting Guns.

Stand unequalled in every contest. Their performance at the London Trials of 1875 beats the records of any maker in the world.

1875. 12-Gauge, Choke Boring.

Maker of Gun.	Exhibitor.
1st—Greener	Greener.
2d—Pape	Davidson.
3d—Pape	Pape.

Out of a class of 68 guns, 3 out of the 6 best were made by Pape. The Greener gun was protested against on the spot for having its score false counted, the fact proven there, and afterwards confirmed by same gun being shot for two days per week for six weeks in succession, when its average score only took 24th place, its very best score being greatly below the scores of the best six guns.

1875. 12-Gauge, Old Sporting Bore.

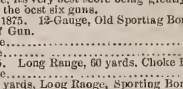
Maker of Gun.	Exhibitor.
1st—Pape	Davidson.
2d—Pape	Davidson.

1875. Long Range, 60 yards, Choke Bores.

1st—Pape	Davidson

60 yards, Long Range, Sporting Boring.

1st—Pape	Davidson



Those champion Long Range guns, only 7 pound weight, with a charge of 3¼ dr. to 1½ oz. shot, beat the best 8 bore Greener gun at 60 yards; weight, 15 lbs.; 6 drachms and 2¼ oz. shot.

1875. The Sportsman's Sub. Cup, valued at £15, was also awarded to W. E. Pape, for the original invention of choke boring. Winner of the London Gun Trials of 1858, 1859, 1866. Address

NORTH OF ENGLAND GUN WORKS,
Newcastle on Tyne, England
dec2 tf NO AGENTS.

H. C. Squires, No. 1, Courtlandt st. New York.

THE GREAT
London Gun Trial,
1875.

W. W. GREENER'S
Far-Killing Prize Guns.

Winner of Silver Cup, value 40 guineas. Winner in Class 1, for 8 and 10 bores. Winner in Class 4, for 20 bores. Winner in the Wear and Tear Trials, July, 1875. 2,500 shots fired without deterioration.

W. W. G. is the only maker who has made an average pattern of 214 shots in a 30-inch circle, at 40 yards, with a 12-bore gun, at any public trial either in England or America.

I have just received a consignment of these guns, and shall offer to individual sportsmen, for a short time, an opportunity to secure one of these celebrated guns at a popular price, viz: $75, gold; extra for extreme close shooting, $10. This will probably be the last chance to secure one of these guns at these very low figures. All grades and styles in stock or imported to order.

Attention is also called to my stock of guns, by W. & C. Scott & Sons, which includes all their latest improvements. No old style guns in stock.

Sole New York Agent for Holabird's Hunting and Fishing Suits. Trade supplied.

214 W. Pratt st., Baltimore.

WILLIAMS & POWELL,
Gun and Rifle Manufacturers,

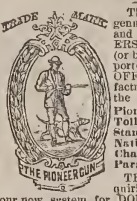
Call the attention of the Sportsmen of America to the extreme SIMPLICITY, STRENTH and DURABILITY of their New Patent "SIMPLEX" Breech loader and INDEPENDENT EXTRACTOR.

The parts in this new action are so few (only two,) its mechanical soundness so thorough, and the strength and simplicity of the action so great, that W. & P. feel sure it will supercede all the complicated and unreliable guns now in use, its one powerful grip being far stronger than any double, treble or quadruple grip now used. In this new action LEVER and GRIP ARE ONE SOLID PIECE OF STEEL and the ANGLE of the BODY is left in its ENTIRE STRENGTH.

Drawings of action and extractor will be sent on application, and orders may be forwarded through any of the best houses in the States for execution in the Spring.

Guns gaaranteed to make patterns of from 160 to 230 with No. 6 SHOT AT 40 YARDS, as desired.

NO. 25 SOUTH CASTLE STREET,
LIVERPOOL.
aug26-tf Established 1780.



For Close, Hard Shooting,

Convenience, Regularity, and absolute Certainty, use KAY'S IMPROVED SHOT CARTRIDGES.

The perfected cartridges for 10 and 12 gauges are now on the market. jy3 1y

NEW YORK, THURSDAY, APRIL 27, 1876.

Volume 6, Number 12. 17 Chatham St. (City Hall Sqr.)

For Forest and Stream.

Off-Hand Jottings in Texas.

EDITOR FOREST AND STREAM:—

ON the great Georgian anniversary I started with my friend L. J. (his headless Irishman), and Mr. J. M., Abe, Tip, Jim, and Corn, two ambulances, my *fides achates* J. D., for Graytown, twenty miles south of here on the San Antonio. We had heard loud talk of the cranes, snipe, and contingent ducks and turkeys there to be seen and, peradventure, to be gathered into our game bags. The preceding day had been warm and of general Sicilian summery look. In the night the venetians of my north window began to bang and rattle. No mistake in the beginning of that. A norther had sprung up. We no longer felt anxious as to how our setters and Zip would stand the heat. Their initials were embraced in two letters—"O. K." As Sol raised his upper eyelid to see how the world was awakening, we sallied out of this ancient city of many days, and were on our way to the happy hunting grounds. I had my little Holland double rifle, and did not lack for targets in the shape of Mexico's national bird (*Aves mexicanus*), of the great Texan hare (*Rabbitus jackrabbitus*), or of that Shaksperean bird, which a knowing Irish prince could sell from a handsaw in certain conditions of the wind. There were prairie owls, à discretion, hawks that seem to have no hindrance in daylight, and which would sometimes rise, a dozen at a time, from the mesquite "perrayrer." I bowled over one of them on the wing with my rifle, as he sailed, as he sailed away, some eighty or ninety yards distant, never dreaming that I had read about Captain Kidd, or that the old New Bond street hunmaker's conical ball would catch up and overhaul him. Should not make B. E. believe (as I believed) that it was a hawk, in billiard parlance. He saw me cut the feathers of a hawk under similar circumstances, and would not be persuaded that it was not purely intentional on my part.

We went before the wind, and being protected by the thick curtain of the "avalanche," as Monroe calls it, did not suffer. How the poor Mexicans (Greasers) we met suffered would be hard to tell. Every beggar of them had his blanket or poncho tightly wrapped about his noble form, Moor in as the lower edge of his nose. Whenever it was possible they had stopped the transportation business, coiled under their wagons, the more quietly and comfortably to shiver, or else had taken out their oxen, built a fire of mesquite wood, and gone regularly into the business of keeping warm. It is comical to see them in our effects whenever what we call a bracing day comes. The candy and cake peddlers crawl into any chance sheltered nook, pull up their blankets, and go into a happy state of speechless misery. Their nature and aspirations differ entirely from ours. When we have that weather which makes us seek the shady side of our streets, they are in their glory; and when we sniff the northern breeze, and holding up our coat-tails towards the pole star, say, "Was there ever such a heavenly climate!" the Greaser's winter of discontent manifests itself in the flesh, as he wonders at the glorious summer behavior of the sun of (New) York. How in his heart he then despises "los Gringos" it is impossible for the pen to describe. They are a peculiar people, those descendants of the Aztecs. As teamsters, concurrent testimony fully establishes their excellence and worthiness of trust; as workmen with tools, tillers of the soil, or in the capacity of servants, they are docile and industrious; as to use thieves, even when a little gentle murder comes in handy, as a help in their game, they are unsurpassed. They subsist on nearly as little as a Digger "Injun" or the Neapolitan Lazzaroni. It frequently occurs to them to eat somebody's cow. With the peculiar curing influence of the air of Texas nothing is easier than to have the meat cured by simply cutting the beef into slips and hanging up anywhere out of reach of carniverous critters. With more of this, some red pepper and onions, or garlic, they seem to be perfectly independent of our Lone Star Delmonicos. An easy and common means of gaining their weekly fifty cents is to go off to the mesquite groves with their wagon and ox team, pay $3 a load for the privilege of cutting, and turn their head cityward. Every night, should there be no rain, they make up a fire, and sleep *a la belle etoile*, turning their hobbled oxen loose to forage for a living. At three or four A. M., they are up and on their way to the market plaza of San Antonio, where the careful citizen buys their load for $3.50. Then the Greaser exults. He has done well and wisely. He is in funds, and like Longfellow's blacksmith "can look the whole world in the face, for he owes not any man"—perhaps! I saw one the other day who had just received his 350 cents. Unfortunately my Spanish has broken loose and got away. I could not catch enough of Castile to soft soap the fellow (much as he needed it) and conversationally worm myself in his confidence. As a rule I believe the Mexicans of low degree cordially hate the American bidalgo. With regard to their morals, I fear it would be crooked truth to say that all their sons are brave, or that any of their daughters are Maria Edgeworths. Next year I hope to converse with the better class in their native lingo. I wish I knew it as well as I know the Teuton tongue. Although I don't speak that "fluidly," I can get along perfectly well in all transactions of business or pleasure.

These paisanos have put me off the track of my shooting narrative—*Revenons a nos moutons!* The country through which we wended our way was picturesque, after the manner of the rolling prairie I have more than once described. We crossed the devious stream on which we live, twenty miles south of the table on which I am now writing. The banks were very precipitous, needing not only strong application of the brake to our wheels, but also that L.'s Irish idiot should take hold of the rear spokes so as to check the (ambulance's) "avalanche's" fall as much as possible. The usual flying ferry-boat landed us at the foot of the other side's steep ascent. Then the only break of which we thought was that which might occur in some part of our harness. Luckily we met with no mishap of that sort, going or coming. Arrived at G—— town, the very obliging tavern-keeper, merchandizer, and postmaster, Herr Schute, not only directed us to the snipe and duck grounds, but took up his Ballard rifle and went with us, as guardian, guide, and friend. We were disappointed as to the game whereof such glowing accounts had been given us. Out of six discovered snipe we bagged five; out of a very fair number of ducks, unapproachable in their behavior, we only secured one, which the German shot, knocking off its head at a hundred yards with his rifle. I shot a blue-winged teal, and L. a mallard. Both fell into the tule grass, working retrievingly in which was impossible to our setters. H. would have been tickled to see the manner in which Jim swam out with L.'s big setter Tobe to the headless duck and took the bird away from the rival retriever; also would his muscles of appreciation have been brought into action had he seen Jim repeat his performance of making a beautiful stand on a fresh partridge as he was bringing me in one I had just killed, in his mouth. We had a hard night of it at Herr Schute's. His pretty little wife did her best to make us comfortable. My bed was composed of some planks, on which a tick with some corn shucks was placed. This was covered with a much-used and most venerable cotton sheet, that by two time-honored blankets of dark complexion, the which had surely given aid and comfort to many a son of the soil. In justice to Mrs. S., I must not omit to state that the lace edging on my pillow-case was at least one inch and a quarter wide. I took off but few clothes, and by using my big ulster, managed to come in contact with but little that was foreign. M. made us up a rousing fire of post oak and mesquite, and Morpheus mildly unanimitted us from misery. In the early morning M. had a cup of coffee that would not be easy to match. It was made from J. D.'s mocha-Java mixture and perfected by a big, rolling, teaspoonful of the condensed eagle milk. This, with fried pig, fried eggs, and a bit of bread set us up for the day. We traveled slowly home, shooting on the way. On turning out our bag after reaching the M—— Hotel, our score was 126 partridges, 5 snipes, 2 doves, 2 chaparral cocks, 3 hares, and 1 duck (gadwall). You must not forget that nearly all our shooting was done before noon of Tuesday and Wednesday.

I regret every day my ignorance of natural history; especially did I regret it yesterday, when I took a very beautiful "paesano," as the Mexicans call the chaparral cock, to be skinned by a Teutonic taxidermist. I mean to have him set up in New York. He is a carnivorous chap, feeding on mice, moles, lizards, and small snakes. He looks somewhat like a pheasant, as he struts proudly along with his handsome crest exalted and thin neck feathers spread out. His color is brownish gray, with shootings of green on the back and wings. Behind the ears are orange colored spots, about the size of a silver franc piece, denuded of feathers. These he conceals with the neighboring plumage, except when in full dress. His tail must be a foot in length, equaling in that dimension the body. In size and weight he is about the equal of a curlew. M. broiled him nicely for our dinner, bringing S. and me to the conviction that we had tasted nothing like its delicious flesh since we came upon the territory of Texas. I ought to tell you that his wings are shortish, and that he rarely flies. If you shouldn't forget it, you may hear more about Senor Paesano from some army officer who has had a hunter's experience down in these parts.

Five P. M., four hours later.—In buying a fresh newspaper yesterday, I asked the clerk if he could refer me to an ornithological account of my above-mentioned bird. He said "No, but I will try to find some one who does know." This P. M. he showed me that the name given by my former informants was pretty surely a corruption of the word "Faisan," which means pheasant. That which I have previously written (paesano) means "peasant"—countryman—and I was told had been given to the bird because he looked as though he were native and to the manor born. Alas! such is tradition! So many respectable and apparently truthful men had told me wrong, that I had quite accepted their rendering of the word. On our way we met many Mexicans traveling on horseback. Very often they had a horse, uncaparisoned, save by a halter; this was being led in order to be used when No. 1 should show signs of fainting by the way. In some cases the led horse was horrible to behold. His back—that part on which the saddle is placed—was one great sore. Mercilessly the unfeeling Greaser mounts him, frequently with a heavy load, when the time to change has come. I passed several steeds so wretchedly emaciated, and so lacerated as to their backs, that I felt like taking up my rifle and ending their miserable career. I am sure that Henry Bergh would have justified me in the act. Now there are no flies. Conceive the torture of said poor beasts in summer when their name is legion.

S. and I have just taken a walk to see our newly acquired territory. How I wish you and D. could have been along. At present there is endless room for the builder, farmer, and landscape gardener, not to speak of him with the vegetable prefix. The acequia or irrigating ditch runs through our northeast corner, and can be readily used whenever needed. I shall have some fencing to do, and have already sent word to Monsieur Lacoste, that pear, plum, and peach trees may be set out. Already we have pecan trees and figs. One of the former measures eight or nine feet in diameter six feet from the ground. Its spread is that of a giant elm. Dr. M., my next door neighbor, has some twenty banana trees, which will bear this year, barring a killing freeze. One side of our place has a fine hedge of osage orange trees. As I came along it a covey of nearly twenty partridges flushed at my feet, and distributed themselves on the grounds. One doesn't have to go very far to find game, you see. Did you ever see the Wallace sisters play? Mr. L. took me to the Casino last night to witness their performance in "Minnie's Luck." From the programme I inclose you can see what sort of a cast it was. The audience was large, select, and enthusiastic. I think I have seen *almost* as good acting at Wallack's in my

younger days. This comprises all the dramatic dissipation I have indulged in since we saw a play together. The "side-splitting" Alf Burnett manifested himself twice at the Alamo Literary Hall, but my sides were aching from a long and hard tramp and didn't need any splitting.

OVERLAND NOTES.

NUMBER SIX.

Continued from April 6th.

THE dawn of a snowy morning had hardly made visible the banks of our narrow ravine before we were in the saddle, making our way to bring in the bison shot the evening before. Our path was the margin of the small stream that had in geological periods worn a cañon through the mountains. A low growth of willows hid the brook, except where frequent beaver dams had flowed a space that, filled with sediment, formed "beaver meadows."

The mountain slope facing north was densely wooded with spruce and balsam, the southern slope, too dry from exposure to sunshine, had but scattered trees; and upon this, where the dry grasses remained, cured into natural hay, we cast our eyes as we went along in file, with the hope of finding mountain sheep. Mr. Link was in advance, with his twelve pound rifle lying over his saddle, senuing with keen eyes the burned spots and fallen timber, when suddenly he sprang from his horse, and, resting his elbow on his knee, aimed carefully but quickly up the rocky cliff and fired. Our dogs rushed up the bank, and in a moment were tussling with a fatally wounded mountain sheep on so steep an incline that all came rolling down, together with dislodged stones and brushwood, an avalanche of snarling, yelping fur and wool. The animal was just passing some large rocks, giving Mr. Link no time to point it out to your correspondent, or even to wait his coming up, and consequently an only fair shot was lost. It was a fine animal—agile, alert, and thoroughly game; more so in all respects than the deer, than which the sheep is the finer trophy. Leaving it in the snow, observing the hunter's custom of laying by it some article that had been worn on the person, to keep off the "varmint" that recognize even by scent the presence of anything indicating man's royal prerogative to his game, we went on in the snow, that grew deep as we gained altitude, until it was up to the stirrups, and our animals could only make progress by putting first one and then another in advance to stand the fatigue of breaking a track. It was rough riding, stumbling over logs, stones, and snow-filled hollows, and an elevation was becoming so great that they breathed with difficulty.

To go light when an ounce becomes a pound, an aneroid barometer was left in camp, but by comparing our height with other formerly ascertained points, we made our final altitude about 11,500 to 12,000 feet, and when the snow squalls drifted away we gained views of wonderful variety and extent through rifts in the clouds, that hid them quickly again with their leaden billows.

Quite exhausted, we came at last where the bison had fallen, and thence following a deep and blood-stained path, where the wounded beast had rolled over the rocks, beating down the deep snow, we found the finest game animal your correspondent ever saw, lying a mass of superb glossy black hair, with his white horns thrown back and his jet black hoofs in the air, prone like a fallen oak.

How great a distinction naturalists make between the buffalo, or bison of the plains, and his kinsman of the mountains, let them explain. Very little anatomical difference will probably be found, but the noble specimen lying before us was far finer in all respects than any from the low land, and well might he be, for his home was in the pure air of the highest mountains, where the sparkling water and fresh verdure of a brief summer, and the keen air of a long winter, would bring to perfection all the qualities of strength, fine coat, and sure footed vigor that is so admired in game. A second one of the herd had been badly wounded, and had we brought up our blankets and provisions we should have followed the trail, now reluctantly abandoned.

The great head, skin, and legs of the bison made a heavy load for one of our horses, a load that would have frightened Tam O'Shanter, or the schoolmaster of Sleepy Hollow, more dreadfully than any they saw had they met it—head, horns, hoofs, and tail on a black horse by moonlight, and the quarters were staggering burdens for our two remaining horses, one of which, as an Irishman would say, was a mule, a wily beast, who, when our eyes were turned, would quietly lie down and roll out from under his load, and then stand looking at it with a look of serene satisfaction that was not disturbed by the liberal amount of kicks and curses that accompanied the laborious work of hoisting the meat up again.

Our camp was well supplied, and wishing to try our disappointed hand again at elk we broke up and went back to Mr. Louis Link's, whence with two horses, our blankets behind us, and our mugs and tea pot rattling to the saddle bows, Mr. Link and your correspondent started after elk, lying under trees, making our tea from melted snow, hoping by going light to overtake a band and win antlers as a trophy.

Before night we found a trail of eight elk, and followed it far enough to form an opinion as to where they were herded. Early the next morning we were up, and welcomed the sunlight as it came gilding the mountain tops. A spotless snow covered all—valley, plain, and mountain top—and eagerly we scanned the wide outlook for game. A sneaking wolf was slowly making his way from one copse to the next, sniffing the air, evidently unsuccessful and hungry after his night's prowl—the only living thing in sight except some gay magpies and camp-haunting meat birds; but as we were watching, a distant roar came faintly on the crisp air, and we recognized the call of the elk, and a response from some listening rival. Quickly, indeed, was our light breakfast made, and we were off. Fortunately there was no fine old china or rarely ugly "majolica" to wash up, nor had we a hotel bill to settle with a leisurely swell clerk. It was only a last pull at the girths and fresh cartridges in our rifles, and we were urging our horses to the point whence came the elk calls. A few miles brought us to the hill, where Mr. Link's long experience told him we were likely to find the game, and here the sign were abundant indeed. The snow was printed with many paths, some with hoof marks as large as those of an ox, but clearly distinguishable by being longer, narrower, and more clearly cut. Carefully choosing the freshest trail, one where there had evidently been a "monarch of the glen," with a royal crown of antlers, we followed it, with our eyes peering into every thicket, and with long pauses upon each knoll that gave us a chance to scan the valleys, and thus, with our rifles ready, we went for many a mile, or, to shorten a long story, for ten hours, only in the end to find that the band had retraced their steps nearly to our starting point and thence gone away, perhaps alarmed by our having been there. Further present pursuit we were unequal to. Our horses were jaded from their long travel through deep snow, and with great regret we made our way homeward, our time not permitting another hunt; but so charmed with the life here, and so impressed with the variety and noble character of the game of the Colorado Parks, that a strong impulse remains to try it again, when more time may admit a long chase.

Going again, we would use pack mules to carry camp necessities, and then, once on the trail of elk, sheep, or bison, keep upon it, camping where night should find us, and thus save the weariness and waste time of going miles back to camp. Thus success in the end would be certain, and delays and difficulties merely the enhancement of the value of the final triumph of a hunter's victory over the keen scent, the alert eyes, the acute hearing, and almost tireless speed of our finest game animals.

L. W. L.

For Forest and Stream.

THE NORTH AND MIDDLE PARKS.

IT has been my fortune to pass several years of my life in the western part of Colorado, in close proximity to the finest game country in America. The section comprising this being known as the Middle and North Parks, lying between two and three hundred miles west of Denver, on the Pacific slope, and abounding in all kinds of game. Large bands of elk, deer (both black and white tail), antelope, and mountain sheep roam undisturbed, save now and then—very rarely, however—by some hunting party of Utes, or by some trappers or venturesome tourists. The latter, however, principally come to fish, and the Eagle and Grand rivers, which abound in the most magnificent specimens of the *Salmo fontinalis*, afford ample opportunities for even the most unskillful, with the rudest of tackles, to thoroughly gratify his desire for trout fishing. To give you an idea of the size of these beauties, I will state that I caught from one hole on the Eagle eighteen, which averaged over a pound apiece.

On my first trip down the Grand, in company with Charley Utter, from Georgetown, the veteran hunter and packer, I well remember his amusement as well as amazement as I unrolled my hook of flies and lines, preparatory to attempting the capture of a few trout for supper.

"Do you think you can ever anchor a five pounder with that rig?" he asked, looking contemptuously at my light bamboo rod and small brown tackle. "Why, he'll string it from here down to the Hot Springs if you try to haul him out with that plaything."

"That's what he will have the opportunity of doing," I remarked, as, stepping forward to the edge of the stream, I spied a place behind a huge boulder, where the water seemed resting after its hard journey, and its surface was smooth and unbroken. "Just the place for one of your five pounders, Charley," I continued, as I cast my fly on the edge of the eddy and sent it skipping across.

I saw the flash of the long body as it darted upward, then a splash, a whizzing of the reel, and away rushed my captive with such force that I had no doubt that I had encountered one of Charley's "big uns." After several minutes' play, I landed him, much to Charley's astonishment and admiration, who affirmed that "he never would have believed it possible if he hadn't seen it done." It weighed over two and three quarter pounds, and was the handsomest fish I had ever seen.

The shooting is confined principally to the wooded slopes and bare tops surrounding the Parks. Here is the home of the noble elk, deer, bear (both black and cinnamon), mountain lion, and on the high tops above timber line, on precipitous and rocky ridges, one finds the mountain sheep, the noblest of game animals, and the one most prized by the sportsman. The California grizzly is not an inhabitant of this country. There is, however, what is called the range grizzly, undoubtedly a cross from the larger species, but never attaining the size of his formidable relative. It is, however, in the vicinity of North Park, which is north and west from Middle Park, that game is found in the greatest abundance. Here, indeed, is the sportsman's elysium. The ordinary tourist never thinks of venturing here. The journey from Middle to North Park is rough; the trail in many places hardly distinguishable. No civilized habitation within a hundred miles.

The best time to hunt is about the middle of October, when the game is generally on the move. Then it seems as if the country was fairly alive with elk and deer journeying south, while the Park itself seems fairly to swarm with antelope. I have frequently heard it asserted by hunters that a few years ago the Utes, during their fall hunt there, killed over five thousand head of antelope. I have no doubt myself but that while I was there I could have killed fifty elk a day by simply sitting down by their trail and shooting them as they passed by, in such great numbers were they.

On the 21st day of October, '73, in company with three others—a packer, guide, and J——, an English gentleman, and a most thorough sportsman—I pitched camp on the edge of one of the heavily timbered gulches in the southeast corner of the Park. After having eaten a lunch, I took my rifle, a Sharps .44 (which, by the way, I consider a perfect sporting rifle), determined to procure some fresh meat for supper. I crossed a low divide, on the other side of which I struck a small stream, and had followed it down for perhaps a half mile, and was standing gazing upon the multiplicity of fresh sign, principally elk, with which the ground was fairly covered, when a cracking among the chaparral bushes at my left caused me to raise my head; there, with head, neck, and shoulders exposed, stood a noble bull elk. His head, surmounted by a pair of magnificent antlers, was thrown back in a most graceful and majestic attitude, while the long dark mane around his neck gave to him an additional air of fierceness and beauty. He was indeed a veritable "monarch of the glen." Scarcely sixty yards distant, broadside on; no wonder I felt the blood rush through my veins as I raised the rifle to my shoulder. Just as the sight darkened back of the fore-shoulder I touched the trigger. The sharp crack of the rifle was followed by a frantic snort, and the old fellow, after making a few desperate leaps, fell dead. But now the bushes seemed fairly alive with elk; out they rushed in all directions; the work was sharp and quick. I soon had four more down, and might have killed the whole band had I so desired for the balance after retreating a short distance, stood like a flock of sheep, utterly confused by the sudden onslaught. At camp I met J——, who had been quite successful, having succeeded, after an hour's hard stalking, in getting on to a band of antelope and killing three of them. I killed that week twenty three elk, only shooting those with fine heads, however, although I had vowed after the first day not to shoot another one until we needed it; but the temptation was too great for me when an unusually fine head loomed up before me, and I constantly found myself giving away. We also had a great deal of sport running antelope with dogs. We would start a pair of fox-hounds on the trail, and then seeking some cover near where we thought the hounds would bring them, would take our position with a pair of beautiful greyhounds. The dogs would invariably bring them around. It was an exciting moment as a band of these graceful animals bore down upon us, their white bellies flashing in the sun as they followed some quick turn of their leader. Now they stop and gaze back at their pursuers, but the deep angry bay soon decides them, and they turn and dash on with renewed speed. Now the greyhounds spy them. See how their eyes flash and sparkle as, trembling with eagerness and excitement, they draw their long, sinewy bodies close to the ground, waiting for the decisive moment. Now, I say to J——. It is the work of a moment to slip them, and the noble fellows bound forward and bear down on the affrighted band with the speed of the wind. Now the antelope, conscious of their danger, strain every nerve to escape their swift pursuers. Away they go, pursuer and pursued, fairly flying over the smooth Park. "Ay! that's glorious!" shouts J——, his cheek flushing and eye sparkling with excitement. Nearer and nearer the dogs draw on to the antelope. Soon they seize one, a great cloud of dust arises, and running up we find them panting over their prostrate victim. It was indeed glorious sport, well worth the hardships experienced in getting there.

Since then a wagon road has been constructed from Georgetown to Middle Park, by way of Berthoud Pass, opening that country to the public, and consequently forcing the game back. It has also opened a path to the market hunter, and immense quantities of game are shipped to Georgetown and Denver. Not the slightest attention is given to the game laws, the people seeming to labor under the idea that it is impossible to drive the game away. Last winter, in the Middle Park, men were even shooting elk solely for their hides. To my mind, extermination is the work only of a few years; and what was a short time ago the finest game country in America will soon be entirely deserted by those noble animals that have for centuries roamed there rarely disturbed.

"SANCHO."

For Forest and Stream.

STILL HUNTING ON MT. VANDERWACKER.

Editor Forest and Stream.—I have received from Charles Fenton, Esq., of Adirondack fame, the following incidents of a hunt which took place in 1857. It may prove interesting to your numerous readers. Yours truly,

FRANK BOLLES, JR., Windsor, Ct.

AFTER five days' bouncing over the Catamount, or Carthage and Lake Champlain Road, in a wagon containing our supplies for a two months' hunt, we reached the little settlement of Pendleton, where four or five families lived. The road had been given up as impassable several years before, and we asked a grave looking man what the chances were of getting over it. He shook his head doubtfully. Then we turned to our teamster. "Well," said he, "I hev driv this old team for twelve years in the woods, and I hev never seen that place so bad that I couldn't git through some way." And so we moved on. That our faith in his assurance was well founded, the sequel showed. The road getting from bad to worse, we came at last to a stand, where the corduroy was all broken up, and the mud holes unfathomable. Our party were some distance ahead, walking; and wishing to see what our teamster would do under the circumstances, we secreted ourselves behind some trees and watched. Well, as soon as he came to the place he rose up in his wagon, scanned the ruins of the old corduroy for a moment, then glancing his eye up the road to see if we were in sight, settled back in his seat, took a firm grip on the reins, and plunged in. Down, down, went the horses into the mud among the broken logs, the driver swinging his whip lustily and loudly urging on his horses. But it was no use; they floundered along until they got to about the centre of the mud hole, when one of them became entangled and fell upon his side. A few ineffectual struggles to rise only brought him deeper in the mire. Our driver was not discouraged by any means at this. He dismounted from his wagon and patted his horse on the head, telling him to keep quiet a little while, and he would help him. He then coolly sat down on a log, drew forth his pipe, charged it, and commenced puffing away as if nothing had happened. After awhile he took his ax, cut a lever, adjusted a fulcrum, run his lever under the horse, and commenced prying him up. At this turn of affairs we could hold in no longer, but revealed our hiding place by uproarious laughter. So we came to the rescue. A short time sufficed to extricate the horses, and we went on our way rejoicing.

Our camp was located at the base of Mt. Vanderwacker, one of the most imposing of the Adirondack mountains. I have looked on the Wilderness Map, but fail to find any mountain by this name. Probably the name has been changed. Do you know? It stands isolated from the surrounding mountains, and has a base of fifteen miles in circumference; its southern base is washed by the Hudson River, which was five miles from us. The first two days we spent about camp, making general repairs throughout, cutting wood, etc. On the third day I succeeded in securing a fine doe, but my two companions, who went in an other direction, got lost in an immense windfall, and spent most of the day trying to find their way out. So they brought in nothing. The next day, the weather shifting cold, froze the damp leaves so that there was no more hunting, as deer could hear us approaching much farther than we could see them in the thick woods. At last, after several days, came a light fall of snow one night, just enough to cover the ground, but not enough to make good tracking. However, as soon as it was light enough to see to

travel we struck out, each taking a different direction. My course lay up the mountain, I had not advanced far up before I came upon the tracks of two deer, a doe and a buck, and at once started in pursuit. It was very noisy under foot, and it required the utmost strategy to get a shot. But fortune favored me for they ascended the mountain until they passed the belt of deciduous trees, with which the mountain is girted to a certain height, and entered the thick evergreens. Here the ground was covered with soft moss, and I could walk much more quietly. Besides, moss furnishes excellent food for deer, and the marks indicated that they were feeding, and probably not far distant. I now advanced with the greatest caution and stealth, carefully scanning the ground foot by foot, before me. It was perfectly still. The trees were as motionless as the mountain on which they grew; profoundest silence every-where. I listen for some slightest sound; some cracking of brush or foot steps, that may indicate their whereabouts; but I hear only the pulsations of my own heart as it throbs with anxious expectation. Yet, another step, and there is the doe lying down behind an old fallen tree! I can see only about two inches of her head above the log. It is a poor shot but I must try it. So my rifle cracks, and all the echoes of the crisp morning air awake! Her head is lost to view, but in an instant the old buck reveals himself, rising from his bed, and making a few bounds toward me. When he reached the doe he stopped, turned around, and looked at her in utter amazement. The occurrence was doubtless beyond his comprehension. I brought the other barrel of my rifle to bear upon him and fired. He rushed madly down the mountain a few rods and fell dead. After him I went, and drawing him back to the doe I hung them both on one pole, and went in pursuit of more. I soon found an old buck's track, but he appeared to be on the travel, as he made no stop, but went in a zigzag course up the mountain. Higher and still higher he ascends, the air getting fearfully cold. The clouds sweep past me, shrouding me in a dense mist; but his course is still upward until we near the summit. Then from a pinnacle I gaze down upon a scene I can never forget, much less describe; words are inadequate. I am above the clouds and shut out from the earth beneath, but all around are mountain tops, glittering in the setting sun, which seem to rise out of an ocean of vapor, like islands from the bosom of the sea. For awhile I stood enchanted; then a feeling of loneliness stole over me. I awoke from my reverie and pushed on after the old buck. I soon got discouraged, however, as he made no stops, and I was perhaps no nearer than when I commenced following him; besides, it was near sundown, and I was three or four miles away from camp, and must start at once to reach it before dark.

I stood taking my reckoning from the compass, to see in what direction to travel, when suddenly I heard a great rustling among the evergreens just over a little elevation of ground. Supposing that I had at last routed the buck from his lair, I rushed to gain the elevation, and perchance get a running shot; but what was my surprise, on looking over the brow of the hill, to see not the old buck, but four bears, an old one and three cubs. They seemed to be going through a regular course of gymnastics, as they were playing all sorts of antics. Soon one of the cubs jumped upon a log, presenting an opportunity for a shot which I quickly improved. At the crack of my rifle he pitched off and rolled down the mountain like a hoop, doubled up and turning over and over. This at once put a stop to all bear play. They hustled about in great excitement, not knowing what direction to take to avoid this intrusion into their family sports. Soon they started off at a right angle to the course of the cub I had shot. The evergreens were very thick, and their motions were so active that it was impossible to discharge my remaining barrel with any degree of certainty; so I made a sharp noise to attract their attention, and the old bear suddenly stopped. I could only see her hind parts, but it was my only chance; I fired instantly, and they all disappeared. I first followed the cub I had shot, and found him dead about a hundred yards from where I shot him. I then took after the last one I had shot at, and soon discovered by the blood on the snow that she was wounded. The cubs soon left their dam, whether from instinct or by her dictation I cannot say. I pursued her nearly half a mile, when I saw her rise up from a pool of water and make off. I took a running shot, but without effect. Another quarter of a mile, and I saw her rise up not more than ten yards away and beat a rapid retreat. I sent a bullet flying after her, which struck her, but not in a vital part, though it crippled her somewhat, and she made for the thick scrub evergreen. Near the summit of this mountain is a thick growth of stunted evergreens, chiefly spruce, from five to ten feet high, the limbs growing close to the ground. You cannot see an object more than ten feet distant as a general thing, and even then one must creep on all fours in order to get through and see anything. They grow in clumps, with intervening clearer spaces, where there is not much timber. The wounded bear plunged into one of these hedges, if not more than three rods in diameter. I followed around the open space that enclosed it, but saw she had not come out. When I came around to her tracks again I thrust myself into the bushes, which routed her; then she made for a more extensive jungle. It was now so dark that I could not see the sights on my rifle, and it was with the greatest difficulty that I could follow her. I would have left her till the following day, but there was so little snow that should it snow ever so little, or even thaw the least, it would obliterate the track, and I would lose her. I therefore resolved to pursue as long as I could see her tracks. So on my hands and knees I entered the thicket in pursuit; my hat was soon torn from my head by the thick bush, but I deemed it useless to replace, so I left it dangling in the branches and went on hatless. But hat or hair was of little importance to me now; it was the bear I wanted. She would go but a short distance and then lie down; then I would come up to her. It was so dark by this time I could only discern a dark object ten or fifteen feet distant; but getting as good a range as I could along the barrels of my rifle I would fire. A most fearful growling gnashing of teeth, would greet the discharge, but in the thick smoke and darkness I could scarcely see anything. I had a large knife hung by my side, and as soon as I fired I would place my hand on the handle, expecting to come to a hand to paw fight; but although she tore by me snarling most fearfully, and so near that I could almost feel her hot breath on my face, she refused to commence the attack. I fired four shots at her in this way in the thicket of spruces, and then drove her to more open ground, where I was able to obtain a better shot, whereupon she rolled over on her back and pawed the air as if inviting me to a hug. I supposed it was her dying struggle, and I went and stood by her side, when she suddenly rolled to her feet again and ran down the mountain faster than ever, and I had to follow some distance before I overtook her again. She again lay down, and I fired both barrels, which took effect, and she rolled over on her side with a groan. I rushed upon her and plunged my knife into her breast and she gave in. I gave one exultant shout and then turned my attention to getting to camp.

It was now total darkness, and I was near the summit of one of the highest of the Adirondack mountains. There was a road running along the base, made by lumbermen, and used in the winter. This road passed our camp, and I had only to gain this when I could easily find the shanty. I at once commenced the descent, but made slow progress, as there were many perpendicular ledges of rock, and I was obliged to feel my way down, banging on to the trunks of trees, and often sliding down on my back for many feet, bringing up against tree trunks and rocks. Although it was but two or three miles down to the road, it appeared at least ten. However, I at length reached the road and camp in safety, to the no small joy of my companions, as well as of myself. They had given me up as lost, and were planning a search for me in the morning. That night, as we sat around the blazing camp fire, I recited to them the exciting adventures of my day's hunt on Mt. Vandewacker.

Fish Culture.

THE NATURAL AND ECONOMIC HISTORY OF THE SALMONIDÆ—GEOGRAPHICAL DISTRIBUTION AND ARTIFICIAL CULTURE.

NO. NINE.

BY PHILO ICHTHYOS.

THE experiments of M. Vraski in artificial fecundation would seem to establish the fact that much more milt is used than is necessary. It is quite probable that a more careful study of embryology will establish the subtile properties of the spermatozoids, that they have such inherent power, and affinity for the ova that the inception of the minutest of these life-giving atoms into the egg is all-sufficient for its perfect vitalization. Mr. Thaddeus Norris makes pertinent mention in his "American Fish Culture" (page 54), of an experiment, in which Mr. Stephen Ainsworth, one of the pioneer fish culturists of our country, fertilized as many eggs as would cover the bottom of his pan with a single drop of milt. Spallanzani, the celebrated Italian embryologist and naturalist, records a similar instance of ova being vitalized with an infinitesimal quantity of male sperm. We need no better evidence than we can glean from the natural method of fecundation upon the spawning bed in the native streams where fishes breed that a minute quantity only is needed. It will also illustrate a fact that the endowment of the male of a superabundance of sperm is necessary when used upon the spawning beds, for more is borne away by the current than is lodged upon the ova, and the utilized portion must descend upon the eggs in a greatly diluted condition. Instances occur when the milt of the male is entirely devoid of vitalizing properties, barren, so to speak, and it can only be distinguished from that of the prolific males by the aid of a microscope, which develops an absence of active spermatozoa. It often happens that whole broods thus escape fecundation, which can only be positively ascertained after the eggs have been ten days upon the hatching boxes, the lack of vitality being known by the absconce of the volatile movement of globules. Before leaving this question, it is well to advise the use of the milt to the extent of rendering the water opalescent, or of a pearly hue, until experiments determine how much or how little is necessary for the establishment of vitality. We know, by experiments, that a drop of sperm in a half pint of water exhibits countless spermatozoids, when a single drop of the dilution is put between two pieces of plate-glass and placed under a microscope of high power. These vital atoms may be seen moving rapidly in every direction, evincing of themselves an inherent power to the extent that only a small particle is requisite to impart life to the embryo. After the eggs are permitted to absorb a sufficient quantity of the spermatozoids, more or less, during the process of absorption the water in the pan should be kept at an equable temperature, probably at 50°. No very great haste should be manifested in moving the eggs from the pan to the hatching troughs or trays. The process of impregnation is but a brief one, whether the wet or dry method is used. Embryologists, however, aver that the eggs are very easily injured if moved too soon. Therefore, when the temperature of the water in which they are still left can be easily maintained, a half hour or more of rest should be allowed the eggs before spreading them in the trays for incubation. After ample time has been given, and after thorough rinsing of the eggs they may be put into the trays. The washing is not absolutely necessary for the health of the spawn, but is resorted to more particularly for the reason that the opacity imparted by the milt is removed that the operator may see his way more clearly. The eggs should be so placed upon the grills of the trays that they do not lie one upon another. Great care must be manifested at first in handling the embryos, for any jar or knock will destroy them, while the initial vital processes are being exerted, which, in time, if care is taken, results in the development of the living fish. When the work of development progresses a little farther these germs of future fishes may be moved with impunity, even committed to the tender mercies (?) of an expressman for the purpose of journeying across the continent, or around the world. When the eggs are laid down for hatching upon their natal beds, no disturbing noises, jars, pounding, or hammering should be allowed within the hatching-house, for the concussion during the first stages of incubation will, no doubt, result in the destruction of large numbers of the ova. Upon their natural spawning grounds there is no noise, jarring or commotion, only the gentle and ceaseless rhythm of the waters is murmured, as the lullaby song of nature that attends upon their protracted transformation, and ushers the tiny being into life. It is a singular yet a persistent feature of ova life that cannot be ignored, that they will not bear transportation at a very early period after impregnation; a small percentage only will survive even a short journey at ten days after fecundation. We have, we trust, made this portion of our subject so plain that any intelligent person may fully comprehend it, and be able, with care, to practice all of the details of artificial fecundation. We will suppose that sufficient spawn has been procured to fill the hatching apparatus of the ample hatching house long since delineated and described. Not only did we provide an abundance of trays and troughs, but a supply of pure cold water sufficient for every emergency, to be had simply by turning a stop cock at the head of the hatchery, where the water had been subjected to repeated straining ere it could flow over the many thousands of ova placed in trays for incubation. The responsibility of the fish farmer really begins when the eggs are put down for hatching. Be a prudent man now, and do not "count your chickens before they are hatched." Fish farming has its besetments and drawbacks, and they really begin with the first practical business connected with the art. Every occupation has its peculiar embarrassments, and those men who meet these expected difficulties with manliness, skill, and perseverance, with such measures and appliances as are calculated to overcome them most speedily are the men who grow strong and efficient in their chosen pursuits, and succeed. In fish culture the truth of that old adage is strikingly exemplified daily. "A stitch in time saves nine." In the first place, the hatching boxes, as has already been hinted, should be covered with wire screens, or thick board covers, to keep out rats and mice, for they are especially fond of spawn, and are the bane of the fish farmer. Poison, judiciously managed, will soon rid the establishment of these marauders. Sunlight should be excluded from the building, or toned down to twilight. A small bull's-eye lantern, or one furnished with a suitable reflector, will greatly aid in the constant labor required in connection with hatching. *Dead spawn* soon show themselves, and the practiced eye will soon detect them from their peculiar *dead white* contrasted with the pearly *living white* of the healthy eggs. Remove them at once.

It is quite difficult to remove eggs with the fingers, as they are slippery and elude the grasp; hence numerous instruments have been devised for their removal. The best instrument in use is a wooden forcep or pincer, which can be easily shaped by an ingenious whittler, and it is so light that the fingers will not tire in using it. The mandibles have each small cavities, and this simple instrument is really a valuable acquisition for this business. Some fish culturists have pincers with pointed blades, pipetts and spoon-shaped scoops, the latter to be placed under the egg, which is to be thrown out with a dexterous turn of the wrist. These last mentioned instruments are clumsy, even if compared with the wooden forcep. Dr. Slack invented the bulb syringe, which has been adopted by many of our fish culturists, and he claimed for it that it is the most perfect instrument in use. He avers that 150 dead spawn were removed from a tray in one minute with one of these instruments. In the meantime the eggs should be carefully turned by means of a feather, so that the current of water may act upon the whole surface of the ova, and in carefully turning them from time to time, the *byssus*, or fungoid disease, may be more readily discovered—the bane and terror of all pisciculturists, a devastating blight, a pestilence so stubborn and defiant that it often attacks and destroys whole crops of eggs, and worst of all, there is no balm in Gilead, no physician there that can stay its march, unless the bold procedure of washing off the fungus with sand and water, as resorted to by Mr. John G. Woodbury, an assistant of Mr. Livingston Stone's at the United States establishment on the McCloud River, Cal. His method was to put a few hundred diseased eggs in a pail partly filled with water, in which was dropped a handful of fine river sand. Upon holding the pail containing the eggs and sand under a stream of water, the whirling sand being brought into contact with the whirling eggs, so constantly and rapidly, and yet so gently, that in a few minutes the fungus was entirely removed and cleansed from the eggs, while the eggs were not in the least injured. It is a tedious process, and would be a herculean task to treat several hundred thousand eggs in this manner; but the expedient will pay, rather than abandon the whole crop to the ravages and certain death, which would speedily ensue from the inexorable fungus. This vegetative growth is of a filamentous character, and gives the eggs attacked the appearance of minute balls of cotton. If the first infested egg is not removed, it will soon be communicated to others, and at once a focus of contagion is established, from which it spreads, as from a common centre, until all are involved in the common ruin. The dead eggs should be daily removed, then no nucleus of contagion can form.

The study of embryology, so conspicuously a part of fish culture, is a subject of more than usual interest to a person having an investigating turn of mind. If the mysterious processes incident to embryo life were more critically studied from the first day of incubation until the emergence of the fish, many valuable discoveries might yet be made of great consequence to the fish farmer. The expression of Aristotle—*omne vivum ex ovo*—was crowned long ago by the lamented Agassiz with new and fresh laurels, that will tend to preserve the adage as one of the truest utterances since the advent of the race. If we examine the egg when first placed in the tray, under a microscope of average power, it will be found to be filled with a gelatinous substance very nearly corresponding to the albumen of other eggs, on which float infinitesimal granules and oil globules. So versatile are these minute elements, that if we turn the eggs in any direction they quickly and invariably rise to the top. On the second day a separation may be seen to have taken place between the yolk and albumen, when the granules and globules will be found to have aggregated themselves into a minute drop or vesicle in the centre of the egg surrounded by a transparent zone in which it floats. This is the first indication of a *germ* whose composition is of very delicate cells, and is the *primum*

mobile, or first impulse of life in a tangible form, from which cell growth proceeds, as from a focal point. This phenomenon takes place about the fifth day, and the germ continues to extend by cell growth, until it forms an envelope around the yolk, which it at length entirely infolds. About the eighteenth day the enveloping growth has extended around one-half of the yolk, and the pointed end of the increasing substance is the embryo tail, while the other thickened and flattened end is the rudimentary head. On the twentieth day the eyes are outlined, and from this time onward the growth is rapid indeed. If the water is kept at a temperature of 50°, eggs hatch in fifty days; the period of incubation, however, is lengthened by a lower, and shortened by a higher temperature of the water. At the salmon ponds of Stormontfield, where the streams are icy cold, eggs laid down hatch in from 128 to 130 days. There is usually a difference of 50 days between those deposited in September and those spawned in December. At Huningue, France, salmon eggs have been hatched in sixty days, while the shortest period of incubation at Stormontfield is 120 days. A short time before the fish burst from the shell the investing membrane of the egg becomes of a dirty, yellowish color, and a filamentous or floss-like coating surrounds it, reminding the practiced eye of the fatal fungoid disease. The feeble movements of the fish, which have been apparent since the thirtieth day, now assume the form of convulsive action, which continues with more or less violence until the shell is broken and the tiny thing is born.

Some of the earlier writers on fish culture advise aiding the struggling fish in its efforts to merge from the already fractured shell, by gently passing over the body of the fish a delicate camel's hair brush. Nature is usually adequate in all such emergencies, while officious and meddlesome midwifery is usually attended with baneful results. Healthy fishes will easily place themselves outside of their long environment; but if they are sickly and feeble, this supreme effort usually ends in death, sooner or later. The expectant crop now having been liberated, and the new life begun, if the hatching has been conducted in gravel troughs, they should now thoroughly be cleansed from shells, or any *debris* which, by decomposition, may interfere with the health of the fish. If the Caron or Caste trays have been used, all such remains have been carried away by the water between the interstices of the grille, and the young fish also find a passage through to the tray beneath, from which they may be drawn off, by removing the cork into a pan; but as they are heavily encumbered with the yolk-sac, their removal should be conducted with gentleness and care. What dirt or egg shells may have followed the fish must be carefully floated off, or removed by nippers, or a bulb-syringe. If nursery troughs have not been arranged for the reception of the hatchlings, they may occupy the trays for a brief period, until complete arrangements may be perfected. In this case the grille is removed from each tray, the box thoroughly cleansed, and the bottom covered with fine gravel, which must not only be washed, but thoroughly boiled, that all of the larvæ of insects may be destroyed. Upon this clean gravel the fish are placed, and a gentle current of water allowed to glide gently over them. If nursery troughs have been provided, the wood should be thoroughly steamed or scalded, that all fungi or insects may be destroyed, while the gravel should be treated in like manner, for like reasons. The nursery troughs may be 20 or 30 feet long, 18 inches wide, and 3 inches deep. The troughs may be divided into as many compartments as they are feet long, by screens of fine copper wire, gauze, or iron coated with some pigment not made of lead, each division being sufficient for the accommodation of 1,000 or 1,200 fishes. The water supply must be carefully regulated; if the current is too strong, the fish will be too violently driven against the screens, and destroyed. In the regulation of the amount and force of the water, experience is the only safe and reliable guide, as in all the other delicate manipulations which are necessarily connected with fish culture.

DOMINION FISHERY REPORT.—The Report of the Canadian Fishery Commissioners has been before us for two weeks, but we are obliged to defer an abstract for one week more. We are indebted to Com. W. F. Whitcher and to two other parties for copies, an attention that we appreciate. There is no public document printed that shows greater care and accuracy in its preparation, or is more valuable or comprehensive in the statistics which it presents.

BLACK BASS IN WINTER.

PHILADELPHIA, Pa., April 17th, 1876.

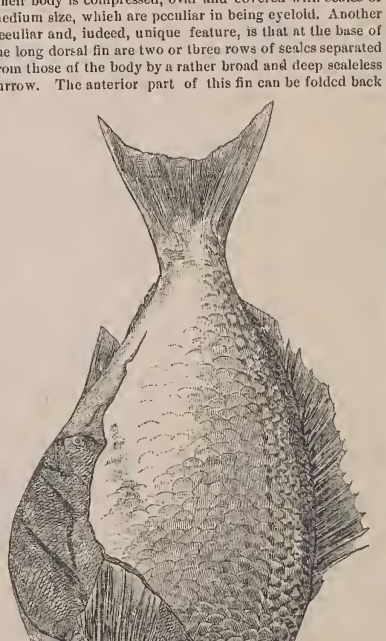
EDITOR FOREST AND STREAM:—

In your issue of March 30th Mr. Thomas S. Roberts, writing from Minneapolis, Minn., refers to the article on the bass, written by me, wherein I said: "They are a summer fish, and it is doubtful if they feed at all in winter; they probably hibernate." I wrote this from only limited observations of this fish in Western New York. I kept one nearly all winter in an aquarium, and it did not eat, and seldom moved anything except its eyes. I have also tried to catch them from the small but well-stocked pond of Hon. S. H. Ainsworth, at West Bloomfield, without success. I have, however, seen those that were taken with a hook in Northern Michigan, in March, while it is still winter in that locality, and Mr. Roberts' experience would seem to show that they take the hook at that time in his vicinity.

After reading his article I wrote to Mr. A. W. Latham, Commissioner of Fisheries for Minn., residing at Excelsior, in regard to the matter, and he replies: "I believe that you are in the main correct. They spawn here during the month of May, and are plentiful during the summer and fall months. Occasionally they are caught through the ice, both with the hook and spear, but are comparatively scarce during the winter. They then lie low in deep water, and seem, after a fashion, to hibernate." It would be interesting to get the facts from many localities, and see if their habit varies in different places.

FRED MATHER.

RAVAGES BY THE POTATO BUG.—It is said that the potato bugs on Long Island are very numerous, and have already made sad havoc with the early crops. Mr. Jacob Schoemaker, a farmer at Flatbush, has had about $2,000 worth of early sprouts destroyed, and the farmers in that section, in plowing up their grounds, discovered bushels of the bugs.



—The St. Augustine (Florida) hotels will close about May 1st, with the exception of the Marion, which will remain open during May and June.

Natural History.

[This Department is under the charge of a competent Naturalist, indorsed by the Smithsonian Institution, and will henceforth be made a special feature of this paper. All communications, notes, queries, remarks, and seasonal observations will receive careful attention.]

A VIVIPAROUS PERCH.

WE present to-day an engraving of the viviparous perch of the Pacific coast, belonging to the *Embiotocoidæ* of Agassiz, concerning which we printed a letter from Dr. Yarrow in our issue of April 6. This wood-cut is from a photograph taken many years ago in San Francisco, where the young used to be served up as a delicacy. Professor Agassiz was much interested in these fishes, and wrote an article about them in the *American Journal of Science and Art* for November, 1853. He described two species—*Embiotoca Jacksoni* and *E. Caryi*—the latter after Thos. G. Cary, of Boston, who procured for him the specimens, and who has now kindly furnished us the photograph we have copied, and written us a letter upon the subject. The general appearance of the fishes of this family is that of our larger *Pomotis*. They are from 8 to 11 inches in length. Their body is compressed, oval and covered with scales of medium size, which are peculiar in being eyelold. Another peculiar and, indeed, unique feature, is that at the base of the long dorsal fin are two or three rows of scales separated from those of the body by a rather broad and deep scaleless furrow. The anterior part of this fin can be folded back

and concealed. The female genital apparatus in a state of pregnancy consists of a large violet bag, so transparent that one can distinguish through it the shape, color and formation of the small fish with which it is filled. The fish when ready to escape are miniatures of their mother in shape and color, and fitted to seek their own livelihood. This genital sack seems to be nothing but the widened lower end of the ovary, and the pouches into which it is divided within are merely folds of the ovary itself. In each of these pouches a young one is wrapped up as in a sheet, and all are packed in tightly. It is, therefore, a normal ovarian gestation. The external genital opening is situated behind the anus. As many as 19 young have been found in one fish. The males are not quite as large as the females, either in length or circumference. Mr. Cary writes that there is a great variety of these fishes, differing much in size and color.

When scientific attention was first attracted to them, four and twenty years ago, it was generally supposed that the discovery was a new one, but that was a mistake. In 1769 a transit of Venus was to take place on the 3d of the June. The event was of such importance that an expedition was sent from Paris to observe the transit at Cape St. Lucas, at the extreme southern end of Lower California. After the astronomical observations were finished the party went up the coast some distance. On their return to Paris, the naturalist of the expedition reported that on the coast of California were found sea perch which had their young alive, and when the small fish were squeezed out of the parent they would swim with great celerity. It is to be hoped that pains may be taken to arrive at a complete knowledge of the natural history of these viviparous perches; and especially that the embryology and the early stages of growth in the young may be investigated.

BIRDS OF CENTRAL NEW YORK.

The following is a partial list of the birds of Central New York, the area covered by the observations comprising the counties of Cayuga, Seneca, and Wayne. I expect to be able to add to its numbers and information during the present and following seasons:—

FAMILY TURDIDÆ.

Turdus migratorius. Robin. Abundant from April to November; only a few remain all winter.

Turdus mustelinus. Wood thrush. Arrives the last week in April. It is not a very common summer resident, and departs the first week in October.

Turdus Swainsoni. Olive-backed thrush. Arrives the second week in May, and remains a few days, after which all pass north to breed. It returns the last in September.

Turdus fuscescens. Wilson's thrush. Arrives the first week in May, and remains through the summer, but is not very common. It moves southward the first week of September.

Mimus carolinensis. Cat-bird. Abundant from the last week in May to the first week in October.

Harporhynchus rufus. Brown thrush. An irregular summer visitor, tolerably common some seasons, and not to be found others.

FAMILY SAXICOLIDÆ.

Sialia sialis. Blue-bird. After the first week in March it is abundant until November.

FAMILY SYLVIIDÆ.

Regulus calendula. Ruby-crowned kinglet. It arrives the last week in April, passes north to breed, and returns early in October.

Regulus satrapa. Golden-crested kinglet. Appears the second week in April, moving northward, whence it returns in October.

FAMILY PARIDÆ.

Parus atricapillus. Chickadee. Resident, breeding abundantly.

FAMILY SITTIDÆ.

Sitta carolinensis. White-bellied nuthatch. Resident, and abundant; breeds.

Sitta canadensis. Red-bellied nuthatch. Arrives about April 1st, and soon passes north, returning in October, and going south for the winter.

FAMILY CERTHIIDÆ.

Certhia familiaris. Brown creeper. Resident, but especially abundant in the breeding season.

FAMILY TROGLODYTIDÆ.

Troglodytes ædon. House wren. Arrives in May; is not very common during the summer, when it breeds, and departs southward in October.

Telmatodytes palustris. Long-billed marsh wren. Summer resident; breeds.

Cistothorus stellaris. Short billed marsh wren. Summer resident; breeds. HARRY W. CANDEE.

To be continued.

NOTES FROM OUR CORRESPONDENTS.—"Teal" (Salem, Mass., April 6th), says:—Woodcocks are numerous, some black ducks are about, and bay ducks are numerous. I have noticed the brown thrasher, snow-bird, chipping, song and fox sparrows; purple finch; purple and rusty grakles, and red-winged black-bird; fish and pigeon hawks, and a single unknown swallow. The last is unusual so early. Quails are doing well, but not a snipe has been heard yet....Chas. O. Gladwin (Higganum, Conn.) reports the first robins seen on March 17th, and red-headed woodpeckers on March 20th. April 6th and 7th many wild geese were flying northward, the wind being moderate. April 8th vegetation was starting, and the traveling arbutus was almost open....Mr. Thomas Bland informs us that Prof. Linden lately found on Gonave Island, N. J., hermit crabs inhabiting a land shell, and "moving briskly about in an old pasture at a distance of two miles from the nearest sea beach," This is surprising....C. Jeff Clark killed an albino robin a few miles out of St. Louis, Mo., on April 8th. The breast of the bird was the regulation red, and all the rest of the plumage was snowy white. Mr Clark also has a perfectly white live mocking-bird....A Lawrence County (Ohio) boy set a trap for crows. The morning after the trap was gone. About six weeks afterward a large owl attacking the chickens was killed, and attached firmly to his foot was the missing steel trap which weighed over a pound....Dr. C. C. Abbott promises to be our frog, turtle, and snake reporter during the coming season....S. M. Dunbar (Baltwinsville, N. Y.) writes us that he has secured an albino robin...."Wood Duck" (Englewood, N. J.) describes an albino sora rail which he shot on the Hackensack marshes last September. It had a white spot on its back the size of a silver dollar, and more white than is usual on the sides.

EUROPEAN WOODCOCK SHOT IN VIRGINIA—Ornithologists will be interested to learn that a specimen of the European woodcock (*Scolopax rusticola*) was shot in 1873, in Londoun County, Va., by a brother of Dr. M. G. Ellzey. All the particulars of the occurrence have been detailed to me by this gentleman, and there is no reason to admit a doubt in the case. This is the only instance of which I have become aware of the presence of this European straggler in the United States south of New Jersey.

ELLIOTT COUES, U. S. A.

A REPORT FROM NEW HAMPSHIRE.

FARMINGTON, N. H., April 17th.

EDITOR FOREST AND STREAM:—

The first appearance of birds in this region we have noted are as follows: April 4th, robins; April 8th, phœbe bird and an unknown hawk; April 9th, song-sparrow; April 11th, red-winged blackbird, and blue-bird; April 12, white-breasted (bellied) swallow; April 13th, red-tailed hawk; April 16th, chipping sparrow. The gap between the 4th and 8th was caused by a furious snow-storm, which must have driven the birds back south. Up to the 12th, the date of the arrival of each species differed very little from that of last season. Since then, the weather having become somewhat cooler, the migration seems to have stopped, as no new varieties can be found. S. S. PARKER.

RESIDENT BIRDS OF DANVERS, MASS.

DANVERSPORT, Mass., March 6th, 1876.

EDITOR FOREST AND STREAM:—

I send you a list of our resident birds. I am glad that you have called for facts regarding our ornithology, etc., and I shall furnish any items coming under my observation which I deem of interest to the readers of your paper. The following birds remain in the vicinity of Danvers, Essex County, Mass., throughout the year:—

Robin. Abundant in summer, and a few remain in winter.
Chick-a-dee. Scarce in summer; common in winter.
Brown creeper. Scarce in summer; common in winter.
Cedar-bird. Common in summer; rather common in winter.
Purple finch. Common in summer; rare in winter.
American goldfinch. Common in summer; a few in winter.
Song-sparrow. Common in summer; a few in winter.
English sparrow. Common in most villages.
Meadow lark. Common in summer; rare in winter.
Crow. Abundant at all times.
Blue jay. Common at all times.
Belted kingfisher. Common in summer; rare in winter.
Hairy woodpecker. Never common.
Downy woodpecker. Common at all times.
Golden-winged woodpecker. Common in summer; and not uncommon in winter.
Great horned owl. Rather rare at all times.
Mottled owl. Common at all times.
Long-eared owl. Rather common, both summer and winter.
Barred owl. Rather common.
Acadian owl. Rare at all times.
Red-tailed hawk. Somewhat common in summer, but rare in winter.
Sparrow hawk. Not very common.
Ruffed grouse. Common at all times.
Quail (*Ortyx Virginianus*). Always in plenty.
Black ducks. Somewhat rare at all times. ARTHUR F. GRAY

THE LABRADOR DUCK.

JACKSONVILLE, Fla., April 10th, 1876.

EDITOR FOREST AND STREAM:—

In answer to Prof. Baird's call for information about the Labrador duck, I would say that twenty-five to thirty years ago it was not uncommon about the mouth of the Bay of Fundy. Soon after it mostly disappeared, so that it was very rare that a fully plumaged male was taken. I have not heard of one for twenty years, but about five years ago I secured a female. These ducks were called by the gunners "pied ducks," and "sand-shoal ducks." I have a pair, male and female, in my collection which were mounted many years ago.

GEORGE A. BOARDMAN.

A MARYLAND CALENDAR.

BOONSBORO, Md., April 12th, 1876.

EDITOR FOREST AND STREAM:—

I was so impressed with the utility of the suggestions contained in your "Invitation," that I secured a calendar at once, and have been careful to watch and make note of the arrival of the spring birds of Washington and Fredrick counties, situated on the northwestern border of Maryland, in the Cumberland Valley. I have good opportunities for observation. Snow-birds, English sparrows, blue birds, meadow larks, and cardinal grosbeaks, have been here all the winter, as is usual for them. On February 12th a few robins were seen, but the weather becoming very cold I saw no more till March 6th, when large numbers came. On February 14th song-sparrows were seen; March 5th, crow-blackbirds; March 6th, red-winged blackbirds in large flocks, and killdeers; March 10th, pheebes or peewees; March 11th, a few snipe, and some wild geese dying northward; March 14th, I saw three snipe, which are never very plentiful here, and a golden-winged woodpecker. The house martins first came April 4th, and by the 10th were in large numbers. W. B. WHEELER, M. D.

ANIMALS BREEDING IN CAPTIVITY.

PHILADELPHIA, April 12th, 1876.

EDITOR FOREST AND STREAM:—

Three prairie wolves (*Canis latrans*) were born at the Zoological Gardens on Sunday morning, April 9th. The period of gestation was sixty-four days. The mother will not allow any one near her babies. Probably this is the only case known of the wolves breeding in captivity. On the morning of April 11th the Javan porcupine (*Hystrix javanica*) gave birth to a fine young one, after an unknown period of gestation. It lived but a few hours, owing to the parent refusing to nurse it. It measured nine inches long, and was well-covered with dark, almost black embryo quills from an eighth to half an inch in length, with long white quill hairs interspersed on the back. The lower part of the neck and belly was clothed with a quantity of dark hair. The whisker hairs were one to one and three quarter inches long. The eyes were open. Two teeth were in each of the jaws, upper and lower, one-eighth of an inch long. Its weight was three-quarters of a pound. Believing that these are the only Javan porcupines ever brought to this country, it is encouraging to be able to report them breeding, although unsuccessful raising their first-born. WALTER K. ASHMEAD.

RECENT ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDEN.—One English rabbit (*Lepus cuniculus*); one pair tigers, male and female, (*Felis regalis*); one jaguar (*Felis onca*); one bittern (*Ardea virescus*). HCON.

RECENT ARRIVALS AT THE CENTRAL PARK MENAGERIE.—One yellow-bellied woodpecker (*Sphyrapicus varius*. Presented by E. J. Dechenhuck; captured on 9th avenue, New York city. One loon (*Colymbus torquatus*). Presented by Dr. Samuel W. Francis, of Newport, R. I. One wood duck (*Aix sponsa*). Presented by Jacob Ruppert; captured in Westchester county, N. Y. Two dog-faced baboons (*Cynocephalus ropcarius*). W. A. CONKLIN, Director.

"OLD RELIABLE."—The Sharps Rifle Company of Bridgeport, Conn. (formerly of Hartford), has adopted the above trade mark—an exceedingly appropriate one under the circumstances, for of the hundreds of thousands made and sold during the past twenty-six years no Sharps rifle, whether in the hands of soldier, hunter, or marksman, has ever failed, when put to the test, to prove itself an "OLD RELIABLE" indeed in all the essentials of simplicity, safety, accuracy, and execution. During all these years the company have been from time to time improving their arms, and are justified in claiming, as they do, that Sharps rifles were "*the best in* 1850, *and are still the best in* 1876." Owing to a long and vexatious litigation among the members of the original Sharps Rifle Manufacturing Company, the production of Sharps rifles was for several years almost discontinued, but in 1875 all of the patents, machinery, etc., were sold to an entirely new organization, specially chartered by the Connecticut legislature. This company has erected extensive works at Bridgeport, where large numbers of these arms are being made. Indeed, the company is now compelled to run extra hours in order to fill their orders. No rifle is permitted to leave their armory until it has been severely tested for strength and accuracy, and every purchaser of a Sharps rifle can rely on having bought a gun that *won't* shoot backward, and *will* shoot just where it is aimed.—*Adv.*

Sea and River Fishing.

FISH IN SEASON IN MAY.

Trout, *Salmo fontinalis*.
Salmon, *Salmo salar*.
Grayling, *Thymallus tricolor*.
Salmon Trout, *Salmo confinis*.
Shad. *Alosa*.
Land-locked Salmon, *Salmo Gloveri*.

FLIES IN SEASON IN MAY.

Black Moy, No. 10.—Body, black; feet, black, wings grayish hyaline.
Cow Dung, No. 10 *and* 11.—Body, and feet, brownish yellow; wings, yellow gray.
Great Dun, No. 9 *and* 8.—Body, purple brown; feet, gray brown; wings, dark gray hyaline; setæ, dark brown annulated with gray.
Red Spinner, No. 10 *and* 9.—Body, bright claret, ribbed with gold tinsel; feet, brick color; wings, gray hyaline; setæ, pale brick color.
Yellow May, No. 10.—Body and feet, pale yellow; wings, pale yellow, mottled with brown; setæ, yellow.
Coachman.—Body, peacock herl; feet, dark red hackle; wings white.
King of the water.—Same as queen of the water, with scarlet body instead of orange.
Gold Spinner.—Body, orange, ribbed with gold tinsel; feet, pale red hackle; wings, bright gray.
Captain.—Body, posterior half, peacock herl, anterior half, gray; white feet; red hackle; wings, gray; setæ, scarlet green, and wood duck feathers mixed.
Soldier.—Body, crimson; feet, red hackle; wings, gray.
Kingdom.—Body, white, ringed with green; feet, peacock herl, and red hackle; wings, gray, mottled with brown.
Black Palmer, Brown Palmer, Red Palmer, and *Gray Palmer,* are made respectively of the different colored hackles that distinguish them.

FISH IN MARKET.—Since the Lenten season has expired prices have fallen somewhat, and the supply, owing to the fine weather, has also been ample. We quote: Striped bass, 15 cents per pound; smelts, 15 cents; salmon, Kennebec, $1; California, 50 cents; frozen 50 cents; mackerel, 25 cents each; shad, North River, 40 cents; Connecticut River, 70 cents each; weak-fish, Southern, 15 cents per pound; white perch, 15 cents; Spanish mackerel, frozen, 50 to 75 cents; green turtle, 20 cents; terrapin, $12 per dozen; halibut, 15 cents; haddock, 8 cents; cod-fish, 8 cents; black fish, 15 cents; flounders, 10 cents; eels, 18 cents; lobsters, 10 cents; turbot, 20 cents; scollops, $1 per gallon; soft clams, 40 to 60 cents per hundred; white-fish, 16 cents per pound; pickerel, 18 cents; brook trout, Canada, 50 cents; Long Island, $1; pompano, $1; hard shell crabs, $3.50 per 100.

—The shad fisheries of the Hudson River between Pleasant Valley and Fort Lee are yielding finely, the average of each lift of the nets being 3,000 fish. Messrs. Dunlop, Ludlow, Acker, and Davis are the largest operators. Something like 40,000 fish were taken in four days.

THE MANUFACTURE OF FISHING RODS.—The little village of Woodbury is most picturesquely situated on the Newburg branch of the Erie Railway, some six miles from Turner's Station, and about eleven from the City of Newburgh. West Point is only four miles distant, and Sumnit and Cromwell's Lakes are in the immediate vicinity. Here is located the factory (the only one, we believe, in the country) of Messrs. Conroy, Bisset and Malleson, the old-established and well known dealers in fishing tackle. We enjoyed the pleasure of inspecting these works last week, and the time not devoted to the "shop" was passed, in company with that well-known fisherman Mr. John Mullaly, and Mr. Malleson, in wandering along the banks of Mineral Spring stream, as lovely a trout brook as one will find within a day's journey of the metropolis. The stream, like all other accessible ones, is "fished to death," yet the persuasive skill of Mr. Mullaly provoked many a rise, and his creel presented a fairly satisfactory appearance at the conclusion of the day. The factory itself is well worth a visit, if it is only to see the automatic lathe which, when adjusted to the proper gauge, will turn out buts, second joints, or tips, of any size, from the lightest fly-rod to the heaviest Newport bass rod. Another peculiarity we noticed was that the ferules, sockets, and bands were formed of solid pieces of metal; that is, they were not soldered. Any one who has witnessed the manipulation of metallic cartridges will have noticed how the metal, from one solid piece cut from a sheet is first bent into a cup-like shape, and then drawn out by powerful machinery to the required thickness. This is the process used in making the metallic work of the rods. Green heart, ash, and lance wood are the woods principally used, the first named being imported from Surinam, and the latter from Cuba. Twenty-five thousand rods are turned out from this factory in the course of a year, and the use of improved machinery in place of hand-labor enables the manufacturers to sell rods at half the prices asked a few years since. The processes of varnishing, finishing and proving are all very thorough and interesting. Water power is the motive used for turning the machinery, the factory being situated at the foot of a beautiful pond, over the dam of which the water falls thirty feet or more. Several trout of a pound weight have been taken from the pond recently and as it is fed by a fine stream in which Messrs. Conroy, Bissett, and Malleson have placed some 15,000 fry, they will soon be able to supply their friends, not only with the paraphanalia requisite for fishing, but with the sport itself. The work at Woodbury comprises, besides the making of rods, the manufacture of gaug-books, spoons, cases, etc., to which will shortly be added lines, water-proofing, and, in fact, everything coming under the head of fishing tackle.

—The annual meeting of the Ogdensburg Angling Association was held at the office of the President, 10 Warren street, New York, April 11th. The reports of the officers exhibited a very satisfactory condition of affairs. Last season was financially successful. Very many large brook trout were taken, several exceeding five pounds in weight. Messrs. Page, Kimball, Reed, Allerton, Williamson, Lazell, Whitehead, Fryc, and Dr. Otis were elected trustees. The officers for 1876-7 are: President, Geo. Shepard Page of New York; Vice President, J. H. Kimball of Maine; Secretary, L. P. Reed, of New York; Treasurer, James A. Williamson of New Jersey. Gentlemen desiring to visit Camp Kennebago, Rangeley, will address the President or Secretary.

—Seth Green has sent us one of his needle point fish hooks with which he claims to have killed 60 brook trout, one of them weighing three-fourths of a pound. It was a fly once, but it shows so much hard service that it is scarcely recognizable, "the fly part being about eaten up," as Mr. Green says in his letter. There is a very considerable belly to the bend of the hook, and the point is longer than usual in proportion to the length of the shank. Mr. Green claims that he can catch one third more fish with it than with any bearded hook.

PENNSYLVANIA—*Philadelphia, April 24th.*—The shore fishing at Gloucester, N. J., began on Monday last. The gillers all along the river are in full blast, and have been for several weeks. On the 15th a gill-net that left the Water-works wharf at Richmond, caught in one drift forty shad, one sucker, and a wild duck. The duck got entangled in one of the float lines, and the catch, according to the captain, was "promiscuous." Up river the catch is good, the fish being plentiful and of fair size, not so good, perhaps, as last year, but away ahead of three or four of the preceding seasons. Of about fifteen gill-nets that went out of the Rancocas last night, the largest catch was 32 shad, and the lowest about 20. Some large rock-fish, and a few sturgeon have been taken down the river.

SCULLS.

VIRGINIA—*Leesburg April 19th.*—Some few (about thirty-six in all) bass have been caught on Goose Creek, near its mouth, at the foot of first dam next the Potomac. The most were caught with angle worms, and some few with minnows, a few weighing over two pounds, the balance small. Two were said to be spawners, but we think the season for spawning will not fully set in until May, continuing until the latter part of July. They seem to have commenced an upward movement from the Potomac into the creek *preparatory* to spawning. As the season advances they will be found higher and higher until about 20th July, when they will be caught anywhere on the creek. They rise but sparingly to the fly, though they have not been tried on a warm day or below the first dam, where they seem to have congregated in greater numbers than elsewhere. T. W.

MARYLAND.—There seems to be no end to the amount of fish caught in the Great Choptank River. A single shipper has sent over the D. & D. railroad over a thousand shad in one day.

MOVEMENTS OF THE FISHING FLEET.—The mackerel fleet of forty odd sail have winged their way southward, and others will soon follow. No mackerel have as yet been reported, but in another week it is anticipated that the first catch of the season will be made. There have been 36 arrivals of the cod and halibut fleet the past week, 33 from Georges and 3 from the Banks, landing in the aggregate 96,000 of Georges halibut, 208,000 lbs. Banks halibut, and 825,000 lbs. Georges codfish. Fresh halibut have fluctuated in price; the last sales were for 6½ and 3½ cents per lb. for white and gray. Georges round fish, $1.75 per cwt. Shore fresh fish in light receipt, sold at $2 per hundred pounds, for cod and haddock.—*Cape Ann Advertiser, April 21st.*

SPLIT BAMBOO RODS.—A Philadelphia correspondent sends the following opinion as to the proper method of constructing bamboo rods. There are certainly excellent rods made by methods very different; and while their respective merits are conceded, it may still be well to discuss and determine, if possible, which is the best:—

PHILADELPHIA, April 17th, 1876.

EDITOR FOREST AND STREAM:—

Your correspondent H. (in the number of April 13th,) offers me a problem in metals and their relative power of resistance in different forms. A scientific question of interest, but of no particular value in our argument on tips. The question is not "whether a hollow link will break away sooner, or withstand the strain any longer than a solid pin of equal weight," but "whether a vent and glued bamboo tip is better with the enamel inside or outside." I claim that it should be made with the enamel *inside*, because in working down you retain the strong part of the material instead of cutting it away. J. B. C.

WATER-PROOFING FISH LINES.

STUDIO 41 TREMONT ST., BOSTON, April 20th, 1876.

EDITOR FOREST AND STREAM:—

In recommending boiled linseed oil for water proofing silk lines, I ought in have said, for the benefit of anglers who have a fancy for preparing their own lines, that common boiled oil does not meet the requirements perfectly. It should be boiled for the purpose by a process that will neutralize or destroy the gelatine which all oil contains a small portion of, and which, unless removed will leave the lines stiff and hard, which is of course to be avoided. The only person that I know of who fully understands what is required, and who knows how to prepare the oil, is Mr. J. Babcock, No 21 Magazine street, Cambridgeport, Mass To those who do not care to take the trouble of water-proofing their own lines, (and I would not recommend any one to do so for it requires much labor and careful manipulation, such as oiling, rubbing, and singling off the small fibres, &c.) I will say, that Messrs. Bradford & Anthony, of Boston, always have on hand, both salmon and trout lines prepared in the best manner. WALTER M. BRACKETT.

GREENWOOD, Mass., April 17th, 1876.

EDITOR FOREST AND STREAM:—

In your paper of the 13th I notice an article on "Water-proofing Fish Lines," soliciting information on the subject. It is a well-known fact that linseed oil, when applied to cotton or linen, soon produces heat, causing the line or fabric to oxidize or rot. Several years since patents were granted to myself for water-proofing all porous substances by the application of paraffine dissolved in naptha or benzine, since which the process has come into extensive use as applied to a great variety of articles. Its adaptation to fish lines, fishing nets, sporting suits, &c., has proved of great utility, increasing their strength and durability two-fold. The application of paraffine by this process forms an invisible varnish, and as paraffine is a non-absorbent and a repellant of water, moisture will not penetrate the substance treated. The substance will be saved from rot, (oxidization). Paraffine is neither decomposed by chlorine, strong acids,

nor alkalies; it also resists in great measure the action of corroding fumes. Unlike linseed oil, it is cold by nature, and cannot generate spontaneous heat. The experience of years has proved it is next to impossible to remove it from my line or fabric when once applied. Fish lines water-proofed by paraffine will run much better through the guides, always having a smooth surface, never leaving the line or net till the same is actually worn out. Sportsmen need have no fear of reeling up a line wet or damp, or leaving it from day to day in a moist condition as they are proof against fungi or mildew. Paraffine prevents the formation of animalculæ and fuagi, or mould. If dark spots appear, they arise from the decomposition of the gluten, generally used at some stages of the manufacture of the lines or fabrics. The preparation remains permanently united with the fibre. Articles treated by it will not grow tenderer after a lapse of time: a permanent increase of strength and security is imparted to them; all colors are given a deeper and richer shade, and made fast. C. TOPPAN.

TWIN LAKES.

CANAAN, Ct., April 18th, 1876.

EDITOR FOREST AND STREAM:—

The Twin Lakes were open at least two weeks earlier than usual, and are now as clear of ice as in mid-summer. Day before yesterday there were "lots" of ducks on the larger lake, shelldrakes, black ducks, &c., but next day they departed. Quite a good many have been shot by different and indifferent sportsmen, and some wild geese have been seen, but too wildly out of range for anything but a rifle shot. Considerable fishing has been done through the ice, and with good success—the pickerel of larger size and more numerous than for many years—thanks to the successful efforts to put a stop to the depredations of the spearsmen, the Salisbury Game Protecting Company, taking the lead in the good work. So far not a torch-light has been seen on either of the "Twins," though in former years dozens of them might be observed from where I write, in a single night.

Trouting began in good earnest on the 15th (the law being off at that date in Connecticut) and our resident artist took three dozen, which weighed five pounds; it will be seen that there were no fingerlings in the lot. The day before, Friday, he tried the hooks over the border, in Berkshire county, Mass., where the law has been off since the 20th of March, and hooked out four brace that measured about ten inches each; and it is told that the four brooks fished gave him a brace each, viz: Sages Ravine, Schaopp brook, Canda brook, and Bartholomew brook, all nice streams when the water is not too high or too low. For ourself, we made an early start on the afternoon of Friday, paid a visit to our young friend Corbin, of the Union Hotel, Canaan, (and a bill of $1.50 for supper, bed, and breakfast) and were off at 6 o'clock next morning on Conn. Western Railroad, to West Norfolk station, and were in sight of the stream, on a not very genial April morning soon after sunrise. Arranging our tackle at the little one horse depot by a good fire, (!) we were soon on the stream, and—*presto!*—out came our first trout of the season, in less time than it takes to write the words. The "take" was not large in number or weight, and as the sun got higher, the snow and ice from old "Haystack Mountain," began to pour into the already swollen stream, there was no more fish on the rise for that day. Hoping (angler like) for better luck, by going farther, we footed it across lots to "Roaring Brook," that comes with a hop, skip, and jump, down the north side of Canaan Mountain, and found the stream on the extreme rampage, flooding its banks and the meadows, and with minature glaciers spanning its ravines, and no trouting to speak of, unless in very emphatic terms. In a month or so it may do to try it again, but not till "fly time" will these turbulent brooks be in all their glory of picturesque and piscatorial beauty; and not till their tributaries are stocked anew will they afford sport as in the olden times, when we (old 67) could go out of a morning and catch with the rudest tackle, from ten to twenty fine trout out of any decent "hole," with scarcely water enough to cover their back fins.

To return to our Twins, our State Commissioners paid us a visit this P. M., and placed some ten thousand *Salmo confinis* into Lake Wanshining, or in the brooks that run into it rather, and it is hoped that these and the 4,000 lake-trout we helped put into it a year ago, will begin to tell in the way of legitimate sport. The same number were placed in the Lakeville Lake—Mon on-scop-o-nuc—and if it can be stocked, this is a good beginning. Yours piscatorally, JIP-SAY.

The Kennel.

WIDE RANGING DOGS.

THE question "How can I break my dog from ranging too widely?" is one which is frequently asked us. In answer let us say that this fault may be overcome with some dogs entirely without punishment or speaking a word to them. And as an instance of the effect of the remedy we allude to, many years ago, while residing at Trenton, N. J., the late Edward Garduer, of Boston, visited us for the purpose of having a week's shooting, and had with him a large-sized black and white setter named "Gull." No doubt some of the older sportsmen of Trentou will remember Mr. G. and his dog "Gull." This dog was one of those wide ranging, high self-willed fellows who kept his master almost constantly calling in his loudest voice in order to keep him anywhere within proper distance, and the constant bellowing for "Gull" we could only endure a day or two. When we suggested to our friend that unless he intended to wake the dead of that neighborhood he had better stop bellowing for "Gull," "well," said he, "what in thunder am I to do? don't you see that as soon as 'Gull' gets into covert he is gone out of sight and hearing?" "Now," said we, "let us ask you one question: Does he not, when he gets off and lost from you try to find you again?" "Oh, yes," he replied, "as soon as he finds he cannot hear me call he commences to look for me very earnestly." "Now," said we, "let us keep on losing him until he gets tired of that kind of thing." So we started in to cover, and kept changing our direction from time to time, and then stopping until he would find us, and the consequence was that before the end of that day he ("Gull") was thoroughly broken of his disagreeable habit, and worked as well as could be wished.

In breaking a young dog he should be made to obey the whistle, and turn at the first sound of it. Some young dogs are so fleet and rash as to require to attach to them a stout check cord heavy enough to check their speed and tire them down. Few dogs, however, are too fast, if they have good noses and are staunch on game. Many persons judge of the speed of their dogs before they have time to run off the wiry edge. We have frequently taken to the field those runaway fellows, but not one of ten of them will keep up the gait more than three or four hours.

—Mr. Chas. F. Bancroft, of Baltimore, has received from Mr. John M. Niall, of Killaloe, County Clare, Ireland, a pair of fine red Irish setter puppies, Guy and Bess, purchased through Mr. Dawson, our Consul at Queenstown. Mr. Niall writes regarding these dogs, "that there is no strain now extant that has the double cross of Hutchinson's famed Bob but his; and that purer, nor better blood never crossed the Atlantic." They are full brother and sister, though of a different litter, to Mr. Jarvis' Kathleen. Guy and Bess have been duly placed in the Kennel Register.

—Dr. S. Fleet Speir, of Brooklyn, has one of the finest kennels of Gordon setters in the country. Visitors at Springfield will have an opportunity of inspecting them. They are all registered in the Kennel Register.

—Mr. Theodore Morford, of Newton, N. J., whose strain of orange and white setters are unequalled in this or any other country, visits Springfield with Don, a son of the celebrated Shipman's Joe, May, and Puss.

THE SPRINGFIELD SHOW.—As our paper is put to press on Wednesday morning we, of course, can give no particulars regarding the great Bench Show of the Springfield Rod and Gun Club, more than to notice the fact that a large party of gentlemen left this city on Tuesday afternoon with their dogs, and that delegations were *en route* from every part of the country. New England will be particularly strong in representation. A very successful show is anticipated.

—Mr. Wm. Jarvis, of Claremont, N. H., has had the misfortune to loose his fine imported Irish setter bitch Vic, full sister to Shamrock. She died on the 11th inst. Mr. Jarvis had succeeded in getting her to work nicely on game, and she promised to be an extraordinary good one as well as very handsome.

—Mr. C. F. Demuth, of Fort Dodge, Iowa, has sold his Irish bitch Kelpie, by Rufus out of Friend, to H. W. Ganse, of Wilmington, Del.

THE IRISH SETTER.

SAVANNAH, Ga., March 18th, 1876.

EDITOR FOREST AND STREAM:—

In your paper of the 2ith February "Nimrod" took up the gauntlet in reply to my article on the question of the color of the Irish setter, which appeared in your columns on the 10th of the same month, and, like many others, he claims red as the only color which the true Irish setter bears. At the same time he left himself unguarded on many points of his argument, thereby exposing himself to the home thrusts of any sportsman who had ever seen one of the "pure type," or who has ever read the oldest writers on the subject. He is much mistaken when he says: "I imagine every setter bred in Ireland to be an Irish setter." I no more consider such to be the case than I do an Englishman born in Ireland to be an Irishman. Any sportsman who has ever seen an Irish setter of pure blood would never fail to know one wherever met, be his color either black, orange or white. He differs as much from an English or Scotch setter as the respective breeds of greyhounds do from each other. In truth, he is what may be termed a gentleman dog, and always shows his nobility no matter what may be the color of his coat or how ragged it seems. To a sportsman there is something in a pure Irish setter which can be seen and felt, but cannot be described. But I am digressing from my point. What, may I ask, did Stonehenge, one of "Nimrod's" authorities, know about the Irish setter? He did not exist during Ireland's best days, in the times of Irish gentlemen, and when their strains of setters were noted all over Europe for their intelligence and purity of blood, but years afterwards, when the Irishman's place was filled by foreigners, and not till then did his works appear, and of what were they made up so far as they relate to the Irish setter? of opinions formed on those of other men, from letters which appeared in the London *Field*, from statements of gentlemen who perhaps owned dogs themselves, or whose friends possessed them of the color in question, and, of course, nothing was left unsaid in its favor. We do not find him referring to other writers, or giving any authority in favor of his assertion, merely mentioning red to be the color, leaving every one to select his own peculiar shade from the crimson, or blood red, to a dark liver. I am well aware that Stonehenge is considered the standard English authority on this subject, but even that does not prove his statements to be correct, and the same may be applied to other writers of the present day. When authors are engaged upon any subject which is intended to interest their readers, they must to a certain extent adopt public sentiment, otherwise their words will not please them. For instance, a Frenchman writing on the Franco-Prussian war would not say France was in the wrong, but should a German treat upon the same subject it would be the reverse. We, therefore, who are really interested in any matter must, of course, search well for authority, and on it base our judgment, but that authority must be reliable. Now let us see how Stonehenge stands as an authority. He says the hair of the setter must be coarse, but gives no reason, no authority for the assertion. Now we all know that all spaniels from the Irish setter to the King Charles have fine wavy hair, while that of the English setter is also fine. This dog, according to writers before Stonehenge, was a cross between the Spanish pointer and Irish setter, and is indebted to the latter for his fine, soft coat. Feel the hair of a setter whelp and that of a pointer one, and see in whose favor the decision will be made. In this matter, then, I do not consider Stonehenge an authority. Again, his authority says liver color is a low g nde indicating a cross of the water spaniel or pointer, and gives no authority in this instance; and herein he is wrong. In the first place there are no liver colored pointers or spaniels. They are, however, of different shades of brown, called liver, and before they shed their hair their color changes, becoming, as it were, faded, the brown having the appearance of a dirty orange, thus showing that their color is made up of orange, red, and black. The true liver color belongs to but one dog, and that dog is the Irish setter, for when he sheds his hair it turns but lighter in color, and shows no orange. The liver color of the Irish setter cannot be made up. We could not obtain it by crossing the light red and black, for that would have an orange tint. The theory of Stonehenge might stand did we have, or could we obtain, a pointer or spaniel of a pure liver color, and did all of his first-class colors belong to no other dog save the setter. This we know is not the case for all colors of the setter, but liver can be counterfeited. Let us see in what manner this may be done, taking first the American reds, called Irish, all shades, from a cigar box to a light crimson. Cross an orange Irish, all shades, from a cigar box to a light crimson. Cross an orange and myself, where a solid brown pointer bitch crossed with an orange and white dog produces light red whelps. Next, the blood red of the latest importations. Cross the liver Irish with the orange and you will have the red which indicates an Irish setter of the purest blood, according to Stonehenge, all the later authorities, and owners of such dogs. Next, the orange. Cross an orange pointer and setter, and you will have that color in all its perfection. Should you have no such pointer, doubtless a number of curs could be found which would fill the figure. Next, the black and tan. Cross the colley, the hound, or the bright red dog with a black one and you will produce this fine color. Again, the black and white. You can find water spaniels, Newfoundlands, springers, cockers, pointers, and any number of curs which will answer your purpose and produce these colors.

According to these facts, then, the authority of Stonehenge does not hold good. What do the writers who lived a hundred years ago say on the subject? They wrote the popular opinion of that day, and for want of older proof to the contrary, we will have to accept them as authority on the subject of color. They say the Irish setter, to be pure, must of necessity be a deep chestnut. There is no person but will have to admit that the fruit of the chestnut tree is a dark red, and that when the word deep is applied to the color, it means the deepest shade it ever arrives at. The height of red is crimson; it lightest shades fade to white, and its darkest deepen into black. Deep chestnut, therefore, means the darkest shade of red, which is liver color. The old authorities do not admit of any other shade of this color, nor do they take any man's dog as a standard, but merely refer to several Irish sportsmen who kept their dogs pure.

Mr. Knox, one of Stonehenge's authorities, states that white should appear on only the breast and forehead, and this is also contrary to what the old writers say on the subject. "Nimrod" says that Frank Forester is not looked upon as an authority, and yet we find the English judges referred to by Stonehenge quoting Forester's opinions. Stonehenge places color according to merit, taking orange and white first, and the Belton Greys fourth. To-day the English judges place the latter at the head of the list, thus showing that the opinion on color is, like the wind, extremely variable, blowing in one direction to-day, in another to-morrow. "Nimrod" quotes Stonehenge as an authority, and at the same time condemns and contradicts himself; for Stonehenge does not admit red in all its shades, with more or less white, which "Nimrod" does, without any authority for such a statement that I am aware of.

"Nimrod" says the man who buys a liver and white dog may look to the purity of his kennel, forgetting that liver is one of the shades of red, and according to his statement, that red in all its shades is the color of the Irish setter. Who are the parties who claim red only as the color of the pure Irish setter? In a majority of instances they are the owners of the red dog of the present day, and would have us believe no other color is pure save that which their own dogs bear. When they claim that particular red only as pure, they condemn their own dogs, for it is only by crossing the orange with the pure liver-colored Irish setter that this color can be obtained, and if orange is not a color belonging to the Irish setter, then all the red dogs which are called Irish are mongrels. The English breeders no doubt produced this particular color by care and attention in breeding, for we cannot find any mention made of it in the old writers. Those of the present day speak mostly of this color in referring to dogs which were bred in England, but the fact of their having been bred there is an proof of their purity; for if English breeders will deliberately make mongrels of their setters and pointers, it cannot be expected they would preserve the Irish setter pure.

I have seen many red dogs, native and imported, called pure Irish setters which differed from the English setter only in color, which is the only point by which unscrupulous dealers are enabled to sell them as pure Irish setters. Many of our sportsmen are taken in by foreign as well as domestic breeders, thinking that all red setters are Irish, not one in a hundred knowing the difference between the Irish and English dog. "Nimrod" says it has been the practice of some dealers to sell to sportsmen dogs of all colors as the pure Irish setters, giving no further evidence than their own word which is as genuine as the dog they sell. This may be so, but such dealers sell at least ten red mongrels for Irish setters to one of any other breed, the color helping them in the fraud.

Should an honest dealer procure a brace of the finest chestnut or liver-red Irish setters coming up in every point to show the purity of their blood, the very same dealers "Nimrod" refers to would condemn them at sight, on account of their color, saying they were impure; that their sterns were too short, their ears too much covered with hair; that by reading the latest authorities on the subject you would find them to be but water spaniels; and finally that the Irish setter should be red—a bright golden red—as "Nimrod" expresses himself, which expression would apply very well to the dog, but not to the deep chestnut color. In this way would the dog of pure extraction be condemned that the golden red mongrels might be advanced, and as nineteen out of twenty purchasers know nothing of the dog, except what they have read and heard from their friends, who perhaps are the owners of some of these golden reds, they are not only taken in and imposed upon, but are at all times ready to condemn every other man's dog which does not come up to their's in color, and to come out in public print and call any man a knave or a fool who asserts that an Irish setter is or may be of any other color than red or red and white, forgetting to add the orange or golden tint, or that it is from that color—the orange—that it gets its brightness. Did our sportsmen study the anatomy of the dog more than his color there would be better dogs in our country and less chance to commit fraud.

The color of the Irish setter, according to the oldest and therefore the best authorities on the subject, was red, or red and white of a deep chestnut—that is, according to the definition of the words deep and chestnut, the darkest shades of red are meant, those of old dark mahogany or the color of a beef liver. Compare these and a chestnut of the darkest hue, and I think you will admit I am correct. The old authorities do not admit that red alone in all its shades is to be accepted as showing the true Irish setter. Black, black and white, orange, and orange and white are equally pure colors, for the same means which changed the color from a deep chestnut or liver-red to all the lightest shades of red, would also change these, and there are to day a greater number of pure black and black and white setters, especially the former, which are in their anatomy finer specimens of the Irish setter than scores of those which are red and red and white and called by the same name. The liver red and the black are, I think, the two colors in which to-day the pure Irish setter is found, for the reason that the first cannot be imitated, and the latter has not been tampered with by the English breeders half as much as the orange and red of lighter shades. The blood red became fashionable only on account of its beauty, and breeders resorted at once to such crossing to secure it that Mr. Laverack might well have said the grand old Irish setter had degenerated when, through ignorance or intention, the pure dog was passed by and the mongrel of one or two shades lighter would be regarded as a perfect type of purity. Has "Nimrod" ever seen a pure liver-red dog? If he had, I do not think he would affirm that water spaniels had such a color in all its perfection. Had he read Thornhill and the other authorities of a hundred years ago, then examined a dark chestnut and a piece of fresh liver, and then referred to Webster's definition of the word deep, he would not have tried to have the shades lighter than nature intended them to be, or as they were described by the older authors, but would have left out the golden tint, and confined himself strictly to the deep chestnut. Hutchinson's "Bob" was a magnificent specimen of the blood red Irish setter, but it was a hundred years before his time, and when he became so noted in Europe, that Ireland was famous for her setters, and it is to those times and their writers that we must refer to find out what the pure Irish setter should be.

"Nimrod" refers also to letters in the London *Field* from, as he says, the most noted of the Irish breeders. Are they bearing the names of those who made Ireland noted for her setters, or are they Irish only by adoption? They must certainly be the latter, for I doubt if there are many of the descendants of those old Irish families who pride themselves on the purity of their setters who are now in a condition to follow in the footsteps of their forefathers. He might as well have referred to English breeders in England as English breeders in Ireland. Their opinions running in the same direction, they follow fashion, and can in no way become identified with the noted Irish breeders of a century ago. "Nimrod" says this subject has caused quite a number of letters to be published in this country and in Europe. In this I agree

with him; but the reason seems to me a plain one. There are probably a hundred light red dogs to one of any other color called Irish, and as the word red was used by the old writers, the breeders and owners of such dogs would force on the public the opinion that a dog of any other color could not be pure. The old color will ever be condemned in favor of the light red, and as the latter is in the majority the weight of evidence, as far as numbers go, will be in favor of it. They are not satisfied with claiming parity in their own dogs, but would try to prove all others mongrels that did not come up to the standard of their own. This may possibly arise from a want of knowledge of the Irish setter, and in fact the premium lists of some of our late bench shows will prove it. For instance, a class is made up of red setters, called Irish, as though the red color was the only difference between the Irish setters and those of other breeds. This will continue until the Irish setter of pure blood is run out, or when premiums are offered for him taking the anatomy of the dog and his get to be the base upon which judgement is to be built. GEORGIA.

THE IRISH SETTER.

April 14th, 1876.

EDITOR FOREST AND STREAM:—

Perhaps there has been enough said on all sides in regard to the color of the Irish setter, but I want space only sufficient in your columns to reply to one or two statements of your correspondent "Charge," and to thank him for the kind advice he gave me. But, perhaps just a little of that advice might as well have been kept at home. Pull the beam out of your own eye friend "Charge," before you try to take out the mote from a neighbor's eye. In your letter of the 7th, you said, "Now, I have a copy of his author, and have searched in vain for the paragraph quoted, and while I do not accuse the writer of a false quotation, I think there is some mistake to this case." I am sorry your search was in vain and that it bore no fruit, for had it been otherwise it possibly might have saved you the trouble of writing your letter. I am convinced that it is with this color question as with many other things, that "none are so blind as those who won't see."

Now, I beg to inform "Charge" that my quotation was not false, that there was no mistake in the case, that I did not say that "Stonehenge" "speaks of the great reputation of the Irish setter," that I have read his works through and find he is consistent. However, I could point out where "Stonehenge" speaks of the excellent qualities of the true Irish dog, but we are not discussing that; and so I'll pass it. The only proper place to discuss that is in the field and before the gun.

And now I have a new bit of advice to give you, my friend "Charge," look before you leap, read not only through the work, but the works of an author when he has more than one on the same subject. If you, who gives such good advice, had done this, you would not have looked in vain for my quotations. I quoted in my former letter from 'Idstone," and from "Stonehenge's" works, whom "Idstone" acknowledges the greatest living authority, and backed them both up by Laverack, and one and all undeniably assert the same thing. I quoted from the best acknowledged breeders in Ireland, and the story is the same. I ignore no authority of modern times, but state my belief upon the side that contains the greatest and most trustworthy evidence. Modern authors have got the necessary data to establish the color of the Irish setter, and if they establish it different from that which certain ones desire, why, then these certain ones try to establish a type to suit themselves. But to do this is rather up hill work, and so they will find it. "Charge" would have us believe that "Stonehenge" is not authority. If he is not, who the deuce is? It ought to be some one, I suppose, who says the Irish setter, Simon pure, is to be found of all colors. You can make me believe that when you prove that "Stonehenge," "Idstone," and "Laverack," did not know what they were writing about.

When "Stonehenge" speaks of judging dogs by their color, or rather of choosing dogs by their color, he does not refer to the color of the Irish setter, but only to the choosing of a puppy from a litter, with an idea that because it happens to be marked like a noted ancestor, it will also be a noted dog. And now a parting, word, my kind friend "Charge," and I too am done on this color question. Don't ever again advise a friend to read through the work of an author until you have yourself read not only the work, but the works, of that author. It is not from the reading of one book we gather knowledge, but from the reading of many. One swallow does not make a summer. I am glad "Charge," that you desire to investigate further search among modern writers, for it is too evident that there are *some* who need to make that search. MONT CLARE.

ANOTHER WAIF.

WEST PHILADELPHIA, April 20th 1876.

EDITOR FOREST AND STREAM:—

I notice in Kennel Department of FOREST AND STREAM of April 20th, 1876, that Mr. John T. Underhill claims the name of "Waif" for his black setter dog with white nose and feet. Although I do not suppose but that there can be 100 dogs named Waif, this name is rightly, and at the same time, almost a year ago was given to my orange ticked setter dog, out of Glidersleeve's Nellie, by Pride of the Border. Waif will be one year old May 26th, 1876, and with his sister Orphina, was raised by me on the bottle, never having sucked their mother, and for the reason that they were motherless the names above were given. T. ROAN.

[Mr. Roan's dog certainly seems to come rightfully by the name, and, no doubt, Mr. Underhill would "waif" his claim to it. However, as the dogs are of different strains and colors, and are widely separated we question whether it is of much consequence.—ED.]

CENTENNIAL BOATING NOTES.

[FROM OUR OWN CORRESPONDENT.]

PHILADELPHIA, April 24th, 1876.

The arrangements of the Committee for the Centennial Regatta are going steadily forward. Of course no entries have as yet been received, nor at this time can any be expected. The crews that are certain to be here from Great Britain, as guaranteed by Col. Sanford of the British Commission, are not yet announced. This much is known, however, that Dublin will send from her two clubs one four, and a sculler (Mr. Labat). During their stay they will be the guests personally of Commodore Ferguson, and as a club, of the Bachelor's Barge Club, where their boats will be quartered. One of the other fours will be from Cambridge, and another from the London Rowing Club. The remaining one will be from either the Leander or the Royal Chester. I hope in my next to be able to give the names of the crews, or at the very least, say authoritatively what clubs the crews will represent. France is certain to be represented, as her champion sculler will come alone if he cannot bring a four-oared crew as he hopes to do. If the Schuylkill Navy would arrange for all the races that are proposed there would not be time in the whole summer to row them.

The Committee has been asked to make a place for barges, four-oared, six oared, ten-oared, and twelve-oared; for a whale boat race; for a canoe race, and are daily expecting to receive an application to offer a prize for a race open to Chinese junks.

Crews are coming from everywhere, with all sorts of boats, but how the Schuylkill Navy is going to house and care for more than those who will accept their invitation is more than any one can say.

Places will, no doubt, be made for a number of races other than those on the programme, but the Regatta Committe cannot be expected to provide prizes for them.

The Freshman's Rowing Association, of Halifax, would like to see the professional races rowed on the Delaware, so that a five mile course could be secured, but the propricty of of an association calling themselves the Schuylkill Navy, and organized as it is, holding a regatta on the Delaware is more than doubtful. According to the circular of the Committee the amounts of the purses for the professional races should be announced by the first proximo. This amount is not rapidly forthcoming, but before the 11th has passed no doubt it will be all in hand. The amateur prizes have all been selected, and the designs promise the handsomest ever offered.

Mr. E. R. Craft, of the Argonauta Club, has been very active in furthering every interest of the regatta, and if, outside of Philadelphia, a half dozen others on whom the Committee has as great claim, would exert themselves as much all trouble would be ended. SCULLS.

—We are informed that the report which has been published recently, to the effect that Mr. Eldred, stroke of the Argonauta crew, who was so unfortunately shot while in Florida, will be unable to row again, is incorrect. Mr. Eldred will in all probability retain his place in the crew.

—Gesling, the champion oarsman of France, will take part in the Centennial regatta at Philadelphia.

—The Baltimore boat clubs intend to make the season active. The Undines have already challenged the Ariels and L'Hirondelles to a four-oared shell race in June.

—The Boston and City Point clubs are now in daily practice on the Charles River for the race on May 6th.

—It is said that the Cambridge winning eight will visit this country, but we doubt their coming as an eight.

—The sloop yacht Undine, Brooklyn Yacht Club, went down the bay Saturday afternoon, and the schooner yacht Comet, W. H. Langley, New York Yacht Club, made her first trip for the season the same day.

—Gilbert Smith, of Hempstead, has just completed a handsome new sloop yacht, rigged in first-class style, 31 feet keel, 14 feet beam, and 3½ feet depth of hold. She is called the Josephine.

—H. Floyd Johnsou, of East Rockaway, has just completed a sloop yacht 30 feet keel, 37½ on deck, 13 feet beam, and 3 feet 2 inches depth of hold.

—An entertainment in aid of the Harvard University crew will be given under the auspices of the Harvard Club of New York City, at the Theatre of the Union League Club, Monday, May 8th, at 8 o'clock. Tickets can be procured by addressing Montgomery D. Parker, 21 Brevoort Place, or at G. P. Putnam's Sons, Twenty-third street and Fourth avenue; price $2.

—Through an oversight, the new edition of the Constitution and By-laws of the National Association of Amateur Oarsmen does not contain the proper text of Regatta Rule No. 2. The following is the true wording of the section, as recommended by the last special meeting of the association, and adopted at a meeting of the executive committee, held January 20th, 1876. We would suggest to our boating readers that they clip it out and put it in their copy of the "Manual," if they possess one:—

2. Any member of the club to which the individual whose status is being investigated belongs, who shall be required to so do by the committee having the matter in charge, shall furnish said committee with his written declaration upon honor, that to the best of his knowledge and belief, the oarsman in question is eligible under the association's definition of an amateur; and if an entry is designed to be made for a regatta, that he has been a member of the club from which he then proposes to enter, and has not been entered in any race from any other club, for three months preceding the date of said regatta.

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

L. L. V., Beverly, Mass.—Will you please inform me through your paper what to do for weak eyes in a young dog? Ans. Take of borax 20 grains; camphor water, 3 oz.; bathe his eyes with this two or three times a day.

H. C. J., Springfield, Mass.—Will you favor me with your opinion as to where I can find the best description of spaniels, cockers, springer, Irish water, and retrivers? Ans. Stonehenge on the Dog, published by Lee & Shepard, Boston.

L. H. J., Quincy, Ill.—Do you think the Frank Wesson 32-calibre 20-inch barrel pocket rifle accurate at 200 yards, and of whom can I get them in Chicago? Ans. 200 yards is rather too far for a 20 inch barrel. You can buy them of almost any gun dealer in Chicago.

FRANK, Allentown, Pa.—1. Where can I get a paper that is all full of Gun Dealers and Ammunition? 2. Where can I get the Cape Ann *Advertiser*? Ans. 1. We know of no paper that is devoted exclusively to Guns and Ammunition. 2. Published at Gloucester, Mass., every Saturday.

SUMAH, N. Y.—Where can I purchase a good railroad map of Ohio and Pennsylvania, which gives names and populations of post offices under 5,000; also state the price of such, if known? Ans. From G. W. & C. B. Colton, No 172 William street, this city; prices from 50c. to $1.50.

HENRY, Cambridge, N. Y.—I intend to take a trip to Oregon soon. Which is the best route? Where will I find the best salmon and trout fishing? Ans. Rail to San Francisco, and thence steamer to Kalama on the Columbia; thence rail and river to best fishing points, both for trout and salmon.

EXTRACTOR, Newton, Mass.—I have a finely-made, double-barreled breech-loader, 12 gauge, 30-inch barrel. A friend advises me to have the barrels shortened to 28 inches. Do you do the same? Ans. We consider 30 inches the proper length for a barrel, and would not advise you to reduce it.

B. A. M.—Will you please inform me where can be bought bamboo cane, and also live quail, and what would be the price per dozen? Ans. You can buy bamboo of Messrs. Conroy, Bissett & Malleson, No. 65 Fulton street. Too late for live quail. Messrs. Whitley & Morris, of Washington Market, deal in them.

J. A. B., New York.—Will you be so kind as to tell me the weight of the sneak boat spoken of in your issue of the 23 ult., and if it would stand being made of ¾-inch boards, instead of 1? Ans. We do not know the weight, but will ascertain; ¾ inch boards would be rather light, but if properly ribbed and fastened, would answer.

A. B. M., West Meriden.—Please give me some good receipt for waterproof blacking or boot grease. Ans. Take ½ pound of shoemaker's lubbing, ½ pint linseed oil, ½ pint strong solution of India rubber. Dissolve the whole with a gentle heat (it is very inflammable), and apply with an ordinary blacking brush. One application will insure dry feet for several months.

H. H. J., Greenwich. 1. Where can I get the book, American Kennel and Sporting Field, by Arnold Burges, and what price? 2. Where can I get Dinks, Hutchinson, & Mayhew, and price? Which is the best by which to train a young pointer or setter? Ans. 1. From Messrs. J. B. Ford & Co., this city; price $4. 2. We can send it; price $3. Both contain instructions for breaking.

FISHER, Alleghany, Pa.—Where can I find good fishing for bass, etc., in the vicinity of Pittsburgh? Ans. At Conneaut Lake. Take Pittsburgh & Erie Railroad to Transfer Junction, then rail to Evansburg and a hack two miles. Go to old Phil Miller's house. He will minister to all your wants at low rates. Distance is about 100 miles. Don't know of any good bass fishing in the rivers.

C. L. I., Philadelphia.—Will you please inform me when the "Catalogue of Guns and Game Laws of all the States, and Summary of the London Gun Trial," advertised by H. C. Squires as "ready March 1st," will really be ready? I sent for it two months ago, and have not received it yet. Ans. The catalogue will be issued within two weeks. It has been delayed in order to get some cuts from England.

M. O. W., New York. 1. Do you think I would find any ducks or snipe on the New Jersey coast between the 1st and 15th of May, and if so what kind? 2. What size shot do you consider best for ducks? What for snipe? 3. Would it be necessary to have a boat to hunt ducks in, and would I have to have a guide? Ans. 1. Rather late for ducks and snipe. 2. No. 4 for ducks; No. 9 and 10 for snipe. 3. Yes.

SALMO, Windsor, Nova Scotia.—Is there any pleasant part of Virginia possessed of a healthy climate and good schools for children, where a family could settle on a small farm and live comfortably on a capital of $8,000 and an additional income of $1,000. A neighborhood where good shooting and fishing are to be had preferred? Ans. We can recommend Marion, Smyth Co., Va., without hesitation. It completely fills the bill.

NERO, Dubuque. 1. Can you tell me the address of P. Powell & son, mentioned in last weeks paper by J. H. D., Milwaukee? 2. Can you tell me the address of some good gunsmiths, who have on hand good muzzle-loaders. All of the gunsmiths advertise breech-loaders but I do not want one? Ans. 1. Messrs. P. Powell & Son are in Cincinnati. 2. All of the gun dealers advertising in our paper keep muzzle loaders as well as breech-loaders in stock.

J. W. S., Providence, R. I.—How can you tell the difference between a twist and a laminated steel barrel; also what is the difference between a plain and a stub twist? Ans. To the twist barrel the lines run with perfect regularity; the laminated barrel being hammered, the surface presents an irregular appearance. In a stub twist barrel the material is rolled as in Damascus or laminated, but less twisted. The common twist is made of inferior metal and scraps, but is also twisted.

TAHAWUS, Newark.—Can you inform a subscriber whether Blue Mountain's Lake in the Adirondacks can be reached by way of the Adirondack Railroad, and whether there is a hotel there? Ans. Leave the cars at North Creek for Long Lake *via* Minerva, and for Washburne's on the Indian River; Jackson's on the Cedar River, and Blue Mountain Lake *via*. North River. There is a new Hotel at Blue Mountain Lake, finished last year, and there will be a fair carriage road this year to the lake. This side of Jackson's the road is good.

HUNTER, Newark.—Will you kindly inform me through your Correspondent Columns if there is any thing I can do for a young setter (10 months old) that has got a poor nose. She is well broken in every respect, but does not seem to scent a bird well. She had the distemper very bad this winter and I think that is the cause. The nose is very dry and feverish; feed her on boiled meal and scraps? Ans. If time, plenty of exercise, and such food as you are feeding your setter, does not bring her around all right, we do not know what will.

W. H. S., Philadelphia.—1. Where in Philadelphia can the Kay concentrator be bought, and how much are they worth a hundred? 2. Is the $100 Greener breech-loading shot gun considered a good and safe gun? 3. What is the standing of the Remington $45 gun, how do they shoot and wear, and are they considered as safe as higher priced guns? Ans. 1. At John Krider's gun store, Second and Walnut streets, price $3.50 per 100. 2. Yes. 3. The $45 Remington is a good, safe, serviceable gun. Their $65 and $75 guns are better finished, and worth the difference in price.

QUAIL, Boston.—Will you kindly inform me, through your columns, what is the best time to stock a piece of ground with quails, within fifteen miles of Boston; also where they can be procured, and what they will probably cost per pair or dozen? Ans. Much depends upon the season. The birds should be put as soon as there is a reasonable prospect of fine weather; this year, for instance, the middle of April would have been soon enough. The earlier birds are out the sooner they will breed. It is now too late to procure birds, but we will assist you in getting them for next season.

TARGET, Lowell, Mass.—1. What shell had I better use for one discharge, to be then thrown away? 2. Is English shot just one size smaller than American of same nominal numbering? 3. Where can I get Kay's shot cartridge; can find none except Eley's in hands of Boston dealers, and they claim that these—Eley's—are the best. Is it so? 4. Is a pattern of 88 to 103 with one oz. No. 7 Tatham shot, 30-inch circle, 40 yards, straight bore, 12 gauge, 28-inch barrel, 7¼-pound gun as good as should be expected from a $200 Scott gun, and if not, what would be an ordinary good pattern? 5. As I have the gun mentioned which answers for light shooting, what weight, length of barrel, etc., breech-loader, would you advise getting for shore shooting from middle of Aug. to close of season? 6. If I try to get one for $60 or $75, what American maker can you recommend as safe and serviceable? Ans. 1. Union metallic brown shells or Eley's brown shells. 2. Tatham & Bros. N. Y. shot No. 6 has 218 pellets to the ounce. Walker & Parker English shot No 6 has 280 pellets to the ounce. 3. Kay's improved concentrating cartridges are decidedly the best, and can be had at any of the gun dealers advertising in our columns (certainly in this city). 4. 100 pellets would be a good average. 5. Your gun is large enough for bay bird shooting, but for ducks you should have a 10-gauge, 32-inch, 10-pound gun. 6. A $60 or $75 Remington is a safe and serviceable gun.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCULCATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,

[POST OFFICE BOX 2832.]

123 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty-five per cent. allowed for five copies and upwards.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent.; over six months, 30 per cent.

NEW YORK, THURSDAY, APRIL 27, 1876.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Editor.

WILLIAM C. HARRIS, Business Manager.

CALENDAR OF EVENTS FOR THE COMING WEEK.

THURSDAY, April 27th.—Bench Show of Dogs, Springfield, Mass. Base Ball: Louisville vs. Chicago, at Louisville; Hartford vs. Brooklyn, at Brooklyn; Boston vs. New Haven, at Providence.

FRIDAY, April 28th.—Rifle: Spring meeting Yonkers Rifle Association, at Yonkers. Base Ball: Boston vs. New Haven, at Fall River.

SATURDAY, April 29th.—Rifle: Yonkers Rifle Association, at Yonkers. Base Ball: Chicago vs. Cincinnati, at Cincinnati; St. Louis vs. Louisville, at Louisville.

TUESDAY, May 2d.—Racing: Nashville, Tenn. Trotting: Washington, D. C.

WEDNESDAY, May 3d.—Racing: Nashville, Tenn. Trotting: Washington, D. C. Base Ball: St. Louis vs. Louisville, at Louisville.

OUR CENTENNIAL HEADQUARTERS. — Friends of our paper visiting Philadelphia during the Centennial will find a warm welcome at the office which we have fitted up for their reception and entertainment at No. 123 South Third street. It will be under the special charge of our Mr. Harris, assisted by M. M. Barker, Esq., who is already well known to our Western friends. The office is fitted with easy chairs, writing materials, files of papers, etc., and we place it and its facilities freely at the disposal of our readers. When tired of sight-seeing drop into the FOREST AND STREAM office and rest and read the papers.

THE BRAZILIAN EMPEROR.—Dom Pedro is now enjoying the sights and climate of the Pacific Slope. Long journeys for crowned heads are coming into vogue, but probably our present visitor has taken a longer trip by rail than has ever fallen to the lot of any other potentate. He chose the Erie Railway for the first stage of his journey, and has enjoyed the comforts of a palace even while in motion.

BROOK TROUT.—We are glad to see that E. Sherman Pease's two pictures of trout were sold from the walls of the Academy of Design, (late water-color exhibition,) at the good price of $60 for the pair. They were in water-color, and found special favor with artists who saw them. There is a trout picture, in oil, in the present exhibition, that some of our picture-buying readers may be glad to look at.

FOREST AND STREAM AT THE CENTENNIAL.

THE "HUNTER'S CAMP."

IN view of the near approach of the opening of the Centennial Exhibition at Philadelphia, it may be well to state what this journal (FOREST AND STREAM,) has been doing within the past year to add to the attractions of the show.

It was an early conception of ours to bring together at Philadelphia a collection of all the apparatus and implements used by sportsmen, by land and water, or that might legitimately fall within the province of sport, and also to illustrate the habits and life of sportsmen and the creatures they pursue, by an exhibition of a genuine hunters camp and appliances; methods of trapping, fishing and shooting; specimens of wigwams, canoes, tents, etc. Accordingly in February, 1875, we intimated our purpose to the Exhibition Directory, and arranged for an inner space of 1,200 feet in the main building, where guns, tackle and the like might be on view, and for an outside space on the grounds where the camp might be located. Six months afterwards, learning that Professor Baird was engaged in a kindred project, and aware of the importance of a unity of action, and the facilities he possessed for collecting, we arranged with him to incorporate our display of sportmens goods and implements with his, for what is known as the Government Exhibition. Ever since then we have worked in behalf of the joint and consolidated enterprise, the supervision and labor of collecting the materials of certain departments having been assigned to us.

We are pleased to know that the collection will possess an absorbing interest to all persons fond of field sports, natural history and out-door pastimes.

But what we aim more particularly to impress upon the public is the fact that the most unique and original part and feature of what was intended should comprise the FOREST AND STREAM exhibition, namely, the "*Hunter's Camp*," has not and never had any touch, foundation or handiwork other than our own, and it stands to-day in all its primitive grotesqueness as one of the most attractive objects on the Exhibition grounds. It is located in a deep ravine near the Horticultural Hall, which overlooks it, and only a few rods from the grand music stand. It is but five minutes walk from the principal buildings. Its central object is the log-cabin built in hunter fashion, standing near a natural mountain stream that tumbles over rocks, shaded by a grove that will make the place delightfully cool in summer. A genuine trapper, in full panoply of beads and buck-skin, is in attendance, and some one of the backwoods fraternity, either Pale-face or Red-man, will always be found on hand throughout the season. As completed, the picture shows venison and other game hung up near by, with camp equipage and cooking utensils at hand, the blue smoke of a camp fire rising; canoes partly drawn on shore from a pool of still water made by an eddy of the stream, and other features which Adirondack visitors will recognize at once, and some, perhaps, from which they can gather instruction.

The locality of this "Hunter's Camp" will be indicated by finger boards lettered "*Forest and Stream Camp*," which the Directory have kindly given us permission to erect, and we cannot express our thanks too warmly toward Mr. Goshorn, the Director General; Mr. Schwarzman, the Chief-Engineer, and Mr. Hamill, Secretary, for the special efforts they have made to promote our efforts and make the exhibition attractive and a success.

Having said this much, we may be pardoned for referring to the following paragraph which has been printed in the Oswego *Times*, and copied freely:—

"Prof. Baird, of the Smithsonian Institute, at Washington, has written a letter to Mr. John A. Nichols, of Syracuse, inviting him to take charge of the Sportsmen's Camp at the Centennial Exhibition. The camp will consist of a log cabin, tents, canoes and all the apparatus necessary for complete outfit of a hunter's encampment. The appointment is an excellent one, and we know of no one so well qualified to fill the position as Captain Nichols."

The above is altogether a misconception—Captain Nichols has kindly placed his hunting and fishing outfit at the disposal of FOREST AND STREAM, and we propose to place it in the Sportmen's Outfit Department in the Government building, which department, as we have said, was placed under our special charge by Professor Baird of the Smithsonian Institute. There will be but one "Hunter's Camp" upon the Centennial grounds, and that one is solely the idea and property of FOREST AND STREAM. We are in receipt of the following letter from Mr. Nichols, which speaks for itself:—

SYRACUSE, N. Y., April 22, 1876.

GENTLEMEN:—

The paragraph published in various papers, announcing that Prof. Baird has tendered me the charge of the "Hunters Camp" at the Centennial, is a mistake. I have had no correspondence with Prof. Baird, and have no connection with the "Hunters Camp," which you so happily conceived, and which I found on a recent visit to Philadelphia nearly completed, and so admirably representative of life in the back-woods. The collection I promised you of hunting and fishing goods, is now being packed and will be forwarded at an early date.

Yours very truly, JOHN A. NICHOLS.

Our contemporaries, particularly those in the northern part of this State, will please make a note of the above.

—Strawberries are selling at twenty-five cents a quart in St. Augustine, Fla.

—A moose six feet high is on exhibition at Halifax, Nova Scotia. It is to go to the Centennial.

COACHING.

AT least one of the pastimes peculiar to England, and which might be termed "amateur coaching," has been successfully introduced into this country, as was made amply manifest by the splendid display of the Coaching Club on Saturday last. In fact, it might almost be called a triumphal procession so great was the excitement and anxiety to witness the turn out. One not knowing the cause would have imagined that a procession was in order, or that the "Seventh" were having a parade, from the appearance of Fifth avenue. Those stately mansions, whose closed shutters invariably suggest the idea that the family are living in the back parlor, were thrown open and displayed some signs of being inhabited. Six four-in-hand teams started from Madison square shortly after four o'clock and proceeded up Fifth avenue and through Central Park as far as Stetson's, where they turned and retraced their steps, following the avenue as far as Washington square; thence to Madison square again, where they disbanded.

When the start was made, Mr. William Jay led with his English coach, formerly of the Dorking Road, drawn by two bays, a brown and a chestnut horse. Next came Mr. Frederic Brousou's drag drawn by four spanking bays. Mr. Delancey Kane, who will soon begin running a public coach from the Brunswick Hotel to New Rochelle, followed next with what he calls his "city team"—the four horses which will draw the public coach—a black, a bay, a brown, and a chestnut. Mr. James Gordon Bennett followed, driving four fine chestnuts; Mr. Leonard Jerome with four bays, and Mr. William P. Douglass with four bays. A number of guests, both ladies and gentlemen, were on the tops of the coaches, and the leaders of fashion on the box seats divided the admiration of the crowd with the leaders on the teams. Horns were conspicuous by their absence, and we were glad to notice the omission of this snobbish accessory. Before the next display more fine teams will be added to the club, and coaching will have become firmly established. For those who can afford it, there can be no more popular or healthy amusement. It necessitates out of door exercise, and inculcates self reliance and readiness. By the by, Mr. Bennett's twenty Polo ponies have arrived from Texas in charge of two Mexicans. They were not in first-rate condition, (the ponies we mean, we are not informed as to the *Mexicanos*,) but have been turned out to pasture, and will soon be ready for the first lessons.

HORSE SHOES AND SHOEING.

ON an average horses require shoeing once a month. The length of time a shoe will wear depends much on the kind of service a horse is doing, and on the kind of road he is daily travelling. A team horse in heavy draught does not wear out as many shoes as one used in a hack; quick motion grinds shoes down more rapidly than slow use. Some pavement is harder on shoes than an ordinary road, while the friction of a gravelly road wears them away rapidly. Wooden pavement is but a little saving to the wear and tear of shoes, for the grit and dust which become impacted in the interstices of the wooden block grinds away shoes like the friction of an emory wheel.

The hind shoes wear out first, and there is more strain and friction on them than on the forward shoes. It is impossible and improper for a horse to wear shoes more than six weeks, for the growth of the foot shortens the shoe, as well as changes the shape otherwise. The neglect will cause the shoe to encroach upon the soft textures of the foot and produce lameness.

The greatest amount of custom to the blacksmith comes from the teamsters and expressmen and livery men. Omnibus and railroad companies have their own forges and do their own shoeing.

The process of making a horseshoe is familiar to every school boy, who has often lingered at the smithy door and listened to the wheezing of the asthmatic bellows, and when the foot is paired woudered that it did not bleed. Again, he has seen the strong-armed workman pluck the piece of glowing metal from the bright fire, and with the hammer give it repeated blows, and give it shape by curling it over the anvil point. Heating again and again, the iron he pounds maliciously causing the hissing sparks to fly in all directions, until at length a shoe is formed complete.

This tedious process is superceded by machinery, and now like a doughnut a shoe is cut out of a sheet of steel, shaped, creased and punched precisely as if done by hand. More shoes can be made by machinery in one day than a blacksmith can make by a forge in a week, and, too, equally as good in all respects.

The matter of horseshoeing is of great interest to owners of horse flesh, for every one has an idea how the shoe should be shaped and fitted to enable the beast to travel to his notion. If he overreaches, interferes, or stumbles, the blacksmith is held responsible. It is true a skillful mechanic can do much to remedy these evils. There are but a few practical mechanics who have sufficiently studied the foot of the horse. It is not enough to know the anatomy of the foot, and where to insert a nail not to cause pain, but the foot should be studied in the state of nature before the mechanism of man has by artificial appliance been distorted it. The shape of the hoof of the wild horse, or of one who has never been shoed, should be taken as a model. The foot is then properly balanced, neither too long nor too broad, but it has adjusted itself to nature

and the muscles and tendons are not strained by travel. Confinement and unskillful shoeing changes the anatomical relations of the foot, and the best judgment of the mechanic is often taxed to correct the growing deformity—from unskillful shoeing. When a reasoning, skillful mechanic is found the horse is safe in his hands, for he only preserves the normal shape of the hoof, and adjusts the shoe to protect it.

The frog in the hoof of the horse is placed there for a particular purpose and should not be cut by the shoer. If this is allowed contraction and lameness will follow. The shape and weight of the shoe should be accommodated to the purposes for which they are designed. The track horse requires a shoe lighter and without corks, while the draught horse must have a heavy broad shoe with corks to enable him to obtain foothold and travel with the least possible strain. The sporting horse should be shod lightly with a swell at the heel and toe; the best nails should be selected, and care used in clinching, for the casting of a shoe during the chase is of great inconvenience, and might throw the horse and jeopardize the limbs and life of the rider.

CONCENTRATING CARTRIDGES AND CHOKE-BORES.

It is with much pleasure we are able to say to our brother sportsmen that at length a shot cartridge has been invented which is surely effectual in preventing the too wide spreading of the charge at long range, and one which distributes the shot evenly, and at the same time making a decidedly better penetrator than a loose charge. We allude to the cartridges invented and manufactured by Messrs. Kay & Co., of Newark, N. J. There are few sportsmen, if any, who have given this subject more attention than we have, and we found many years ago that an ordinary gun would scatter the shot to such a degree that few, if any, guns could be depended upon to kill, surely, beyond a distance of from thirty-five to forty yards. It is true that a gun that will kill clean at forty yards, when held right, shoots as close as it is desirable to have a gun shoot for all ordinary upland shooting. Every skillful shooter knows that in quail, woodcock, and ruffed grouse shooting that at least eight birds out of ten are killed within thirty yards; one-half are killed within twenty-five yards, and very many are killed by snap shooting, in dense coverts, within twenty yards. Consequently choke-bore guns, or concentrating cartridges, would not be as effectual and desirable for such shooting as loose shot from an ordinary gun for the reason that in shooting in such coverts with a choke-bore or concentrating cartridges the birds would either be missed or so mutilated with shot that missing had been better. And if it was only for such shooting as the above that we needed a gun concentrating cartridges and choke-bores would be useless, but all shooters know that such is not the case. Owing to the increase of population in our country the draining of swamps and clearing of coverts game is becoming much more difficult to approach, and that something is required to meet the emergency; and then, for grouse shooting on the prairie after the 10th September, for duck shooting, for snipe shooting when the birds are wild, and for any kind of shooting outside of forty yards it becomes absolutely necessary that we should have something better than we have heretofore used, and this important point has been attained in two ways, one by the choke-boring of guns, and the other by the invention of the Kay concentrating cartridge. Some of our shooting friends who are using choke-bore guns for long range shooting speak in the highest terms of them, and if such guns will continue to hold their form so as to concentrate the shot there will certainly be a great demand for them from those who do most of their shooting at long range. But the very important qualification of the concentrating cartridges is that it enables the shooter to use the *same* gun for long or short range shooting. During our long-continued experience in field sports we have thoroughly tried all the different styles of concentrators to be found, and about twenty-five years ago we had a machine concentrated, with which we thought cartridges could be made which would concentrate the shot, but like all others which we had tried it was a failure, for with this and all other so-called concentrators which we have ever tried we could find no regularity in the distribution and penetration of the shot. Some of cartridges would not open at all, and consequently the load was lost. Some would break up in the gun, and then not be as effective as loose shot. But last week we devoted a day to experimenting with the Kay concentrating cartridge, and after full and careful trial of them we are fully convinced that we at length have a concentrating cartridge which we may entirely depend upon to do what is expected of it, viz., make an exceedingly close, uniform spread of the shot and deep penetration. We did the shooting with our 12-gauge 7½ to 30-inch Tolley gun; 40 yards; target 30 inch diameter; 3¼ drs. powder and 1⅛ oz. shot, with the following result: 5 shots with No. 9 shot, the average was 400 pellets; with No. 7 shot, the average 234; with No. 6 shot, 160; with No. 4 shot, 84; with No. 2 shot, 68.

Minnesota.—At the regular meeting of the Rochester (Minn.) Sportsmen's Club, March 4th, 1876, the following persons were elected for the ensuing year:—G. K. Saylor, President; Thomas Ireland, Vice President; L. E. Crane, Secretary and Treasurer; A. M. Ellethorp, Aaron Ozmun, Executive Committee. The Club have a valuable library, and all the leading sporting papers are found on the tables. Thirty-four members are enrolled, among whom are found the best citizens.

GAME PROTECTION.

—The residents of Prince Edwards Island have organized a club for the protection of fish and game.

—One branch of the Connecticut Legislature has passed a bill prohibiting, under penalty of $10 fine, the having of dead trout in possession between October 1st and April 1st.

—A sportsman's club has been formed in Geneseo, to be known as the Geneseo Sportsman's Club. It starts with twenty members, all "good men and true," and has for officers the following gentlemen:—President, John Rorbach; Vice President, M. HawleyRector; Secretary, W. T. Howard; Treasurer, I. J. Statton.

—The Mississippi Legislature has amended the Game Law which we printed last week, so that it is necessary to substitute the 15th of March for the 1st of April, 1st of May, and 15th of May wherever such dates occur.

Our correspondent Von G., of West Meriden, Ct., urges the desirability of uniformity in the laws of the New England States regulating trout fishing. He says:—

"The season for trout fishing in Connecticut is now from April 15th until July 1st, and there exists much dissatisfaction among the lovers of the rod, for the reason that the pot fishers clean out the streams before the law is off, leaving poor pickings for those who respect and obey the laws. Some of our soundest sportsmen claim that the law should be the same in all the New England States, and that trout fishing should begin on the 1st of March.

"Not a hundred miles from here is a brook in which occasionally a few trout may be caught, and on Fast day, one day before the law was off, a few young men and boys patrolled the banks of the stream all day determined to prevent the large number of pot-fishermen who usually congregate there, from fishing in the brook, and I understand they drove away from the stream *no less than thirteen of the potters.* Well done! The Connecticut Sportsmen's Association will meet next month at Hartford, and I think there will be a larger attendance of sportsmen than ever, for all now see the necessity of obtaining good game laws such as can be enforced, or else the game and fish in this State will soon be played out."

—The report of the Game and Inland Fishery Protection Society of Nova Scotia, contains the gratifying information that the steps taken by the Legislature for protecting wild animals and birds have been successful. The moose which, by reckless killing, had been nearly exterminated, are again becoming numerous, and by the time the present law expires will have recovered from the effects of over-hunting. This is the case not in one or two localities only, but all over the Province, and districts once celebrated as favorite haunts of the moose promise to become as good hunting-grounds as ever they were. While the people, as the report says, are becoming more accustomed to the law, and more ready to acknowledge the wisdom of its provisions, and the necessity for its enactment, measures will nevertheless have to be devised to prevent the wholesale slaughter of the moose after the present prohibitory law expires, as all the good done during the three years close time may be speedily undone. Some restrictions will have to be placed on the number of animals killed by any hunting party, and these restrictions will have to be enforced as strictly as the actual law. There are now 38 wardens to enforce the law, and the Government pays the cost of prosecution when the offenders are too poor to pay. The reluctance of witnesses to give evidence in court is a serious obstacle to prosecution for offenses.

—At the meeting of the Livingstoo Sportsmen's Club, held Monday night, a letter was read from Henry Knapp, who has been engaged by the club to secure birds for the State shoot, stating that he was in Buffalo waiting for the flying birds to settle, that they would probably settle either in Michigan or Pennsylvania, and as soon as there was any prospect of their settling he should start and commence work. The time for holding the State shoot cannot be announced until the birds have been secured. One week's notice will be sufficient, however, as all the preparations will have been made.—*Syracuse Standard.*

San Francisco, Cal., March 30th, 1876.

Editor Forest and Stream:—

I have the pleasure to inform you that a sporting club is about being formed here, chiefly for the protection of our game, but also for the purpose of affording its members all proper, legitimate, and good facilities for the enjoyment of sport with the gun and rod. I have but little doubt that 100 to 150 persons will soon be found who will unite to form an effective association, and by paying twenty dollars each for membership and one dollar monthly, will raise a fund to carry out its purposes, one of which will be to improve a house and premises already in existence close to Lake Merced, and near the ocean, only about six miles from the heart of the city. There they will have rooms and sleeping berths, sheds and stabling for vehicles and horses, and a boat house on the shore of the lake, conveniently situated for their use in fishing, etc. There will be no bar-room, but the members will carry their own provisions and what beverages they may desire. Of course they will have a custodian of the house and boats, etc., and probably a cook. Lake Merced is already well stocked with salmon and Lake Tahoe trout. It is a noble piece of water, well sheltered by hills, on the ocean side mostly, and is about two and a half miles in length by about half a mile wide. It may be said, indeed, to be two lakes connected by a narrow shallow small strait or passage, at one end nearest the sea, at which place and from which it is separated only by a high hill or large sand embankment. Along most of the sides of the lake, near its shores, there is a species of reed which affords good refuge and shelter for the fish, and near to which most of them are captured, either by bait fishing or trolling from a boat with a spoon bait. The baits chiefly used are raw or boiled shrimps, mussels, and sometimes the earth worm and small fish. The spoon bait is a flashing twirl of gold on one side and silver on the other, with a triangle of small hooks. Sometimes for a while one made of these kinds of fishing is successful, and sometimes the other. Last year a large number of both silver salmon and Lake Tahoe or Truckee River trout were captured. The lake is replenished annually with these two sorts of fish, and this year we anticipate even better sport than we had last. The trout run generally larger in size than the salmon. They have no access to the ocean, and the water of the lake is entirely fresh. Salmon in fresh water will not attain to a great weight, but we are contented to have them in such water even only of a moderate size. Our acclimatizing society had leased the lake for the purposes of their angling, but we expect they will amalgamate with the new club about to be formed, to the mutual advantages of both societies. All, at present, is rather in an embryo state, and I cannot give you all the particulars of this new move, but may soon be enabled to send you a fuller and more explicit account of our arrangements and proceedings.

E. J. Hooper.

Elks for Blooming Grove Park.—A pair of live California elks (*wapiti*) were turned into the breeding-park at Blooming Grove last week. They were captured in the northwestern corner of Iowa, and arrived in good condition, via., Dunkirk and Erie Railway to Laxawaxen, from which place they were led by men fourteen miles to the Park. Mr. Luppelman, of Fremont, Ohio, their former owner, writes as follows to John Avery, Esq., President of the Association:—

"In answer to your inquiries regarding elks. They are dangerous in October to strangers, but to their keeper seemed always gentle; still it would be advisable to be careful at that season of the year. A fence five feet high will keep them safely inclosed; I do not think there is any danger of their jumping out. The cow bears but one calf at a birth; the one sent will calve in June. It is necessary to let them have access to water; they are very fond of wading, and plunging about to rid themselves of flies during the summer, and the larger the range of ground they have the better for them. I have another pair I would dispose of as my park is too limited in space for the number I have. Since I shipped to you, I lost a fine yearling cow. I think want of ranging room caused her death. Their food is any thing that a cow will eat."

—We take pleasure in announcing that Mr. Wakeman Holberton, so long known as a good sportsman and artist, has secured an interest in the Sportsman's Emporium, No. 102 Nassau street, formerly Eaton & Co., and now Eaton, Holberton & Co. The business will hereafter receive his whole attention, and be under his management, aided by Mr. Geo. B. Eaton. Mr. Holberton has long been known as a skillful fly-fisherman for black bass and speckled trout, and after an experience of many years in shooting and angling feels that he knows what sportsmen require. He is an expert in fly tying, and in that line has no superior. For a number of years he was in the employ of the celebrated gun firm of W. J. Syms & Brothers, and has a thorough knowledge of guns, pistols, and everything connected therewith. The new firm will, as before, continue to supply everything necessary to the complete outfit of sportsmen, both for the camp and field, and at the same time give more care and attention to guns, rifles, and fishing tackle. We hope all sportsmen will give them a call at their quarters, 102 Nassau street, to which they have returned.

The Rifle.

THE INTERNATIONAL MATCHES.

Now that the organization of an Imperial British team, under the leadership of Sir Henry Halford, has been definitely abandoned, some of the small bore experts of England are turning their attention towards the possibility or advisability of organizing an independent team on the plan of the Scotch and Irish. To be sure, the letter of Mr. Wells, Captain of the English Eight, to the *Volunteer Service Gazette*, does not look very favorable toward such a consummation, for he says:—

"I do not think, even if there were in the present case no special reasons against it, that any other country than our own is the fittest place for deciding the rifle superiority of any territorial divisions of our common country, be they those of England, Ireland, and Scotland, or of any of their respective counties.

But apart from this consideration, I should say that, owing possibly to a misunderstanding as to the nature of the invitation from America, the teams that will go from England and Scotland, and to some extent, I believe, from Ireland, though of this I am not so sure, would not represent the real shooting strength of these countries."

To which he adds: "It is, I believe, notorious, that some of the best shots in Scotland are not to join the team which is to visit America." Now, unless we are sadly misinformed, Mr. Wells is not only in error, but he will find numbers who are ready to join issue with him on this point. In fact, his remarks bear on their face the evidence of an effort to belittle any match which may be shot in this country, whether it may result in victory for the Scotch, Irish, or ourselves. Our English contemporary mentioned above takes a very just and sensible view of the case, and considers that it would be an over-strained scrupulousness for the English riflemen to stand longer aloof. He says:—

"Such a course is certain to be misconstrued by the Americans, and is, in fact, an implied censure on the Irish riflemen, who behaved with perfect loyalty to the "United" scheme, until it was defeated by the action of the Scotch."

To say that the Irish, who have two defeats to wipe out, would not send their best shots, is simply absurd. We have all along contended, and do so still, that the presence of a British or Imperial team would add greatly to the interest of the international matches; but since, through the course of our own National Association in making the invitations general, that cannot be, we would most heartily welcome an English team to compete with their Scotch and Irish brethren against their American cousins, or against all comers, for the rifle championship of the world. And we trust that among the small bore shots of England—and their name is legion—there will yet be found a team who are willing to cut their leading strings and act independent of those whose greatest opposition to their going lies in the fact of their being unable to have everything arranged strictly according to their own views.

INTERNATIONAL RIFLE MATCHES.—The joint committee of the National Rifle Association and Amateur Rifle Club held a meeting on Friday, Gen. M. T. McMahon in the chair. The members present were Inspector General Woodward, Gen. Knox, Major Holland, Major Jewell, Judge Stanton, Robert Johnson, and G. S. Schermerhorn. Judge Stanton, in behalf of the Committee on Finance, reported that he had received a subscription of $2,500 from Messrs. Poppenhusen Bros., and had their assurance that ample facilities would be provided for the transportation of people to Creedmoor during the international matches. The time-table during the meeting would, he said, be made up in accordance with the wishes of the joint committee. On motion of Gen. Knox, the Treasurer was directed not to disburse any of the funds belonging to the committee without an order from the Finance Committee. On motion, it was decided to invite Gen. Shafter, President of the National Rifle Association, and Col. Mitchell, President of the Amateur Rifle Club, to participate in the meetings of the joint committee hereafter. The meeting then adjourned.

CREEDMOOR.—One of the leading matches on this range last season was that for the bull's-eye badge presented by George Crouch, Esq. The trophy having been finally won by Mr. Leonard Geiger, that gentleman has in turn presented to the Amateur Rifle Club a trophy to take its place. The present medal is a gold coin of the value of fifty dollars, suitably mounted, and is shot for under somewhat peculiar conditions, which will probably be modified ere long. These are—20 shots at 1,000 yards, 15 at 900, and 10 at 800, commencing at the long range. The weather during the forenoon was fine, but in the afternoon the wind varied between southeast and southwest, blowing half a gale. The scores therefore, are not first class, considering the the previous records of most of the contestants. Maj. Fultou was the winner with 18 bull's-eyes, although Mr. Ballard beat him on the total score. Mr. Geiger, although declining to compete for the badge presented by himself, shot with the others, and made the top score, viz.: 19 bull's-eyes and 176 out of a possible 225. The scores made by the competitors were as follows:—

Names.	800 yards.	900 yards.	1,000 yards.	total.	Bulls-eyes.
Maj. Henry Fulton	38	62	59	159	18
L. M. Ballard	44	52	68	164	17
G. W. Yale	38	62	59	159	15
J. L. Allen	35	59	57	151	14
W. B. Farwell	43	57	50	150	14
A. Anderson	34	49	56	139	14
R. Rathbone	44	51	49	144	14
W. S. Elmendorf	48	53	43	144	13
L. Webber	46	46	44	136	12
N. Washburne	50	38	39	127	10
H. Fisher	43	46	40	109	9
E. H. Raymond	43	41	34	122	8
S. G. Perry	40	44	41	133	7
F. Hyde	40	51	37	148	7
A. J. Mennion, Jr.	46	34	25	95	4
Col. C. McNab	15	21	31	67	2

CREEDMOOR, JR.—The return match between the teams representing respectively the New York Life and the Continental Fire Insurance Companies, was shot at this range on Saturday, and won by the first mentioned. The scores were as follows:—

NEW YORK LIFE. Name.	Total.	CONTINENTAL FIRE. Name.	Total.
H. C. Harrison	43	W. Ellsworth	42
L. Fosdick	4[illegible]	G. Hope	4[illegible]
L. Darnee, Jr.	41	R. L. Roberts	40
C. W. Pontez	4[illegible]	A. E. Earnest	3[illegible]
J. S. Conover	30	W. Townsend	31
Total	201	Total	191

CONLIN'S GALLERY.—The St. John's Guild Rifle Tournament, given at this gallery in aid of the Floating Hospital for the poor, sick children, is an immense success, and will realize a liberal sum for its object. About one hundred competitors have entered. It is respectfully announced that this contest will positively close on Saturday night, April 29th, 1876. All comers are invited.

HELLWIG'S GALLERY.—The prize shooting held at Hellwig's Gallery, 271 and 273 Eighth avenue, ended Thursday April 19th. The first prize, a flue rifle, was won by Fred Kessler, the second, a cap rifle, by M. B. Engel, and the third prize, a parlor pistol, by R. C. Wheeler.

—The Rod and Rifle Club of Jamaica, L. I., are making extensive preparations for the coming season. A few days since Mr. Creed, President of the club, showed us two handsome and appropriate medals gotten up by Messrs. Schuyler, Hartley & Graham, one to be known as the Champion badge, and to be competed for on the third Wednesday of May and the second Wednesdays of June, July, August, September, and October, becoming the property of the member who shall have won it three times. The other is to be known as the Challenge badge, and is to be shot for on Saturday of each week, commencing May 6th and ending October 28th, becoming the property of the member who shall have won it the greatest number of times during the season. The club now has two 200-yard targets on their range, one being found insufficient for the number of contestants in the matches.

MORSEMERE.—The Yonkers Rifle Association are about organizing an off-hand, short-range team to represent it at Creedmoor and elsewhere. With such good material to select from the team should be a remarkably strong one. In the meantime it is a pity that the long-talked-of match between this association and the American Rifle Association cannot be brought to an issue.

The spring meeting of the Yonkers Association will take place on Friday and Saturday, April 28th and 29th. The programme is as follows:—

MATCH I—*Man Target Match.*—Distance, 200 yards; time, 5 seconds per shot; position, standing; weapon, any rifle; rounds, five; no sighting shots. Entrance fee, twenty-five cents. Re-entries allowed.

This match to be open during the entire meeting. First and second purses will be awarded to the highest scores at the end of each day. Entries close at 5 P. M.

MATCH II—*Short Range Match.*—Distance, 200 yards; position, standing; weapon, any rifle; rounds, ten; no sighting shots. Entrance fee, fifty cents. Re-entries allowed. Prize, a nickel plated revolver. Match to be open during the entire meeting. Entries close at 5 P. M.

MATCH III—*Team Match. Special Target.*—Open to teams of five from any rifle club. Distance, 500 yards. In addition to the 22-inch bull's-eye, there will be an 11-inch carton, which will count six points. Position, any; weapon, any rifle; rounds, ten; two sighting shots. Entrance fee, one dollar per man. Each club may send as many teams as they choose. Prize, a lemon glass. The winning team will compete among themselves after the spring meeting for the ownership of the glass. Match opens at 10:30 A. M. Entries close at 11., Friday, April 28th.

MATCH IV—*Carton Match.*—Distance, 500 yards; position, any; weapon, any rifle; rounds, five; two sighting shots; bull's-eye 12 inches. Entrance fee, fifty cents. First and second prizes, the winning cartons suitably inscribed. Open at 2 P. M. Entries close 5 P. M., Friday, April 28th. Re-entries allowed.

MATCH V—*Mid-Range Match.*—Distance, 500 yards; position, any; weapon, any rifle; rounds, seven; no sighting shots. Entrance fee, fifty cents. Prize, a field glass. Open at 10 A. M. Entries close at 12 M., Saturday, April 29th.

MATCH VI—*Individual Match.*—Distance, 500 yards; 11-inch carton; position, any; weapon any rifle; rounds, ten; two sighting shots. Entrance fee, $1. Prize, a Creedmoor cartridge box. Open at 2 P. M. Entries close at 5 P. M., Saturday, April 29th.

All entries to be made with the score keepers on the range.

The matches are open to all comers, and shooting will begin each day at 10 A. M. The Amateur Rifle Club have announced their intention of sending a team to compete in Match III, and many of the celebrated shots will compete. The attendance should be large.

On Saturday last the following scores were made in a team match at 500 yards, 40 shots per man: The target was regulation size in every particular, the bull's-eye being 22 in. in diameter, but inside of it was an 11-inch carton, which has one-fourth the area of the old bull's-eye, and for hitting this an extra point was counted. We give the count both by Creedmoor and Morsemere. It will be seen that the Shonnard team wins by 10 points, Creedmoor, and 14 points Morsemere:—

NEW YORK STATE.—The Board of Directors of the Ninth Division Rifle Association, whose headquarters are at Syracuse, have announced their programme of this spring meeting, although the dates on which the matches are to be shot have not yet been fixed. The programme is as follows:—

I. DIRECTOR'S MATCH.—Open to Directors of the Sixth Division Rifle Association.

II. SIXTH DIV. N. G. MATCH.—Open to teams of twelve from each regiment, battalion, or separate company of infantry in the Sixth Division.

III. REGIMENTAL MATCHES.—Open to teams from different companies or to individuals of the regiment or company, according to the discretion of the donors of prizes.

IV. CAVALRY MATCH.—Open to teams of five from any troop of cavalry in the Sixth Division.

V. SPORT RANGE MATCH.—Open to all comers; distance, 200 yards.

VI. LONG RANGE MATCH.—Open to all comers; distance, 800 and 1,000 yards.

VII. MID-RANGE MATCH.—Open to all comers; distance, 500, 600, and 700 yards. Handicap match.

VIII. OFFICERS' MATCH.—Open to all general, field, staff, and line officers; distance, 200 yards.

IX. CONSOLATION MATCH.—Open to members of the Sixth Division and competitors in the foregoing matches who have not won a first, second, or third prize; distance, 500 yards.

A team of three from the Amateur Rifle Club, of Rochester, shot on the 21st, at Geneva, three matches with an equal team from the Geneva Rifle Club. Distance, 800 and 150 yards. At the longer range the position was any allowed by Creedmoor rules by the Rochester men; muzzle rest allowed to Geneva. The Rochester men used Remington rifles of ten pounds weight. Gaylord, of Geneva, used a thirty-two pound muzzle loader, with rest; Miller, a twenty-one pound muzzle loader in the same way, while Smith used a Sharps Creedmoor without rest. The wind blew fresh directly across the line of fire, making necessary an allowance of eight or ten feet for the wind, in spite of which the scores were satisfactory for amateurs. It will be seen that Rochester won by eight and fourteen points:—

FIRST MATCH—800 YARDS.

GENEVA. Name.	Total.	ROCHESTER. Name.	Total.
Smith	39	Rider	45
Gaylord	45	Hart	43
Miller	39	Stillson	43
Total	123	Total	131

SECOND MATCH—800 YARDS.

GENEVA. Name.	Total.	ROCHESTER. Name.	Total.
Smith	36	Rider	48
Gaylord	36	Hart	39
Miller	33	Stillson	32
Total	105	Total	119

At 150 yards the shooting was off-hand, and the Rochester riflemen held their own against their doughty opponents, but not with so much advantage as at the longer range. Fifteen shots were fired by each man, with the following aggregate out of a possible seventy-five:—

150 YARDS—OFF-HAND.

ROCHESTER. Name.	Total.	GENEVA. Name.	Total.
Rider	61	Smith	60
Hart	58	Miller	57
Stillson	57	Gaylord	56
Total	174	Total	173

After the above, an off-hand match was shot between Mr. Smith, President of the Geneva Club and the President of the Rochesters, ending in a victory for the former by a score of 64 to 58.

It is but fair to state that Gaylord's piece of artillery broke down after the sixth round of the second long range match, after which he used the smaller muzzle-loader of Miller, but the matches have demonstrated that we need no longer fear the muzzle-loader in long range shooting.

MASSACHUSETTS.—The members of the Massachusetts Rifle Association held their third prize meeting of the season at the Spy Pond Range on the 18th inst., the conditions being fifteen shots each at 200 yards, the contestants being divided into three classes in accordance with their previous standing of scoring. In the first class the prize was won by J. B. Osborn, second by W. H. Jackson, and third by J. N. Frye. In the second class E. B. Souther took the first prize, C. E. Hebbard second, and J. F. Wheeler third. In the third class the honors were conferred on J. L. Stevenson, W. F. Symms, and E. W. Johnson, respectively.

The following is the score made by each individual by both the Creedmoor and Massachusetts methods of reckoning, the first figure representing the former method and the second figure the latter:—

First Class—J. B. Osborn, 158–69; W. H. Jackson, 146–64; C. E. Sanborn, 145–65; J. N. Frye, 145–65; S. C. Noyes, 144–65; S. C. Ring, 144–62; J. N. Frost, 142–63; W. Gerrish, 132–61; C. C. Wemyss, 142–63; J. W. Wemyss, 134–62; A. P. Clark. 132–61; S. Plummer, 124–51. Second class—E. B. Souther, 141–68; C. E. Hebbard, 141–60; J. F. Wheeler, 138–63; G. H. Adams, 134–62; E. Lawrence, 133–61; J. N. Brown, 127–56. Third class—J. L. Stevenson, 139–63; W. F. Symms, 135–60; C. A. Parker, 108–53; E. B. Hull, 108–54; E. W. Johnson, 111–56; H. S. Harris, 107–59; W. E. Gerrier, 100–51.

At the close of the shoot, Mr. Gerrier having made the lowest score, he was awarded a small toy gun by a member of the association, which he took amid shouts of applause. It was announced that Major Henry Fulton had presented a Remington rifle, Creedmoor pattern, to the association, to be contended for by the members under such conditions as the directors may decide.

PENNSYLVANIA.—The first annual meeting of the Scranton Rifle Club will be held on Wednesday and Thursday, May 24th and 25th, when one hundred dollars in prizes will be shot for. The officers of the club are John Nichols, President; J. N. Gardner, Secretary, and Enoch Page, Treasurer.

NEW ORLEANS.—The New Orleans Rifle Club had a lovely day for target practice on the 16th inst. The wind was rather strong, still there were some very fine scores made. The members were out in full force. The following are the leading score:—

Centennial Target, 25 half inch rings, off-hand.

Name.	Total.	Name.	Total.
A. Wattenhoffer	155	E. J. Weock	151
M. Winteler	153	Jules Pifiant	149

Wimbledon, off-hand, out of a possible 50.

A team calling themselves the Unknown have issued a challenge to shoot a match with a team from any other club in the State of Louisiana, at 1,000 yards. As there is no other club in the State that has a longer range than 200 yards, we of course expect lively times. GUSSIE.

MILWAUKEE RIFLE CLUB.

MILWAUKEE, April 18th, 1876.

EDITOR FOREST AND STREAM:—

The first competition for the Brodhead field glass prize, at 500 yards came off several days ago. C. D. Turner made 72 out of possible 75, and wins the glass once. The second competition for the 200 yards prize, came off last Friday the 14th inst. J. M. Arnold made 42 out of possible 50, and wins the glass once. Score at 200 yards; 10 shots off-hand:—

Name.	Total.	Name.	Total.
J. M. Arnold	42	C. Turner	37
E. Fielding	41	C. Shoonds	32
John C. Wells	41	D. Frankenberger	31
John Mennier	41		

Off-hand shooting, according to the Milwaukee Rifle Club rules, means: Stand up on your feet like a little man, pull down your vest, keep the whole of the left hand forward of the trigger guard, and both arms free from the body, excepting where they hinge on the shoulder.

WAN WAN.

CALIFORNIA.—Capt. H. J. Burns and Mr. Philo Jacoby, two expert rifle shots of San Francisco, recently shot an interesting match at Buena Vista Park, the conditions being twenty shots each at 200 yards off hand at a Creedmoor target, the hits to be measured, however, instead of counted in the usual way. The match was brought about because Mr. Jacoby believed that the Creedmoor target did

not give sufficient credit to the superior marksmen; but these who witnessed the match were convinced that, for simplicity and economy in time, the present Creedmoor, or rather Wimbledon plan, was much superior to the old system of string measurement. At the expiration of the twenty shots it was found that Capt. Burns' string measured 130 5 16 inches against 185 15-16 inches of Mr. Jacoby.

Gen. Batterman, of Virginia City, Nevada, has offered to match five men against any five men of the Second California Brigade, and a match will probably be made.

Game Bag and Gun.

MAY IS A CLOSE MONTH FOR GAME.

GAME IN MARKET.—English snipe are unusually plenty, selling from $1.50 to $2 per dozen, principally Western birds, however, an indication, taken in connection with the scarcity along the coast, that the birds are taking a western flight. Wild pigeons are also very abundant, selling for $1 per dozen. There are still a few ducks in market, selling at last week's prices; the season, however, expires on the 1st proximo.

—We have a letter from Mr. J. W. Kinsey, of Barnegat Inlet, controverting the charge of extortion preferred against himself and the baymen by our correspondent Long, M. D., in our issue of April 13th. Mr. Kinsey hases the discomfiture of the Doctor's party upon their error or misfortune in coming at the wrong time of tide, when the yachts were aground and the birds out of reach. The charges for yacht, etc., were the stated charges of $2.50 per day and "found," which means board for the gunner and ammunition. Mr. Kinsey is inclined to attribute their objections to parsimony rather than sufficient cause. The bayman especially complained of, as he states, was Capt. Joel Ridgeway, whom many of the readers of FOREST AND STREAM know favorably. Moreover, no notification of the coming of the party was received in advance; and Mr. Kinsey gets the laugh on them in the respect that they engaged a yacht at half price, and found to their chagrin that she was only a skiff. The letter is spiey, and on the whole good natured, but it is evident the dislike was mutual all around. As the letter occupies four pages of foolscap, we have no room to print it all.

—The members of the First German New York Hunting Club have resolved to visit the Centennial Fair on the 10th of June next, to meet their fellow sportsmen of the Kensington Hunting Club. At a recent meeting of the club at the club rooms, No. 384 Pearl street, the following officers were elected to serve for the current year: J. Kunz, President; L. Maisch, Vice President, H. Zahn, Treasurer, L. Schuler, Secretary.

NEW BRUNSWICK, *Canada—Chatham, April 21st.*—Wild geese are not very plentiful along the coast lagoons this spring. The fine weather brought them along, but they found their usual feeding grounds covered with ice, and they have gone away again in large numbers. They will doubtless return again before the season is over.

CONNECTICUT—*West Meriden, April 17th.*—We are now having a little snipe shooting here. Two sportsmen bagged nineteen birds near New Haven on the 10th of April, and I have heard of some smaller bags since. VON.

MASSACHUSETTS—*Salem, April 24th.*—Since my last note there have been not more than a dozen snipe shot around Salem. At Newburyport there have been some killed, the best being eight between two guns. The grounds are good, but the season is late, and seems more so each year. Water birds are scarce, only a few loons, sheldrakes, and an occasional gull remaining. TEAL.

MARYLAND—*Snow Hill, April 20th.*—Snipe shooting on our marshes has been remarkably good during the week. Two gentlemen from Philadelphia, Messrs. Zinn and Hope, bagged forty brace in three days, besides other game. MESSENGER.

WISCONSIN—*Montello, April 20th.*—Water fowl are very plentiful in this vicinity, especially the scaup, buffed-heads and red-head ducks, which are abundant upon the waters of Buffalo Lake, and upon the Fox River. However, the ducks are very shy and hard of approach, consequently but few are killed. A few mallards and wood ducks are preparing for nesting in this vicinity, and these two species, as also the teal, are protected by the game laws until September 1st. Wild geese are to be seen in considerable numbers, but I believe none have been shot in this section. Pinnated grouse are as plenty as usual, and the calling of the birds on the low lands sounds cheerily each morning. Snipe are unusually late this season in their northern migration, and but very few have as yet been seen in this section, and it does not appear probable that the *scolopaces* will be found here in sufficient numbers this spring to furnish much sport. Quail and woodcock are rare birds in this section, and are never found in quantities, although southward and along the Mississippi bottoms the birds are reported to be plenty. FRED.

PIGEON MATCHES.

MICHIGAN.—The first public matches of the Adrian Shooting Association were shot at that place on the 14th inst. There were a large number of persons present from Toledo, Monroe, Hudson, and other towns, and brisk competition for the prizes. The following is the score of the first match; five birds each, club conditions:—

Name.	Total.	Name.	Total.
A. P. Fellows	4	W. Aten	5
C. A. Wright	2	T. J. Drake	3
Chas. Wolcott	1	W. Sheparl	0
B. Finney	2	S. H. Perkins	4
L. A. Snow	3	J. C. Crabb	1
A. M. Blair	3	C. S. Salesbury	3
J. H. Snow	1	L. Baker	3
J. F. Clark	3	J. Terpeny	3
J. B. Welch	3		

Welch and Aten divided first money, and Blair and Snow, after shooting off with Fellows and Perkins, the second. In the grand match there were 32 entries. Conditions—10 birds each, 21 yards rise. The following is the score:—

Name.	Total.	Name.	Total.
A. P. Fellows	9	L. A. Snow	6
J. C. Crabb	5	P. McOsker	7
B. Parker	9	L. Baker	4
J. B. Baker	9	C. S. Salsbury	5
W. Weisenger	7	Watt Aten	10
J. Reynolds	8	John Hawley	10
D. M. Blair	8	D. S. Kimball	6
B. A. Finney	6	J. H. Warren	4
J. B. Welch	9	C. Woolcott	6
J. F. Clark	8	Chas. Sickles	7
W. Shepard	9	Jas. Moore	9
John Davidson	7	Z. C. Pheatt	3
J. H. Snow	6	Joe Leonard	9
T. J. Drake	8	S. H. Richards	9
C. A. Wright	8	J. Terpeny	0
S. H. Perkins	0		

The first prize was divided between J. Hawley and Aten. The ties for second money were shot off at 26 yards rise, J. Leonard winning. Clark and Blair divided third prize, and Von Weisenger took fourth.

Detroit, Mich., April 21st.—A contest for the State medal took place at Hauptmann Park on the 21st inst., and was witnessed by a large crowd. The following is the score of the shoot:—

Name.	Total.	Name.	Total.
G. Moran	5	J. E. Long	2
E. H. Gillman	13	C. A. Mack	14
J Camif	12	A. M. M. Van Deuser	3
J. V. D. Eldigo	8	H. Whipple	3
L. Dubois	6		

Twenty-one yards rise, 80 yards boundary, ground traps.

—The pigeon shooting match for the Louisiana State championship, 17 single and 9 double rises, was shot on the 21st inst., and won by J. H. Aekley, who scored 23 to L. C. LeBreton's 29.

ANNUAL SPRING HUNT AT COUNCIL BLUFFS, IOWA.

COUNCIL BLUFFS, April 15th, 1876.

EDITOR FOREST AND STREAM:—

The annual spring hunt of the Council Bluffs Sportsman's Club came off on Friday the 14 h inst. Game has been very scarce all of the season, and was made much more scarce by a heavy snow storm which prevailed all of the day before the hunt. R. Grune and A. C. Graham were chosen captains, and the following members composed the sides:—

CAPT. R. GRUNE'S SIDE.	CAPT. A. C. GRAHAM'S SIDE.
C. H. Babbitt,	L. W. Babbitt,
J. Bersheim,	P. Boman,
S. C. Bowman,	J. W. Chapman,
J. C. Hoffmayr,	R. J. Cory,
John Keller,	H. Heywood,
J. C. Morgan,	B. F. Montgomery,
R. Mulls,	J. W. Morse,
W. Oliver,	Joseph Mass,
Charles Pfefer,	H. C. Nutt,
G. Richardson,	J. T. Oliver,
W. F. Wightman.	Dr. Wall.

Col. Nutt and C. H. Babbitt, were absent from the city and R. J. Cory and W. P. Wightman did not hunt. The following is the score:—Capt. Graham's side, 374; Capt. Grune's side, 250. E. P. A. P.

Rational Pastimes.

BASE BALL.

—The Bostons were badly whipped in Philadelphia on April 24th by the Athletics, on the occasion of their second game together the Blues winning by 20 to 3. A lively ball was used.

—The Hartfords play in Brooklyn on Monday, and in Hartford with the Brooklyns on Friday. On Saturday they go to Boston, playing them also on May 1st.

—The Hartfords had difficulty in defeating the Yale College men at Hartford on April 22: The score at the close of the sixth innings stood at 1 to 0 only in favor of Yale. The final score, however, was 5 to 1 in favor of Hartford. Bond and Knight pitched for the two nines.

—The League Association championship contests were inaugurated at Philadelphia on April 22d, on which occasion the Boston and Athletic Clubs played their first game together this season, the result being the success of the Red Stockings as will be seen by the appended score. Though out-balled by the Athletics the Reds won by superior fielding and base running, two departments of the game which, if well attended to, will always excel the batting feature. A dead ball was played with, and hence hard hitting of a lively rubber ball was not allowed to nullify the effects of skillful play in the field:—

BOSTON.	R	1B	PO	A	E	ATHLETIC.	R	1B	PO	A	E
Wright, s. s	2	1	2	2	0	Force, s. s	0	1	0	4	1
Leonard, 2d b	0	2	0	4	1	Eggler, c. f	0	0	4	1	1
O'Rourke, c. f	1	2	0	0	0	Fisler, 1st b	1	3	14	0	1
Hornung, 1st b	1	2	8	0	0	Meyerle, 2d b	1	1	3	2	1
Schafer, 3d b	1	1	1	6	1	Sutton, 3d b	0	0	0	1	2
McGinley, c	0	0	8	0	3	Coons, c	2	2	1	2	3
Manning, r. f	0	0	4	0	0	Hall, l. f	0	2	1	0	0
Parks, l. f	0	0	3	0	1	Forster, r. f	0	0	3	1	2
Josepus, p	0	0	1	1	1	Knight, p	1	1	1	3	2
Total	6	8	27	7	7	Total	5	10	27	15	13

Boston	0	1	2	0	1	0	0	0	2	—6
Athletic	0	1	0	0	0	3	0	0	1	—5

Runs earned—Athletic, 2; Boston, 1. First base by errors—Athletic, 3; Boston, 6. Umpire—Wm. McLean. Time of game—2:35.

It will be seen that while the Athletics excelled in the batting by 10 base hits to 8, and two earned runs to one, the Bostons had the best fielding score by 7 to 13 in total fielding errors, and 3 to 6 of first base allowed by errors.

—The Brooklyns played the Arlingtons at the Union Grounds on April 22, it being the first game played on that field this season. The Brooklyn professionals won easily by the appended score:—

Mutuals	1	0	0	3	2	0	1	4	0	—11
Arlington	0	0	0	0	0	0	0	0	0	—0

Umpire—Mr. Kenny, of Athletic Club. Time of game—Two hours. First base by errors—Mutuals, 8; Arlington, 0. Runs earned—Mutuals, 0; Arlington, 0.

—On Saturday, April 22d, fully two thousand people surrounded field No. 1 at Prospect Park, the occasion being a practice match between the Nameless and Produce Exchange Clubs, two legitimate amateur clubs. After a well played game the score ended as follows:—

Produce Exchange	2	0	0	2	0	0	0	0	4	
Nameless	2	0	5	0	4	2	0	1	—13	

Umpire—Mr. Ducharme.

—The Chicagos opened play on the 20th of April, and defeated a field nine by 37 to 6, giving them four outs.

—The Bostons won their third game with the New Havens on April 21st, by 9 to 8 only, at New Haven.

—This week the two League championship games will be played in this city, the first being that between the Brooklyn "Red Stockings" and the Bostons, and the second between the former and the Hartford "Dark Blues." The nines will be as follows in the Hartford game:—

BROOKLYN.	POSITION.	HARTFORD.
Hicks	Catcher	Allison.
Mathews	Pitcher	Bond.
Start	First base	Mills.
Craver	Second base	Burdock.
Nichols	Third base	Ferguson.
Hallihan	Short stop	Carey.
Booth	Left field	York.
Haldsworth	Centre field	Remsen.
Treacy	Right field	Higham.

—The Harvard College nine played two good games in April, they defeating the Lowell professionals by 3 to 1, and losing to the Boston Reds by 2 to 0 only. They have a new and effective pitcher in Ernst.

—The Hartfords played the Charter Oaks April 19th, and put in Cummings to pitch, the score being 20 to 1, the Oaks making but three base hits. On the 20th they played the Trinity College nine—a stronger team—and they put in Bond to pitch, and the College players were defeated by 11 to 0, they not scoring a single base hit, Bond put out 7 men, and Allison 14 all from the pitching.

—On Saturday the Bostons play the Hartfords at Boston, and the New Havens play the Brooklyns at New Haven.

—The St. Louis nine had difficulty in escaping defeat at the hands of the co-operative Stocks on Saturday, as the score shows the St. Louis winning by 3 to 1 only. On Wednesday the St. Louis nine played the Red Stocking team, and the Browns had difficulty in winning, score 5 to 3 only. The St. Louis nine will be Clapp, Bradley, McGeary, Bathing, Mack, Cuthbert, Pike, and Blong.

—The Cincinnati Reds began play last week, their opening match being with the Covington Stars, and they won by 7 to 4 only. Gould is Captain of the Reds.

—The Louisvilles had a ten inning game with a strong amateur nine April 20th, winning by 4 to 3 only. Chapman, Hague, Allison, Pearce, Ferguson, and Avery were among the field eleven.

—The following are the latest games played in the professional arena:—

April 25th, Boston vs. Mutual, at Brooklyn	7 to 6
April 25th, Cincinnati vs. St. Louis, at Cincinnati	2 to 1
April 25th, Chicago vs. Louisville, at Louisville	4 to 0

CRICKET.

—The St. George Cricket Club will open at Hoboken on Wednesday next, May 3d. Mr. Giles has brought the field up to quite a high condition, and it never looked as well as it does now.

The Knickerbocker Base Ball Club opened play there on April 24th, their field, too, being in fine condition.

—At a recent competion at throwing a cricket ball entered into at Eton College, England, Mr. Forbes threw a ball the unprecedented distance of 132 yards, or 396 feet. The previous best throw on record was that of E. B. Faucett, 127 yards 1 foot 3 inches. This throw of Mr. Forbes very nearly equals that of John Hatfield of this city, who at a throwing match at the Union grounds, threw a five and a quarter ounce base ball, nine inches in circumference, the distance of 400 feet, or 133 yards and 1 foot, the longest throw of a ball on record in either country. Forbes' throw was aided a little by wind, Hatfield's was made across the wind.

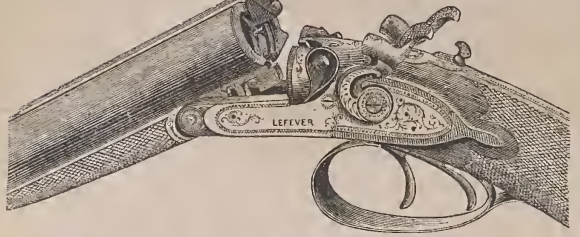
—The Toronto Club has elected the following officers for 1876: President, Lieut-Col. Cumberland; Vice Presidents, Thomas Swinyard, Major Draper, G. W. Yarker, the Mayor; Committee, J. O. Heward, H. Totten, J. L. Gordon, H. C. Sproul, R. Gamble, D. R. Wilkie, F. G. Goslin, W. Hector, J. Martland; Hon. Secretary, W. Pickering; Treasurer, R. H. Belhune. The Secretary's report shows a very favorable state of affairs, with a membership list of nearly 300.

—The Star Base Ball Club of Syracuse, which last year made a good reputation among amateur clubs, has reorganized for 1876 with the following nine:—McGlynn, McCormick, McKinnan, Morril, Maddern, Dorgan, Geer, Croscup, Dunn, and Adams. Most of these are names well known among base ballists, and with such a nine, with manager Brackett at their head, the Stars should be certain of success this season. The Stars will probably make a western tour early in May, and in June will hold a grand tournament at Syracuse.

CHESS.

—The New York tourney closed its fifth week of playing on April 22d, when the score of games played, won, lost, and drawn stand as follows:—

PLAYERS.	GAMES WON.	GAMES LOST.	GAMES DRAWN.
Ainsworth	14	4	4
Ensor	13	4	0
Mackenzie	10	1	1
Mason	10	4	3
Bird	9	4	2
Becker	7	3	2
Richardson	6	5	0
Roser	6	6	0
Brentzinger	5	5	1
Delmar	5	5	0



All others have lost more than they have won, as the score below shows:—

PLAYERS.	GAMES LOST.	GAMES WON.
Hind	10	0
"Smith"	10	3
Parnell	9	2
Perrin	9	2
Baird	8	1
Dell	7	1

LIST OF SKELETONS, Etc. By Dr. H. C. Yarrow.

Dr. H. C. Yarrow, Naturalist of Wheeler's Survey, has prepared for distribution among naturalists and surgeons during the Centennial Exhibition, a list of the skeletons and crania in the Section of Comparative Anatomy of the Army Medical Museum at Washington. The entire museum contains about 24,000 specimens, and the section of comparative anatomy 1,322 specimens belonging to all the classes of the animal kingdom, and collected from various parts of the world. The appropriations for the support of the Museum have been hitherto too limited to permit the expenditure of any considerable sum on the collection of comparative anatomy. The specimens enumerated were for the most part collected by medical and other officers of the army on duty at frontier posts. For the present, any increase of the collection can only be expected from such donations, which will thankfully be received, or from exchanges of duplicate specimens, which, however, as yet are only possible to a very limited extent. This catalogue seems to have been made with great care, and will no doubt serve a valuable purpose as a list of reference.

THE LEFEVER GUN.

Lefever Breech Loaders.

DOUBLE BARREL BREECH LOADING SHOT GUNS AND RIFLES.

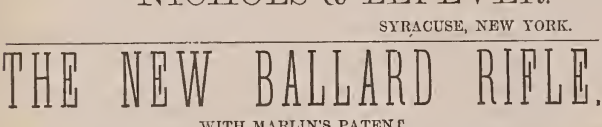
Muzzle Loaders Altered to Breech Loaders.

THESE GUNS ARE CONCEDED TO HAVE THE STRONGEST FASTENING, THE BEST ACTION, TO BE THE BEST HANDLING, AND THE CLOSEST AND HARDEST SHOOTING GUNS BEFORE THE PUBLIC.

We Positively Guarantee Every Gun We Make.

The undersigned having purchased the machinery and tools of the late L. Barher & Co., and added largely to the same, with heavy increase of stock, and with several valuable improvements in the manufacture and action of this celebrated gun, are now prepared to fill orders with dispatch.

For Catalogue and Price List, address



NICHOLS & LEFEVER.

SYRACUSE, NEW YORK.

THE NEW BALLARD RIFLE.

WITH MARLIN'S PATENT

Automatic Extractor and Reversible Firing-pin.

We are beginning to turn out the new rifles, and will be able to fill orders with reasonable promptness. The workmanship will be found superior to any other in the market, and the rifles are warranted in every particular. Sent C. O. D., or on receipt of amount. Regularly organized clubs desiring to test the target rifles can do so by ordering through a party of known responsibility, and agreeing to return in perfect order, freight prepaid, allowing three days for trial.

Price List:

No. 1.—Round barrel, blued frame, 44 cal., rim or centre fire, interchargeable, 26 in., $27.00; 28 in., $28.00; 30 in. $29.00
No. 2.—Octagon barrel, blued frame, rim or centre fire, 32, 38, and 44 cal., 26 in., $29.00; 28 in., $30.50; 30 in. 32.00
No. 3.—Same as No. 2, 22 cal.; 24 in., $30.00; 26 in., $31.50; 28 in., $33.00; 30 in. 34.50
No. 4.—Octagon barrel, extra heavy case-hardened frame, first class in every respect, fully warranted, 38, 40, 44, 45, and 50 cal., 26 in., $32.00; 28 in., $34.00; 30 in., $36.00; 32 in., $38.00; 34 in. 40.00
No. 5.—"Pacific," same as No. 4, double set triggers, cleaning rod under the barrel; 28 in., $40.00, 30 in., 42.00
No. 6.—"Off-Hand," 40 and 44 cal., 30 and 32 inch barrel, hand-made stock, German style, extra fine registering sights, double set triggers 75.00
No. 7.—"Creedmoor A1," to 1,000 yards, 44 cal. to 110 grains, selected hand-made pistol grip stock, finest Vernier and wind gauge sights, with spirit level, sight case, finest finish 103.00
No. 8.—"Creedmoor," same as A1, but not so highly finished 85.00
No. 9.—"Creedmoor," without pistol grip 75.00

THE SPORTSMEN'S ROUTE.

Chicago & Northwestern Railway.

This great corporation now owns and operates over two thousand miles of road, radiating from Chicago, like the fingers in a man's hand, its lines reach in all directions, and cover about all the country north, northwest, and west of Chicago. With one branch it reaches Racine, Kenosha, Milwaukee, and the country north thereof; with another line it pushes through Janesville, Watertown, Oshkosh, Fond du Lac, Green Bay, Escanaba, to Negaunee and Marquette; with another line it passes through Madison, Elroy, and for St. Paul and Minneapolis; branching westward from Elroy, it runs to and through Winona, Owatonna, St. Peter, Mankato, New Ulm, and stops not until Lake Kanaeska, Dakota, is reached; another line starts from Chicago and runs through Elgin and Rockford to Freeport, and, *via* the Illinois Central, reaches Warren, Galina and Dubuque, and the country beyond. Still another line runs almost due westward, and passes through Dixon, Sterling, Fulton, Clinton (Iowa), Cedar Rapids, Marshalltown, Grand Junction, to Council Bluffs and Omaha. This last named is the "GREAT TRANS-CONTINENTAL ROUTE," and the pioneer overland line for Nebraska, Colorado, Utah, Idaho, Montana, Nevada, California, and the Pacific Coast. It runs through the Garden of Illinois and Iowa, and is the safest, shortest, and best route to Omaha, Lincoln, and other points in Nebraska, and for Cheyenne, Denver, Salt Lake City, Virginia City, Carson, Sacramento, San Francisco, and all other points west of the Missouri River.

TO SPORTSMEN:

THIS LINE PRESENTS PECULIAR ADVANTAGES—FOR PRAIRIE CHICKEN, DUCK, GEE-E, AND BRANT SHOOTING. THE IOWA LINE TO-DAY OFFERS MORE FAVORABLE POINTS

than any other road in the country, while for Deer and Bear Hunting, and for Brook Trout, Lake Salmon, Pike, Pickerel, and Bass Fishing a hundred points on the Northern and Northwestern lines of this company will be found unsurpassed by any in the West.

MARVIN HUGHITT, W. H. STENNETT,
Gen. Supt., Chicago. Gen. Pass. Agt., Chicago.

FOR SALE, OR TO LET.

The elegant country residence, WILLOW LAKE, at Locust Valley, near Glen Cove, Long Island.

Suitable for Summer Boarding-House.

The house is 2½ stories, frame, 40 feet front and 33 feet deep, with wide piazza front, rear, and on south end. On first floor are parlors, sitting-room, and dining-room; wide hall through the centre. Up stairs are 9 bed-rooms, and on 3d story, kitchen well-arranged and convenient; cellar large and dry.

On the premises, and at a convenient distance from the house, are a stable and carriage house, chicken-house, shed, coal, tool, and ice houses. The grounds are well laid out and tastefully planted with ornamental trees and shrubbery. The avenue leading from the road to the house skirts a beautiful lake, on the border of which the house stands. A Paper Mill at the north end of the lake will be sold with the above, subject to a lease. The lake and land embrace about 27 acres. As a place of residence it is elegant and healthy; for manufacturers it is convenient; for the propagation of trout, for pleasure or profit, there is no better place in the State. Apply to

BUY IT Vanity Fair.
It is shaved from the best Natural Leaf, for Mecrschaum and Cigarettes. Does not make the tongue sore. Sample on receipt of 30 cents. Highest award, Vienna, 1873. Send for circular.
WM. S. KIMBALL & CO.,
PERFECTION TOBACCO WORKS, Rochester, N. Y.

From Seth Green, Supt. N. Y. State Fisheries.
I find Vanity Fair to be the best article of tobacco adapted to the wants of the sportsman. Have used your tobaccos for many years, and know them all to be first class.

For Sportsmen.
A trusty friend, in weariness or trouble; a solid reasonce in Winter and rough weather, is a sweet pipe with Vanity Frir. Best dealers have it.

From A. B. Lamberton, Rochester.
Having smoked your tobacco, Vanity Fair, by the camp fire and by the hearth, I believe it in point of fragrance and taste superior to all brands known to me. Being in search of a tobacco that would not fire the tongue and mouth, I was made acquainted with your Vanity Fair, and found it to be the *ne plus ultra* of natural leaf.

For Cigarettes.
A cigarette is an interlude to the serious haht; n graceful make-believe for spare hours. For cigarettes Vanity Fair has no equal. Best dealers have it.

From Forest and Stream, N Y.
We have received from Messrs. Kimball & Co., of Rochester, some choice specimens of their celebrated Vanity Fair tobacco in neat metal cases holding a pound each; and, after most thorough trial, do not hesitate to concede to it all the good qualities which its manufacturers claim for it. It is a most superior article, and a great comfort to discriminating smokers.

THE
PAPER STEM PIPE.
Just the Thing for Home and Camp Use.
Supplies a want which smokers have long felt—a pipe which shall give simply the taste and odor of tobacco smoke. This pipe never accumulates rank smelling liquid in stem or bowl, but is always clean and sweet. The bowl and mouthpiece are permanent, but the stem is of porous paper, to be laid aside after a few days' use and a new one fitted. Extra stems accompany each pipe. The price of extra stems, when not furnished with the pipe, is as follows: Four and a half and seven inches, 5c.; twelve inches, 15c. Sold by pipe and cigar dealers generally, or a complete sample sent by mail for $1 by

88 Wall Street, New York.

The Popular Sheridan Lounge, $5 plain; $10 quilted is the standard with sportsmen. Sold at Eaton & Co.'s, 102 Nassau st., and E. S. Harris, 177 Broadway.

Zoological Garden.
FAIRMOUNT PARK, PHILADELPHIA.
Open every day. A large collection of Living Wild Beasts, Birds, and Reptiles. Admission, 25 cents; children under twelve, 10 cents. jan6 1y

Orange Sporting Powder.
ORANGE LIGHTNING POWDER,
The *strongest* and *cleanest* Powder made. Nos. 1 to 7, packed *only* in sealed 1 lb. canisters. The coarser sizes (higher numbers) especially are recommended to owners of fine breech-loading guns, giving great penetration with very slight recoil.
ORANGE DUCKING POWDER,
For water fowl. Very strong and clean. Nos. 1 to 5. Packed in metal kegs of 6¼ lbs. each, and in canisters of 1 and 5 lbs.
ORANGE RIFLE POWDER,
The best for rifles and for all ordinary purposes. Sizes F.g. FF.g, FFF.g, the last being the finest. Packed in wood and metal kegs of 25 lbs., 12½ lbs., and 6¼ lbs., and in canisters of 1 lb. and ¼ lb.
All of the above give high velocities and less recisuum than any other brands made.
BLASTING, MINING, AND SHIPPING POWDER OF ALL GRADES AND SIZES PACKED IN WOOD OR METAL KEGS OF 25 LBS.
SAFETY FUSE AND ELECTRICAL BLASTING APPARATUS.
LAFLIN & RAND POWDER Co.,
21 Park Row, N. Y.
Sole proprietors and manufacturers of the celebrated ORANGE brand of GUNPOWDER. Recommended and used by Capt. A. H. BOGARDUS, the "Champion Wing Shot of the World."

CHALLENGE.
The undersigned is prepared to prove all the superior qualities he claims for his powder.
Safety, Cleanliness, Strength, Little Recoil, Little Smoke, Small Report, Less Heating of the Barrel in Rapid Firing, and its Regularity in Shooting.
He challenges all riflemen to shoot against him with black powder, 200 rounds, without wiping; 100 rounds off-hand, at 200, 500 and 1,000 yards respectively, and 100 rounds in any position at same distances; the 200 rounds equally divided at the three ranges; sighting shots extra.
Will shoot for money if desired.
The powder is also well adapted for shot guns.

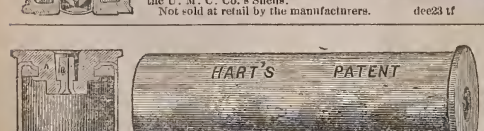
Paper and Metallic Shells
FOR
Breech Loading Shot Guns,

Manufactured by the

UNION METALLIC CARTRIDGE CO.,

BRIDGEPORT, CONN.

THE STURTEVANT SHELLS are the easiest reloaded. Do not have to unscrew the head nor use an awl to remove the exploded caps. THE PATENT MOVABLE ANVILS, made of steel wire, will not bend or break.



THE BERDAN PATENT SHELLS, new model, with Hobbs' patent waterproof primers, never miss fire, and are highly prized by all that have used them.

PAPER SHELLS.—By repeated experiments and great outlay for improved materials, and machinery made expressly for the purpose, we can now warrant our BROWN PAPER SHELLS equal to any imported. They are sure fire, and will not burst in the gun.

Inquire of any of the dealers in sporting materials for the U. M. C. Co.'s Shells.

Not sold at retail by the manufacturers. dec23 tf

Hart's Sportsman's Favorite Metallic Shells for Breech Loading Shot Guns.

These Shells are easily loaded, and the caps easily extracted from inside. Head solid, and much thicker than any shell now made, giving a solid seat for cone or anvil, which prevents it from driving through or springing away, thereby causing misfires. The cone is made of nickle and fastened solid in its place. It neither rusts or corrodes fast like moveable anvil made of steel. The nickle cone also prevents misfire when cap has been left on shell for a few days, which is liable to occur either in steel or iron. These shells are finely finished, and made any length ordered, from 2¼ to 3¼ inches.

Shells and Loaders, and description Price Lists, can be obtained from all the leading sportsmen's houses throughout the country. GEO. E. HART & CO., 363 and 365 Market st., Newark, N. J.

From Captain Bogardus, Champion Wing Shot of America.

MESSRS. GEORGE E. HART & CO.,

Gentlemen—The fifty shells I received from you to-day suit me better than any I have ever used. They are stronger and better in every respect, and I shall use them in all my shooting hereafter. Yours truly,

A. H. BOGARDUS.

may13-1y

CHAMPION GUNS OF ENGLAND
PAPE'S
Unrivalled Sporting Guns.

Stand unequalled in every contest. Their performance at the London Trials of 1875 beats the records of any maker in the world.

1875. 12-Gauge, Choke Boring.

Maker of Gun.	Exhibitor.
1st—Greener	Greener.
2d—Pape	Davidson.
3d—Pape	Pape.

Out of a class of 68 guns, 3 out of the 6 best were made by Pape. The Greener gun was protested against on the spot for having its score false counted, the fact proven there, and afterwards confirmed by same gun being shot for two days per week for six weeks in succession, when its average score only took 24th place, its very best score being greatly below the scores of the best six guns.

1875. 12-Gauge, Old Sporting Bore.

Maker of Gun.	Exhibitor.
1st—Pape	Davidson.
2d—Pape	Davidson.

1875. Long Range, 60 yards, Choke Bores.

1st—Pape	Davidson

60 yards, Long Range, Sporting Boring.

1st—Pape	Davidson

Those champion Long Range guns, only 7 pound weight, with a charge of 3¼ dr. to 1¼ oz. shot, beat the best 8 bore Greener gun at 60 yards; weight, 15 lbs.; 6 drachms and 2¼ oz. shot.

1875. The Sportsman's Sub. Cup, valued at £45, was also awarded to W. R. Pape, for the original invention of choke boring. Winner of the London Gun Trials of 1858, 1859, 1865. Address

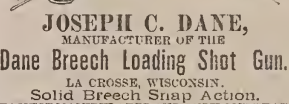
H. C. Squires, No. 1, Courtlandt st. New York.

THE GREAT
London Gun Trial,
1875.

W. W. GREENER'S
Far-Killing Prize Guns.

Winner of Silver Cup, value 40 guineas. Winner in Class 1, for 8 and 10 bores. Winner in Class 4, for 20 bores. Winner in the Wear and Tear Trials, July, 1875. 2,500 shots fired without deterioration.



W. W. G. is the only maker who has made an average pattern of 211 shots in a 30-inch circle, at 40 yards, with a 12-bore gun, at any public trial either in England or America.

I have just received a consignment of these guns, and shall offer to individual sportsmen, for a short time, an opportunity to secure one of these celebrated guns at a popular price, viz: $75, gold; extra for extreme close shooting, $10. This will probably be the last chance to secure one of these guns at these very low figures. All grades and styles in stock or imported to order.

Attention is also called to my stock of guns, by W. & C. Scott & Sons, which includes all their latest improvements. No old style guns in stock.

Sole New York Agent for Holabird's Hunting and Fishing Suits. Trade supplied.

WILLIAMS & POWELL,
Gun and Rifle Manufacturers,

Call the attention of the Sportsmen of America to the extreme SIMPLICITY, STRENGTH and DURABILITY of their New Patent "SIMPLEX" Breech loader and INDEPENDENT EXTRACTOR.

The parts in this new action are so few (only two,) its mechanical soundness so thorough, and the strength and simplicity of the action so great, that W. & P. feel sure it will supercede all the complicated and manifold gripe now in use, its one powerful grip being far stronger than any double, treble or quadruple grip now used. In this new action LEVER and GRIP ARE ONE SOLID PIECE OF STEEL, and the ANGLE of the BODY is left in its ENTIRE STRENGTH.

Drawings of action and extractor will be sent on application, and orders may be forwarded through any of the best houses in the States for execution in the Spring.

Guns guaranteed to make patterns of from 160 to 230 with No. 6 SHOT AT 40 YARDS, as desired.

NO. 25 SOUTH CASTLE STREET,

THE NEW

BOSTON

SHOOTING SUIT,

Manufactured only by

G. W. SIMMONS & SON,

Boston, Mass.

We offer this season an entirely new design of WATER-PROOF SHOOTING SUIT (made from extra quality duck), in the preparation of which we have been assisted by the advice and suggestions of our best resident sportsmen.

The design embraces the best points of the English and French Suits, combined with the necessary requirements for American service. Particular attention has been paid to color.

Each suit is thoroughly water-proofed by a new patent process. The seams and pocket corners being securely fastened, the arm holes ventilated, and nothing neglected to render the suit perfect in every respect.

The price has been fixed at $13, to include Hat or Double Visored Cap, Detachable Haverlock, Coat, Vest, and Pantaloons.

One hundred suits will be kept ready in stock, so that we can furnish to order any size required, at a moment's notice.

In the *Golden Rule* (Rev. W. H. H. Murray's paper) the enthusiastic editor writes:—

"We were shown, the other day, a new water-proof suit, specially adapted for sportsmen, designed and made up by Simmons & Son, of Boston, and to which we call the attention of all brethren of the out-door and shore-shooting fraternity, because it meets the demand of personal comfort and convenience beyond anything of home manufacture seen by us before. As a sportsman, we give it our unqualified endorsement, as combining the best points of the English suits, and in addition skilfully adapted to the necessities of the American service. It is a most admirable and satisfactory contrivance in color, style, water-proof quality and capacity. The coat is a marvel in this latter respect."

Persons ordering from a distance need send only the following to be sure of a perfect fit:—Waist Measure, Height, Breast Measure, Length of Sleeve, Size of Head.

Hunting Wapiti on the Loup.

IN 1870 I closed my business in the East and came West to engage in stock-raising. Being a true lover of the chase, I felt exceedingly anxious to locate in some section abounding in game. I had hunted successfully all the minor game of the East, including deer in Michigan, and on landing at Cheyenne, and seeing the head and antlers of a large elk, I at once decided that my life would never be completely rounded until I became the possessor, by right of my rifle, of the beautiful head and horns of this species of the *Cervidæ*.

Being unable to suit myself in Colorado, taking all things into consideration, I retraced my steps, and finally located here. Elk, at that time, were said to be plentiful. Buffalo could be counted by the thousand, while antelope graced nearly every grassy hillock and undulating divide. I succeeded well in shooting buffalo, but the "prong-horns" gave me many a hard day's jaunt in the saddle, interspersed with creeping and crawling, to find myself reflecting, as I watched them gracefully speeding away: "Thou *wert* so near, and yet so far!" But at last one warm day in August, I caught a fine young buck napping, and rode home triumphant with *Antilocapra Americana* lashed behind my saddle. The spell once broken I had little difficulty, having since killed many of the dark-eyed beauties. But elk, they continually evaded me. Every fall I took trips of two or three hundred miles to find them, but, as often my attempts were baffled for I found nothing but a cold trail made during the summer. Thus time passed on until last fall, October and November, 1875; then taking your editor's advice, I started in my covered wagon, with complete camping outfit for the "Middle Loup," having for a companion Geo. H., who, like myself, was most anxious to kill his first elk. The outfit necessary for pleasant and successful hunting in this country, should have in addition to the usual covered wagon and camping utensils an extra, steady-going saddle horse, accustomed to the picket-rope, and not easily frightened by the use of fire-arms. The clothing should be of heavy woolen material, and of a pale yellowish-brown. The rifle used should be breech-loading, of small bore, heavy charge and light express, or an explosive ball. Such a rifle I find has the main elements which make up a good hunting gun. It gives a flat trajectory up to three hundred yards, the outside hunting range, and is deadly enough for the largest elk. A powerful field glass will be found a most useful accessory.

The Loup is a miniature Platte, (of which it is a tributary) in very many respects, and drains with its branches much of northwestern Nebraska. The upper Middle Loup, where the most of our hunting was done, has the same broad channel and innumerable sand-bars. Its low banks and many islands are densely covered with a thick, tall growth of coarse grass, weeds, and willow brush. The country lying adjacent to this river, and its main branch, the Dismal, is, to say the least, very hilly, being composed of ranges of bluffs lying parallel to the river, and succeeding each other at intervals of one or more miles as far as the eye can reach. The intervening valleys are made up of short, sharp ridges and steep-sided knolls, usually but a few yards apart. Deep canyons from the river, wind out into the various ranges, furnishing timber of several kinds, including cedar, elm, ash, boxelder, and many brush thickets. The first grows in thick dark clumps along the steep sides, and is intermixed with the latter varieties along the level floor-like bottoms of the canyons. Such grasses as are indigenous to the soil, grow sparsely on the up-lands, among which is the famous buffalo or gramme grass. The low-lands furnish a rank growth of "blue-stem," or "blue-joint," every where common in the West.

The game found in this section is "lordly elk," or wapiti (*C. canadensis*), black-tail or mule deer, (*C. Macrotis*), white-tail deer, (*C. Virginianus*), prong-horn antelope, and occasionally a stray buffalo. Musquash, beaver, and otter, are found in nearly all the shallow swift-running streams. Of game birds, there is the sharp-tailed grouse, common pinnated grouse, and, in their season, all the water-fowl common to the West. The elk and black-tail deer range among the highest points of the bluffs; the former in bedding, choose some elevated spur or ridge, while the mule-deer bed in "blow outs" (excavations made by the elements in the loose soil) along the higher ranges, both varieties going some distance for water. The Virginia deer prefer the willow-covered islands, the reedy patches, and the many plum thickets in the immediate vicinity of the river.

On the first day from Kearney Junction, and the sixth from our starting point, we fell in with a settler, on his way home from the railroad, whom we will call Mack, and engaged him to accompany us with his mule team. Just before we reached his ranche Geo. H. shouted me to "come here if you want to see deer." On my way to him I saw not *deer*, but a band of elk; six female with their young, and one "monarch of the glen." Our guns were wrapped up, and before we could get them, the elk mounted a distant hill-side and passed on out of sight. We watched them as long as they were in view, particularly the stag, he being the first we had ever seen. I noticed well his glistening antlers, dark brown mane and legs, and his light smooth sides of gray. Leaving the teams with the settler's boy to be driven to the stables, we took our guns and a shorter route, and while on our way we jumped a large black tail doe from her bed in a "blow-out." She started off with that short stiff-legged bound peculiar to this species, but both of us being excited we missed her.

Heavy fires, a few days before, had run over the country, consuming everything combustible which lay in its way, and for forty miles up Mud Creek Valley there was hardly grass enough on which to picket our teams. On reaching our destination we found that the fire had been there before us, and burned the country for miles with the exception of a few deep canyons. It was late in the day when we arrived and we drove our teams into a steep-sided canyon, dark with cedars growing on the level bed, and up the almost perpendicular sides. Making a huge fire of the dry cedar, we cooked our evening meal of meat and potatoes, which, with good bread, butter, and coffee, we relished thoroughly. Later in the night the wind began to howl, the weather turned quite cold, and not long after drops began to strike the canvas cover of our wagon. Then they came thicker and thicker, and on peering out in the morning, we found it snowing furiously. The storm continued until noon, the wind piling the "beautiful" (?) into drifts two feet deep, and this on the 25th of October. As soon as it abated we took our guns, Mack and I going one way, and Geo. H. on horseback, another. After some difficulty in ascending to the uplands we proceeded to another canyon, which lay three hundred yards or more to the left of our camp. It was covered with grass, tangled thickets, and scattering groves of elm and ash, which had escaped the fire.

The snow flakes were still falling when we reached the bank, and on looking closely over we saw the unmistakable head and ears of a mule deer feeding, and below us nearly two hundred feet. Stopping quickly back out of sight and taking a circuit we entered the canyon without trouble. Mack being no hunter, I took the initiative and succeeded by careful stalking in getting within forty paces of the buck, while he ate at his leisure, nipping the soft green leaves of the wild snow drop which grows here luxuriantly. He had just secured a dainty little mouthful when on raising his head he discovered me with rifle to my shoulder, and that was the last vision, poor fellow, that he ever had, for my Sharp's bullet killed him instantly. Gazalloching him we snaked him over the snow to a place where we could scale the sides of the canyon. Grasping each horn we pulled and tugged, and in a few minutes we reached the top and were soon in camp; which we had hardly reached before H. came galloping in, and nearly offended me by taking no notice of my fine young buck.

But in a few minutes it came out in this wise: "Boys! Harness up the mules for I've killed the biggest buck elk on the range!" The announcement nearly took away our breath. We shook hands and "yelled like the yell of an Iroquois," and came near, like Dickens' two jolly tars, "pommeling each other's heads" in our joy. After the congratulations were over, we went two miles from camp to bring in the dead stag, and on our way H. "fought the battle o'er." He said that he found a herd of seventy-five or more feeding in a deep canyon; creeping within a hundred steps he selected a male with the finest antlers and shot; the herd scampered away, leaving his elk struggling on his side, which soon regained his feet and walked slowly away and laid down, not, however, until H. had put two more balls into him. Thinking him nearly dead, H. approached him, when the elk "rose to explain," and "made for him," in a "manner quite shocking to see." H. said he thought a proper regard for personal safety required instant flight, and so he climbed a steep bank with the agility of a monkey, and from this stand-point, brought him to a full stop with a bullet from his 44 Wesson.

Mack's little mules hauled the huge fellow on the snow, up and over the bluffs to our canyon. That night there was a sight worth seeing in our camp. The deep, steep-sided canyon, dark with its scattering cedars; the white-covered wagons, drawn closely together near at hand; the tent with the camp-fire crackling before the open door, on which was cooking our bountiful supper, the familiar faces of our four-footed friends, the horses and mules, as they contentedly munched their corn close by, casting many a wondering look at the great antlered monarch of the prairies as he lay in the fire light. My black-tailed buck which we had placed beside it for the purpose of comparison, the bright fire shining over all, and on the happy interested countenances of the group as we listened to the recital of the day's adventures and triumphs, the while far above in the narrow opening the stars twinkled and blazed as it seemed for our particular cheer.

The day following I shot two more male deer, and with this exception we, killed nothing else but time, while in that camp. Giving Mack the greater portion of the meat to carry home to his little ones. We broke camp, crossed the main divide between Mud Creek and the Middle Loup, and drove down to the town of New Helena, on the latter stream, one hundred miles from the railroad.

Delphos, Kansas, March 18th, 1876. G. W. B.

[*To be continued in our next*].

SPORTSMEN'S REMINISCENCES.

EDITOR FOREST AND STREAM:—

"Recollections of Old Sportsmen," printed in your issue of the 20th inst., brings up pleasant memories of collegiate days thirty years ago, spent within walking distance of Fresh Pond in Old Cambridge. Although guns and sporting implements were tabooed in the college buildings, still a few enthusiastic youths dared the penalties and smuggled their guns and game into their rooms under the eyes and noses of investigating proctors. With my first gun, procured from "Poco," the Jew peddlar, at a great sacrifice of wearing apparel, I made one shot at a bevy of quail near the ice-houses at Fresh Pond. It was also the last with that gun; for although I secured a bird the gun went to pieces as suddenly as the deacon's shay.

A former Solicitor of the Treasury and a distinguished member of the New York bar, were my frequent companions on Saturday forays about the wooded shores of Fresh Pond and on the marshes, and many blue herons, teal ducks, rabbits, quails, and partridges graced the board at the evening sessions of the "jolly friars," cooked to a turn, suspended from the ancient mantels before the glowing grate. On one memorable occasion when with a descendant of the Wyth family, on a walk home we crossed Alewife Brook, out on the marshes we descried two strange birds of the heron species. Having brought no gun, one watched the strange visitors while the other ran to "Whit's" well-known resort, celebrated in winter for "flies," and soon returned with a duck gun ready loaded. Cautiously he approached the birds on the open marsh, and to our surprise they did not appear alarmed. When within shooting distance one rose, but the other received a shot and was soon secured. It was a splendid bird, with long curved bill, unlike anything we had seen. Carefully smoothing its brilliant purple feathers, we bore it home. It was presented to the Natural History Society, and declared

to be the glossy ibis, and had probably traveled from Texas to Massachusetts. I believe it is rarely found north of Louisiana.

In those days pickerel were plenty in the pond, and Alewife Brook was sometimes swarming with fish. Longer excursions brought us to the Charles River at Waltham, where wood-ducks, mink, and muskrats were plenty, and on Prospect Hill we often ran foxes with Crehore's hounds, or shot partridges and woodcock with Sam Ladd.

For Forest and Stream.

TROUTING IN THE EASTERN TOWNSHIPS.

THE section of the Province of Quebec known as the Eastern Townships is directly north of the northern boundary line of the State of Vermont. The character of the district is varied, some parts of it being under a high state of cultivation, and other portions a mountainous wilderness, with numerous small lakes and streams, whose waters were once teeming with *Salmo fontinalis;* and in most of the lakes several varieties of the lake trout, or "lunge," were also found in large numbers. But alas! times are not now as they were. A few years ago some stupid blockheads put pike or pickerel into some of the best trout lakes, where they have destroyed the speckled trout, and in many of the other waters the pot hunters, with their netting and spearing during the spawning season, have sadly lessened the number. The townships now, like a middle-aged coquette, though shorn of many former glories, still offer alluring attractions to the sportsman, more especially perhaps to that class of sportsmen who love to ramble amid magnificent scenery, and do not care for making large catches if they are to be had only by roughing it in camping out, though to fish all the township waters it would be necessary to camp out for a week or two occasionally.

For the benefit of your readers, I will give a brief description of the principal lakes in this delightful country and the routes to reach them.

The visitor should make his headquarters in either of the villages of Waterloo or Magog, or in the little city of Sherbrooke, where he will find good hotels, with moderate charges—$1 or $1.25 per day. Waterloo is situated near a small lake bearing the same name, and is the present terminus of the Sheffard and Chamby Railroad, which runs from Montreal. The train leaves Montreal at 2:45 P. M., and arrives in Waterloo at seven o'clock that evening. At the station you will find a free "bus" for the Brooks Hotel, where you will get good accommodations at $1.25 per day. Waterloo boasts a "Piscatorial Club," whose members, Messrs. Geo. Allan, Walt Taylor, Nutting, Skinner, and others, are a set of genial gentlemen, ever ready to give any information and assistance that a stranger sportsman visiting there may require. Should you have a fancy for pickerel fishing you can get your surfeit of it in the lake near the hotel, or drive over to Broome Lake, a fine body of water seven miles from Waterloo. This lake is famous for its black bass fishing, and for an abundance of fish called "shad waiters." At the south end of the lake, near the village of Knowlton, large quantities of pike are caught. If you have no desire for such tame sport, and wish to try your hand with the *Salmo fontinalis*, get a rig from "Herbert's" and take Walt Taylor, or some other member of the club with you, and take a tour among the streams and lakes east towards Magog. Put your rod together first some four miles out from the village, and try the railroad pool; fish there and in the brook through the Beaver meadow carefully, and you will be able to count a goodly number of fine brook trout, not large in size, 'tis true, but very pretty, sweet flavored, and toothsome if properly cooked. Should you be badly taken with a fancy for brook fishing, you drive on a short distance, and there leave your team and follow down the brook for miles through the alders, over a good woodcock ground. You perhaps will not get an overabundance of trout in your trip down through those alders, but you will quite likely bring back with you several broken tips, innumerable rents, scratches, mosquito bites, etc., etc., all well plastered over with Canada muck and clay. In return for these favors, you have left behind along the brook a score or so of your best flies, and have dam'd that stream in many places.

N. B.—The fish commissioner need not make a note of this regarding the aforesaid dams, for they will not obstruct the currents of the tranquil stream in the least.

If you still have a fancy for brook fishing, there are several other equally interesting streams in that vicinity. Some four miles farther you come to Grass Pond, which, however is full of pickerel; but a short distance from the pond, in its outlet, the water tumbles over a little fall into a deep pool, where large trout are sometimes caught. I will never forget the unceremonious manner in which the first trout that I ever saw caught there was ejected from his place of abode. It was thus:—Friend E. B. H., who prides himself on killing his fish with the finest of tackle, and in the most scientific manner, approached the pool noiselessly and made a beautiful cast out over it. Lightly and gently the feathery deception floated down through the air, and had hardly touched the water when a large trout took it with a big rush and swirl, which so astonished H. that he struck violently, and threw the equally astonished fish clean over his head into the bushes behind where he stood. When poor H. recovered his wits he examined his light rod, and stammered out that it was a mistake, and that he wasn't often taken that way. Four miles farther, by the same road, brings you to a mill pond, where H. and myself have killed some fine two and a half pound trout. A farther drive of three miles brings you to Mrs. Peasley's farm house, where you put up your team, and, taking young Peasley for guide, tramp a mile through the woods to Lake Nick, a pretty sheet of water, which measures about a mile in length to half that distance in breadth. The "moss backed" *Salmo fontinalis* are taken here, weighing from one-half to four pounds. They are caught over a weedy bottom in four or five feet of water. Some two hundred yards north of this lake is Mud Pond, which is about one-quarter of a mile in diameter, and contains small trout. Five or six miles south from Mrs. Peasley's, and about the same distance from Knowlton village, is Coon's Pond, a beautiful little body of water near the top of Bolton Mountain, and contains a rare variety of the *Salmo fontinalis*, known there as the "forked tailed speckled trout." They are a slim-formed, silver-colored trout, with the usual red spots on their sides, and will average about a half pound each. They take the fly well, and are a remarkably gamy little fish, and give as much play as ordinary trout of three times their size.

Fifteen miles east from Waterloo, and six miles west of Magog, is Orford Lake, a very beautiful body of water lying along the southwestern base of Mt. Orford. This lake contains the silver lunge, from two to five pounds in weight. One mile south of this lake is a smaller body of water called Hopp's Pond, so named after an old bear trapper who lives near it. The old man says that he has caught "heighty-five bar, hand 'opes to live hand catch fifteen more, so has to make hont the heven 'undred." In this pond there are some large speckled beauties, that kick the beam at four pounds and over. One mile and a half south is Brown's, or Mulligan's, Pond. Trappers report that they have seen in this pond during the autumn large numbers of trout on their spawning beds, but the few fly fishers who visit this pond invariably report poor success. South from this is a chain of small lakes but little visited, as most of them contain pickerel. A pleasant drive of ten or twelve miles north from Waterloo, past several trout streams, brings you to Black River, where "Ash Hubbard," the proprietor of the Parks House, Magog, killed a *Salmo fontinalis* that scored six and a half pounds. About twenty-four miles northeast from Waterloo, by a fair wagon road, is Brompton Lake, a beautiful sheet of water, seven miles long by three in width. This lake is near the centre of a group of lakes, fourteen or fifteen in number. All of these lakes contain some variety of the salmo family. To visit all of these waters the sportsman will find it necessary to camp out for a week or more.

The boat that you will need for the trip you can borrow from some member of the Waterloo club; also get a permit to occupy their house at Lake Brompton. Your other supplies you can procure at the hotel, and from one of the stores near by, excepting your liquors, which you should order from some reliable importing house in Montreal. Load your boat on a double wagon, and pack your supplies and traps into it, and you are ready to travel. After a drive of fifteen miles you arrive at Long Lake, which is four miles long by one-fourth of a mile in width. The water in this lake is clear and cold, and contains a species of large trout that are but rarely taken with the fly. There is a diversity of opinion about these trout. Some claim that they are the northern char, while others assert that they are only a large *Salmo fontinalis*. Some of them weigh ten pounds or more each. I have never had the pleasure of seeing one, so I am unable to determine their species. One mile farther and you are at the bridge over the inlet to Bonuillies Lake, which is three and a half miles long by three-quarters of a mile in breadth. This lake contains both the silver and black lunge, weighing from two to six pounds each. A mile from the south, through the woods from this lake, is a small trout lake that contains the brook trout. Two and a half miles from the bridge brings you to the inlet of "Chaiu of Lakes," three in number, and from three-fourths to one mile in length each, connected by narrow crecks. The principal fish in these lakes are the silver lunge. Peter Cowan, Esq., of Cowausville, P. Q., after a three hours' fight, killed one there that weighed twenty-one pounds.

Another drive of a mile and a half, and you are at the inlet of Moose Pond, or Fraser Lake, which is about five miles in circumference. This lake contains the small black lunge and the speckled trout. Three or four rods below the bridge, in the inlet, and also in the outlet of this lake, three pound speckled trout are often taken. One more mile and you arrive at the inlet of Brompton Lake, at the landing place, which is called the "Old Mill," where you will find a dam by a mill-site, but no mill, &c., as the mill was cremated years ago, and its ashes have long since been swept away by the wind and flood. The water there tumbles over the old dam down the rocks into a dark deep pool, the abode of many large *Salmo fontinalis*. They will seldom rise to the fly, but are taken with a live minnow or a small trolling spoon. You launch your boat here and row down the sluggish stream three miles to the lake, which is about seven miles in length by three in breadth. You find here the speckled trout, the silver lunge, which vary in weight from three to twenty-five pounds, the black lunge, from two to ten pounds, and a short, thick lunge, which hardly ever exceeds two pounds in weight. The latter fish are only caught by down fishing in very deep water. The club house is situated on a small island near the middle of the lake. At the west side of the lake a small creek comes in, which is the outlet of Mud Lake, and another nameless lake. Mud Lake is about a mile long, and contains both lunge and speckled trout. Two miles east from the lunge lake is Little Brompton Lake, which is nearly two miles long. Two and a half miles east from the south end of the large lake is a body of water called Key Pond. This pond is somewhat larger than Little Brompton. Both these lakes contain lunge. Three miles south from the "Old Mill" is Trout Lake, which is about two miles long. Speckled trout have been caught there that tipped up the beam at the six pound notch. This lake is only six miles by a good road from Magog.

The village of Magog is pleasantly situated on the outlet of Lake Memphremagog, and is twenty-one miles east from Waterloo, sixteen from Sherbrooke, eleven miles from Ayers Flat, a small station on the Passumpsic Railroad, and thirty miles north of Newport, Vt. It is connected with the first named places by a daily line of stages, and with Newport during the summer season by the little steamboat Lady of the Lake, which makes daily trips. Mine host "Ash Hubbard," of the Park House, will take good care of the sportsman when he visits Magog. From the verandah in front of the hotel you have a fine view of the lake and the mountains beyond it. Mt. Orford, the highest mountain in the Dominion, looms up in the northwest to the right of the lake and but six miles away. From the top of this mountain, on a clear day, thirty-two lakes can be counted in its immediate vicinity. Between the hotel and the mountain are several good trout streams, with Orford Lake and Hopp's Pond near by, and also northeast from the mountain, towards Trout Lake, near Brompton, are other good trout waters. Ten miles east from the village, near Ayers Flat, is Massiwippi Lake, which is some twelve miles long, and contained a great variety of fish, but the spear and net has sadly diminished their numbers. Six miles southeast from the hotel is Loveriug's Pond, which was once famous for its "big trout," but is now seldom visited by the angler. In the lake near the hotel the silver, black, and racer lunge are taken in large quantities. Some of the silver lunge grow to a very large size. Three pound speckled trout are often caught in the rapids, in the outlet near the hotel, during the months of May and June. In the evening, after you have come in from a hard day's sport, and have satisfied your fisherman's appetite with a goodly repast, prepared for you only as Mrs. H. can prepare it, light your cigar and stroll out on the veranda, where you seat yourself in an easy position, with back well down in the arm chair, and feet high up on the railing. You there get the cool breeze from off the rippling waters, and enjoy your smoke and a beautiful view of Mt. Orford, looming up in the fast deepening gloom, with clear, sharp-cut outlines against the western sky. Call "Ash" to a seat beside you and request him to tell you about that big trout he killed in the still water on the Black River, or about the fight he had with a large maskalonge in the Farnham River; then again kindly inquire if he ever owned a good hound. After he has fully answered your inquiries, it will be time to turn in, and if you do not go to your couch thankful that your lines have fallen in such pleasant places, perfectly happy, and satisfied with yourself and the rest of the world generally, you are an unappreciative wretch, and deserve to never have another trout rise to your fly, for you have none of that appreciation for the good things of this life, which a true sportsman ever has.

The town of Sherbrooke is situated on the line of the Grand Trunk Railway, at the junction of the Magog and St. Francis rivers, and is the terminus of the Massiwippi branch of the Passumpsic Railroad, and also is the head of the unfinished railways—the Kennebec and Megantic roads—that are completed but a short distance out into the Megantic country. The Magog House is the best hotel in Sherbrooke, where you will find good accommodations, etc. The distance from the hotel to Brompton Lake is fourteen miles over a passable road.

There are many other small lakes and streams in the townships that have trout in them besides those I have mentioned.

In conclusion, I would say to those who may visit the township waters, if you go there with the expectation of catching full baskets of large trout every day you will be woefully disappointed, for though there are trout there as large, and even larger, than those that I have mentioned, it requires the finest tackle, backed by skill in using it, and a thorough knowledge of their habits, to capture them successfully. I have often seen a party of verdant anglers come in and give a poor report of some lake that they had been camping near, when an experienced fly fisher would go there alone the next day and bring home more trout the same night than the former party had caught during their week's stay there. The best flies for the *Salmo fontinalis* in those waters are the Canada fly and any medium-sized brown-winged fly. The lunge never rise to the fly, but are taken by trolling and by down fishing. The best bait is the live minnow, and the best season for trolling is from May 25th to July 1st. With a moderate amount of skill you will be sure of fair sport, and he pleased with the country.

STANSTEAD.

For Forest and Stream.

A FOX CHASE.

WHAT among hunters is more exciting than a fox chase?

One poor little fox is enough to keep a whole party of men, and a whole pack of hounds in a pleasurable excitement for at least hours at a time. And may we not ask even here, is it not cruel sport?

I am naturally fond of dog and gun, and shall I confess it? Yes, I have been too fond of the latter, and one of my dreams has been of a fox chase. The past winter I partly spent in Virginia, in the southeastern part, near the Nottaway River. Here I found some kinds of game and fur plenty, indeed, but had no thought of having my dream realized in regard to the fox.

By the way, down in that country the riding is almost all done on horseback, the roads being rough and the country wild and woody.

All knew that I was a stranger and came from the North, and very little was expected of me in regard to hunting or riding either. But my having been reared on a farm, and also being passionately fond of horses, was greatly in my favor, and I was able to participate in the rough pleasures of the country. I rode considerable, for my business kept me much in the saddle, and one day I was riding leisurely along, feeling somewhat homesick, and yet admiring the country, for it is a beautiful country with its sunny southern skies, its dark pine woods and other groves, its many hills, consequently its valleys and its beautiful springing brooks, which rippled and bubbled, and attended me in all my journeyings.

I was meditating, as I said above, when suddenly a horseman hailed me, with "I say, Harry, they are commencing a fox chase just beyond here, come, let us join them." How quickly my dreaming mood vanished, even my homesickness was for the time cured, and all knew that this sickness is not cured by any ordinary means. We sped on our horses through brambles, brush, and briars, and at length joined the party.

It was a bright, breezy day, and the men's faces were also bright with the pleasure before them. The men were laughing, shouting, and talking, by turns, or rather all at once so that it reminded me of Babel, for surely if one had called for brick another would have brought him straw. There were about a dozen men and twenty-five hounds, and these last were already baying loudly, for they had scented their game, and you all know that hounds are extremely found of the chase.

Our leader blew his horn and cried, "hie! and away!" and now the excitement was intense; the fox of course have the most briary, tanglesome path, and also sought for the low, marshy ground, where the scent was not likely to lie, and well for a time did he keep the advantage of us all.

The horses fairly flew over the ground, the men hollowed, laughed, whistled to the dogs, shouted at one another, and gave themselves up to the mad cap sport. Our caps were sometimes on our heads, sometimes carried in our hands, or tucked under our arms, or clutched by our teeth, and sometimes, as the darkey said, "dey wasn't no ear." We utterly ruined the turnip field of one farmer, and dashed through patches of grain without one remorseful thought.

My horse leaped the fences, for to that he had been trained, and I for a time kept my seat admirably, but oh, how true, that "pride must have a fall." As we splashed and dashed through briars, marshes, groves, and brooks, I began to think like this: These southrons shall see that I am not behind the best of them if the chase is new to me.

I had thus began to congratulate myself when my horse brought me to a brook, where by some strange maneuver

he contrived to throw me into the water, and then sped on as only a horse let loose can do. Up I sprang and shook myself something as you have seen a great Newfoundland dog shake off the water.

I howled, "whoa," to the top of my voice, and then groaned aloud as I saw my horse rapidly disappearing from my sight.

What should I do now? The fox would be caught and I also would be caught in a queer scrape. I looked about me and saw close by one poor little hut, though this was almost directly in the midst of a pine forest. I tapped upon the door, an old colored woman appeared, and asked, "What does massa want?" I asked for a horse and also anxiously inquired for the fox. "Dar am an ole mare in the stable, massa; he kick some but I g'ess yer kin use um," was the reply to the first query.

I thanked my friend in need, and brought out the stiffest jointed, boniest, and longest toothed animal I ever saw, and endeavored to mount her.

She kicked furiously, but after some difficulty I got upon her back, but staid there a very short time. She kicked as if life depended upon her kicking, and I hoped she would kick it out and be done, but no; she at length reared upon her hind feet and landed me on the soft ground.

I now gave up the kicker in despair, and revengefully gave her a kick or two in return for her liberality in that respect to myself.

I concluded the chase was a fraud, and was about to start for home when a companion rode up, leading my horse by the bridle. The old woman was willing to assist me if she could, though her face was full of laughter at my adventure with the kicker.

"De fox went down dat ar way, massas, jus' 'bout a mile long," said she.

We hurried our beasts, hoping to make up for lost time, and perhaps would, had not I met with another mishap.

We were dashing along at full speed, when I saw just before me a huge tree whose branches hung very low, but I thought by managing rightly I could ride under.

It was crowding work, and to help myself, I was forced to catch hold of the bending boughs. The horse asked not, "was all clear?" but sped on and left poor me hanging by my hands to the tree.

My companion was out of sight and hearing, and I felt that perhaps Absalom's fate would be mine. With a desperate effort I let go and came down hard, though safe, upon my feet.

When I found my way out of the wood, I soon heard that the fox was caught, and meekly asked if my horse had been caught too. No one seemed to know, but when I reached home the beast was there and whinnied at sight of myself; perhaps he had felt somewhat conscience stricken. I have not felt any drawings towards a fox chase since then, but there is no knowing what temptation might lead me to do.

A. D. W.

Fish Culture.

—At a meeting of the Massachusetts Anglers' Association, held at its rooms in Boston last week, a committee of five, consisting of Dr. Ordway, Hon. Daniel Needham, L. Pronty, Weston Lewis, and Walter M. Brackett was appointed to wait upon the Governor and request that some action should be taken by which local protection during close time would be more rigidly enforced.

Suitable resolutions were passed on the death of Mr. John F. Mills, one of the Vice Presidents of the Association. The vacancy was filled by the election of Col. Daniel Needham.

—Millon P. Pierce, of Aquadale, Wenonah, N. J., has sent us an interesting letter, which we shall print next week, describing how the musk-rats bored through the dam of his bass pond and let the water off, liberating most of the fish.

THE CULTURE OF STRIPED BASS.—We alluded a month ago to the efforts being made by some gentlemen to propagate striped bass in Coney Island Creek, on Long Island. Genio C. Scott, Esq., who is supposed to know as much about striped bass as any other man, and we believe he does, contributes an article on this subject to the *Spirit of the Times* of April 29th, from which we make an extract. He says:—

"It has been a matter of surprise with some that the Fishery Commissioners have neglected the culture of striped bass. The subject of propagating striped bass is new. The population along the coast, field sportsmen, and men who fish for a livelihood have seen with deep regret and apprehension that striped bass are annually becoming more scarce.

The depletion of the bass shoals is attributable to the vast shoals of porpoises which forage along the bays and inlets, from the Carolinas to Maine, and to the toleration of fyke and gill-nets with small meshes set near the shore at every in point jutting out from the shores of bays, estuaries, and spawning beds from the bays. Also, and worst of all, from pound nets drawn across the channels and sluice-ways, where bass wander to feed on shrimp, crabs, and other crustacea.

The striped bass differs from the salmon in selecting his paths of migration. Whereas the salmon travels at night, and follows the channel, the bass follows the sedgy banks, where they may feed on shrimp, squid, minnows, and crustacea. The bass are, therefore, more easily and cheaply captured by netting, with either stationary fykes or ponuds with arms extending from the shore to the channel.

One of the worst causes of the growing scarcity of striped bass is the lawlessness of marketmen. The marble counters of Fulton Fish Market are frequently laden with small bass which weigh not more than a quarter of a pound on an average. The law should prevent the sale of bass weighing less than a pound. It is questionable whether striped bass do not spawn twice a year. I know they spawn in April, and in September the Hell Gate trollers have frequently observed the spawners in the act of extruding the ova.

It is scarcely necessary to build tanks and hatching-houses for propagating striped bass; but it is of pressing importance that laws should be enacted, to deal in gravid bass, and bass which are under a pound in weight.

For propagating striped bass nature has done more than for conserving and producing an increase of most other fishes. All the saline ponds and tidal backsets along the coast may be cheaply constructed into hatching ponds of vast dimensions. Many of them have each but a narrow inlet, which feeds the pond. At Point Judith there is a pond of this kind, and back from the Seconnet River in Rhode Island there are one hundred salt-water ponds thronged by striped bass to winter. The mouths of these ponds might be cheaply dammed, so as to prevent the egress of the bass after November, and still to permit the ebb and flow of the tides. By this method fish preserves for hatching purposes might be made at a very small expense, and no doubt it would prove a paying enterprise. It would not cost more to propagate a million fingerling striped bass than it costs by the usual process to propagate one trout fingerling; and beside, striped bass are of rapid growth, and attain to weight superior to that of the salmon. There is more money, more real good, with less labor and expense, than there is in any other fishery enterprise which offers in these days of small profits."

THE SPAWNING SEASON FOR BLACK BASS.

As many inquiries are being made concerning close seasons for bass, and the precise time in which these fish deposit their eggs, it will not be out of place to insert here an extract from one of Mr. Wilmot's reports to the Government of Canada, from which practical information on this interesting subject may be obtained. The close season now in Canada for bass is from the 15th of May to the 15th of June, brought about no doubt from the practical experiments made by Mr. Wilmot, which are here related:—

"A trial was made last season (1873) in the rearing of black bass, in order to show clearly by practical experiments the exact season in which this fish deposits its eggs and hatches out its young. Having no doubts in my mind as to the proper time, but hearing so many different views advanced by others, I considered it advisable to investigate the subject fully by close observation and a thorough trial. Independently of the knowledge to be thus obtained of the habits of this fish, I had another object in view from which, when fully demonstrated, I could with perfect certainty recommend to the Government a correct close season for black bass throughout the country.

"The close season hitherto prescribed has not protected this fish during its spawning time, and fishermen have been killing them in greater numbers when they were approaching their spawning beds and in the act of laying their eggs than at any other time. The consequence is that this valuable fish is now becoming, comparatively speaking, very scarce.

"During last winter I procured a number of black bass at the Bay of Quinte, a few miles below the town of Belleville. They were obtained from fishermen who were then engaged in catching them through holes in the ice with hook and line for the market, where they were eagerly sought for. These were carried home in barrels partly filled with water, and put into the tanks at the breeding-house. By far the better plan, however, was in the month of May following, when I got them from the fishermen while hauling their seines, at which time they kill large numbers on the Bay of Quinte. These were also taken home safely from Belleville by rail, and placed in a pond previously prepared for them. They did exceedingly well, being regularly fed and eating very greedily.

"The pond was about twenty rods long in its windings, with an average width of one and a half rods, the depth varying from eighteen inches to four feet, with a constant flow of fresh water. The fish had sufficient freedom, and appeared as active and healthy as in the waters of their native bays and rivers. A few losses were sustained in catching and carrying, but they were trifling, leaving a stock in the pond of nearly one hundred.

"On the 25th of May some of the bass began to pair off, and to commence making nests, some being made in the deepest parts of the pond, others in the shallow places. Some were formed on gravel, others upon sunken sticks at the bottom of the pond. The beds were invariably hollowed out a little, and were made very clean by the action of the fish, which gave them a bright appearance. They were round in shape, and varied from twelve to eighteen inches in diameter. Upon these the parent fish deposited their eggs and milt.

"Nest-making terminated about the 10th of June, (some were later) the time elapsing from the first formation of these beds until the young fry were noticeable, varied from twelve to sixteen days, and a further period of five and six days took place before the little fish left the beds. After the eggs were first laid they were seen with diffidently through the water upon the nests. The surface of the beds presented in a few days a very dark appearance. When hatched out, a perfect mass of little black animals, not unlike tadpoles, covered the whole bed. After five or six days, as stated above, they disappeared from the nests, among the weeds and other substances, where hiding places could be found.

"It was curious to observe the extreme solicitude and watchfulness displayed by the parent fish from the time of hatching until the young bass left the beds, and the feeling seemed to grow stronger, until such time as the fry disappeared among the weeds. So intent were the old fish in caring for their progeny, that they seemed to care nothing for their own safety, exposing themselves continually to be destroyed by the simplest and rudest kind of weapon."

SALMON IN CONNECTICUT.—The fish commissioners have now at Westport 450,000 young salmon, ready to be put in the rivers of this State early in May. They are of the Kennebec variety. They have also at Branford 75,000 of the land-locked variety; and at Westport 25,000 of the same; all of which will be distributed this spring. Last December, 300,000 of the California breed were put into the Farmington river; 100,000 into the Housatonic, at New Milford; and 50,000 into the Shetucket.

Of the land-lock variety, 10,000 have been put into the Twin lakes, in Salisbury; 10,000 in Spectacle lake, in South Kent; 10,000 in Long pond, Winsted, and 5,000 in the pond in Norfolk.

Of the 450,000 now at Westport, 300,000 will be put into the Farmington river in May, and 100,000 in the Housatonic and Thames rivers. Dr. Hudson informs us that the commissioners have never had such good luck with the spawn of the salmon as they have this year. They have also been most successful in the transportation of the young fish. This is owing to the supervision of George Ichiffe, the superintendent of the works at Westport, who has by a new style of can, shaped like an inverted V, succeeded in carrying the young fry to any point in the State, without losing a single fish.

The last supply of salmon was put into the Connecticut river in 1874, and if the experiment is successful, the fish will be fit to catch in 1878. If they do not appear that year, it is thought the experiment of re-introducing them into the Connecticut, will prove a failure.—*Hartford Times.*

THE LAWRENCE FISH-WAY.

MANCHESTER, N. H., April 28th, 1876.

EDITOR FOREST AND STREAM:—

My attention has been called to an article in your paper of the 20th inst. by Mr. Brackett, of the Massachusetts Fish Commission, in relation to the fish-way at Lawrence. The newspapers report me as having said at the annual meeting of the Fish and Game League of New Hampshire, that the fish-way at Lawrence was "more impassable than ever before," and that "at least two-thirds of the ladder had been carried away by the freshets, so that now it is totally useless." Mr. Brackett, who is an intelligent and worthy gentleman in every respect, so far as I know, says the report does me great injustice, and makes me responsible for statements which are not true. He also says that on the 10th of April he visited the fishway with Mr. Storrow, and "found that no part of the fish-way had been carried away by the freshet—not even so much as a plank or timber started."

In common with other gentlemen I have long felt a deep interest in our New Hampshire fisheries. The great obstacles in the way of re-stocking our streams have been the impassable dams across the rivers. Hence our attention has been turned to the construction of practical fish-ways, so as to allow migrating fish to ascend and descend the streams in accordance with their natural habits. The dam at Lawrence is some twenty-five feet high, and is the first obstruction in the Merrimack above tide flow. For several years past efforts have been made by the Commissioners of Massachusetts to construct a fish-way that would meet the views and wishes of the New Hampshire people. To this end our sister State has expended considerable sums of money from time to time; but still our people have not been satisfied. They saw no alewives, shad, eels, or salmon in our falls, where formerly they were abundant. Two years ago I examined the fish-way at Lawrence for myself, and became convinced that it was simply impossible for fish to ascend past the dam, and so reported to the League. I am certain that the Commissioners of Massachusetts themselves regarded the structure for practical purposes as a failure; for last year they made alterations, and some thought "improvements" in the lower terminus of the ladder. I heard of these alterations, and to gain a personal knowledge of what had been done, on the 3d day of April I went to Lawrence to inspect the *improved* fish-way, that I might report correctly at the annual meeting of the League, which was to be held the next day. On visiting the dam, to my surprise I found the lower boxes, which were partly in the water, filled with loose stones, and the outlets nearly choked up with the same material, and nine of the sixteen boxes gone! The next day I reported the result of my inspection, and stated the fish-way to be "totally useless," as any other witness would have done.

On reading Mr. Brackett's article in the FOREST AND STREAM I at once decided there must be something wrong in his statement or my own, and went immediately to Lawrence for a more thorough inspection. This was on the 24th of April, fourteen days after Mr. Brackett said he was there and "found that no part of the fish-way had been carried away." On the bank of the river were two men, who informed me that they commenced that morning to put back the nine boxes that had been carried away—not "by freshets," as I very naturally supposed—but by human hands, to prevent the water and fish from doing it. Before this writing I presume the fish-way has been thoroughly repaired, and is in as good condition as at the close of the season. But whether this fish-way is in perfect order, or in ruins, it matters little to our people as long as the fish do not ascend it. As a contrivance for furnishing a way through which salmon or other migratory fish may find even a difficult passage to the headwaters of the Merrimack, I must regard it as a complete failure, until presented with more satisfactory evidence than has yet come under my observation. I have no idea that a fish of any kind ever ascended the ladders into the river above the dam, nor will there be one in accomplish so wonderful a feat until the structure is remodelled and built on a larger scale.

JOSEPH KIDDER.

INLAND FISHES DO MIGRATE.

CINCINNATI, Ohio, April 22d, 1876.

EDITOR FOREST AND STREAM:—

Mr. Klippart, in concluding his letter of March 20th, says "he is very desirous of having his acts as Fish Commissioner primative of the best interests of the State." This is a gratifying assurance to me, and being a stranger to Mr. Klippart, I accept it as given. Doubtless, also, it will prove equally gratifying to many who are not strangers to him, but who, from his course lately, have been driven to doubt on the subject. Mr. Klippart confesses himself to be in need of information upon some elementary points, and asks for instruction through your columns. If he had with sincerity sought such information before he supported an obnoxious bill in the Legislature, which was justly defeated despite his advocacy, it would have been given to him as freely as it was to others who sought it, and then, indeed, he could have made his acts promotive of the best interests of the State.

In regard to his letter, I fear we cannot proceed very far in the discussion he invites, until certain facts are more definitely settled. He asserts first, and as the basis of his article, that the inland fish of the waters named by him are taken in those waters during every month in the year. If by this he means simply to say that a few specimens of the varieties named have been taken, I do not deny it. They are the residuum of the main body who have gone. They are the exception to the rule and prove it. But if his assertion goes to the extent of saying that all of the fish named which frequent those waters remain there in a body, that none migrate, but that they are taken as freely and in like numbers during every month of the year, then I must withhold my assent to the proposition, and call upon him for his proof, and at the outset we dissent widely on this question of fact, and can go no further upon it at present. But in the absence of his proof, and in order that Mr. Klippart may have the benefit of the learning, experience, and knowledge of one whom I am sure he will recognize instantly as being higher authority than he is, and certainly higher than I am, I will give him the statement of Prof. S. F. Baird, U. S. Fish Commissioner, on the point:—

"No principle is better established than that the maintenance of the fish supply in any water requires free and unobstructed access from its source to its mouth. Nearly all fish have a certain form of migration, occupying different quarters in the winter from those of the spring and summer.

"It is not merely with reference to salmon and shad that fishways are desirable, but all fish in a stream have more or less of migration between the winter and summer season; just as certain species ascend from the sea to the headwaters, so others that winter in the lower and deeper waters of a river move upward at the spawning season, in search of cooler temperature and better spawning grounds, or for some other reason. A dam will prevent this action, and concentrate the fish lower down.

"If, before the dam is erected, there be a supply of the young fishes above it, they will be certain to descend after they have attained a proper degree of maturity, and in this way the fish that were in the water

above the dam become more and more scarce, until finally the stock is reduced to a minimum."

It is out of this minimum supply, if at all, that the fish referred to by Mr. Klippart have been taken during all months of the year.

"The result of dams diminishing the number of purely fresh water fish has not received the same attention in this country that it has abroad; but it is a well established principle, from centuries of inquiry in Germany and elsewhere, that a very extensive migration takes place among the purely fresh water fish."

When hereafter any informant of Mr. Klippart asserts that fish chutes are useless, let him reply in the following strong but appropriate quotation:—

"The assertion that chutes upon any plan are worthless, is founded upon the grossest ignorance of the history of fish culture and fish protection. There are localities in which, for local causes, fishways have not proved as efficient as had been anticipated; but for one instance of this kind there is no difficulty in showing a hundred that answer every purpose."

My answers, therefore, categorically, to Mr. Klippart are:—

First—Our inland fishes are migratory, and chutes are necessary for their passage.

Second—They are not taken in our water during every month of the year as a body, but only those few who remain because of some unexplained cause are ever then captured.

Third—That while it is true of fishes, and of everything else, that more can be bought from the world at large than can be reared at home, yet that furnishes no reason for destroying the few we have.

THOMAS A. LOGAN,
President of the Ohio State Asso. for the Protection of Game and Fish.

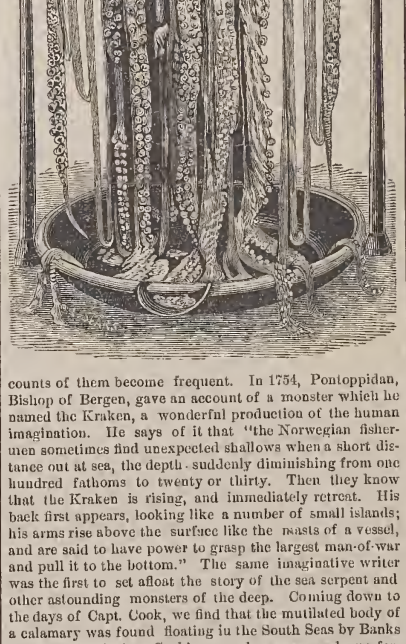
Natural History.

[This Department is under the charge of a competent Naturalist, indorsed by the Smithsonian Institution, and will henceforth be made a special feature of this paper. All communications, notes, queries, remarks, and seasonal observations will receive careful attention.]

THE GREAT OCTOPUS.

In our issue of Jan. 15th, 1874, will be found a very interesting article by Rev. M. Harvey, of St. Johns, N. F., describing Cephalopods, with an accompanying engraving from a photograph of one of these creatures taken on the Newfoundland coast at that time. The article and photograph were then regarded with so much interest by scientific men that the first was reproduced in Europe from electrotypes furnished by the proprietors of this paper upon application. It was the first photograph ever taken of an octopus. We have therefore thought it would be gratifying to those of our readers who did not then see the picture of this hideous creature to examine it now, and accordingly print it a second time, in connection with the article which follows, and which has never been printed before. It adds information to that given in the article of January, 1874.—ED.

ST. JOHNS, Newfoundland, April, 1876.



EDITOR FOREST AND STREAM:—

"A very great interest was awakened among naturalists on both sides the Atlantic by the discovery which I was fortunate enough to make in 1873 of the only perfect specimen of these colossal cephalopods. The effect of that discovery has been to remove all doubt as to the existence of cuttle fish of very large dimensions, and to furnish data for a scientific investigation of the structure of a species of fishes, the very existence of which was doubted or denied by the most eminent naturalists. No fact in nature can be unimportant or fruitless, and the discovery of these cephalopods, as we shall see presently, has already, to some scientific minds, suggested important possibilities in the study of marine zoology.

Curiously enough it would seem that the seas around Newfoundland are the favorite resort of these marine monsters, as scarcely a year elapses of late without bringing news of some specimens having either been seen or cast ashore. We may hope, therefore, that as the importance of preserving such specimens as may turn up becomes more generally known among the inhabitants of Newfoundland, numerous representatives of the different genera and species will, in the course of time, be obtained, and a thorough knowledge gained of these remarkable creatures. The latest arrival of one of the long-armed tribe took place in December, 1874, at Grand Bank, on the shores of Fortune Bay. Here a splendid specimen was flung ashore, unmutilated and fresh, but unhappily before any one who knew its value arrived at the spot, it was cut up and partly destroyed by the fishermen. Little did these honest men dream of the loss science sustained when they flung the fragments of what, in their eyes, was only a disgusting slimy mass to their hungry dogs. Fortunately, however, Mr. Geo. Simms, Magistrate of Grand Bank, heard of the strange fish which had landed, and was in time to secure some important measurements of the creature. In compliance with my request he has kindly furnished me with full particulars of his examination of the fragments which remained. He found the tentacula, or long arms, twenty-six feet in length and sixteen inches in circumference. The eight short arms were one third the length of the long ones, and about the same in circumference. The head or central part, from which the arms radiated, was thirty-six inches in circumference. The body was thirteen and a half feet in length, measuring from the point of junction with the central part to the extremity of the tail; so that the entire length of the body must have been over fourteen feet. The circumference of the body is not given. Mr. Simms was fortunately able to secure the beak and one sucker, which he presented to me. These I have forwarded to Prof. Verrill, of Yale College, New Haven, who has made a special study of the whole subject. The beak is very large and powerful, and the sucker is over an inch in diameter, having denticulated edges. It is singular to find that though the body of this specimen was twice the length of the Logie Bay specimen, the tentacula were only two feet longer, though very much thicker. Altogether this must have been a formidable monster to encounter, with its body fourteen feet in length, and at least ten feet in circumference. Those arms, twenty-six feet in length, and armed at the extremities with powerful suckers, can be clasped around any object, and are worked by the creature as dexterously as a cat uses her paws. To be enfolded in the whole ten arms, covered as they are with perhaps 1,200 suckers which sink into the flesh of a victim and seem to drink the blood, while the beak of the ferocious creature rends and destroys its prey, would be a truly awful fate.

The division decapoda of the cephalopodous (head-footed) mollusca embraces the cuttle fish, *Sepiadæ*, and the calamaries or squids, *Teuthidæ*. The latter are distinguished from the ordinary cuttle fish by the possession of larger fins and a greater length of body, so that they are better fitted for an oceanic existence. Another point of difference is, that instead of the cuttle-bone, the calamaries possess a horny, transparent "pen," or *gladius*, which, in combination with the ink-bag of this group, has gained for them the popular appellation of the pen-and-ink fish.

It is curious to find that, during the Roman period, the Mediterranean was generally assigned as the habitat of certain gigantic cephalopods, regarding which many fables were related by ancient writers, all of which, we know now, must have had some solid foundation of facts. The most striking narrative is from the pen of Pliny, who relates that one of these creatures was destroyed on the coast of Spain, whose head was the size of a cask, one of the arms measuring thirty feet. It is remarkable that two of the arms are described by Pliny as having been of much greater length than the others, recent discoveries having confirmed this observation of the old naturalists. From the termination of the Roman period till the commencement of the seventeenth century, no appearance of these oceanic monsters is on record; but after the latter date ac-

counts of them become frequent. In 1754, Pontoppidan, Bishop of Bergen, gave an account of a monster which he named the Kraken, a wonderful production of the human imagination. He says of it that "the Norwegian fishermen sometimes find unexpected shallows when a short distance out at sea, the depth suddenly diminishing from one hundred fathoms to twenty or thirty. Then they know that the Kraken is rising, and immediately retreat. His back first appears, looking like a number of small islands; his arms rise above the surface like the masts of a vessel, and are said to have power to grasp the largest man-of-war and pull it to the bottom." The same imaginative writer was the first to set afloat the story of the sea serpent and other astounding monsters of the deep. Coming down to the days of Capt. Cook, we find that the mutilated body of a calamary was found floating in the South Seas by Banks and Solanda, during Cook's second voyage, and was forwarded to the Museum of the Royal College of Surgeons, London, and there examined by Prof. Owen, who estimated that it was six feet long when perfect. The most complete and reliable account, up to recently, was that of the eminent naturalist, Prof. Steenstrup: "At the re-union of the Scandinavian naturalists at Copenhagen, in the year 1847, Prof. Steenstrup contributed a record of two gigantic cephalopods captured in the years 1639 and 1790 on the coasts of Zealand; and later on, in 1856, supplemented these observations with some remarks of high interest upon another specimen found at the Skag, Jutland, in the year 1854. This last example was cut to pieces by the fishermen to bait their lines, the dismembered body furnishing many barrow loads, or in its entire condition, according to some writers, filling a large cart. The pharynx of this monster which, with its contained beak, equalled in size an infant's head, was unfortunately the only portion of the animal preserved. This, however, with the records of the two examples from the neighboring islands of Zealand, supplied Prof. Steenstrup with material for the institution of his new genus *Architeuthis dux*, he, according to Crosse and Fischer, bestowing upon the species of which the pharynx was preserved the title of *Architeuthis dux*, and upon that represented by the two examples recorded as captured in the years 1639 and 1790, the provisional one of *Architeuthis monachus*."

Among British naturalists, W. Saville Kent, F. L. S., late Superintending Naturalist of the Brighton Aquarium, now of the Manchester Aquarium, has devoted most attention to the study of these oceanic monstrosities. In a highly interesting article in the *Popular Science Review* for April, 1874, he gives the results of his examination of the subject, dwelling at length on my account of the arm cut off by the fishermen in Conception Bay, as well as that of the specimen from Logie Bay, and enlarging on their importance he proposes "in the event of it not being possible to identify the St. John's specimens with Prof. Steenstrup's *Architeuthis*, to institute for them the generic title of *Megaloteuthis*, or giant calamary, and to further distinguish them, both being of the same species as *Megaloteuthis Harveyi*, in recognition of the great service to science rendered through Mr. Harvey's steps taken to preserve these valuable specimens. To this gentleman, indeed, we are indebted for the means of solving and settling at rest forever the long-vexed problem of the existence even of these formidable monsters of the deep." Mr. Kent concludes his valuable paper in the following terms:—

"Having satisfactorily established the existence of these monarchs of the ocean, it now remains for science to elucidate their habits and social economy. The facilities for this, however, are not at present very extensive. The fact of many individuals having made their appearance within a limited area, and at intervals following with marked closeness upon one another, would seem to indicate that they are gregarious, and in this respect participate in a habit dominant with the majority of their less pretentious congeners. In the common squid—*loligo*—the number of ova deposited by the female is something astounding, having been computed by Bohadsch at no less than 40,000! If anything approaching such a degree of prolificness obtains in these giants of their race, it is a matter of wonder that more has not been seen of them. Against this, however, it may be argued that, like the members of the whale tribe, they usually affect the open ocean, and only approach the land when driven by stress of wind or tide. Unlike the whales, a shoal of these might pass a ship unnoticed, having no occasion to raise the surface of their bodies above the level of the water to take in atmospheric air, as with the former. The great speed, moreover, with which all members of this group shoot through the medium they inhabit aided by their powerful vision, would enable them to avoid with ease a threatened danger in the form of an approaching ship. Associated with this aspect it is also worthy of note that in the majority of instances the examples encountered have been dead, or in a mutilated or exhausted condition.

"The question of the food upon which these monsters live has not yet been determined, though it in all probability consists principally of living fish, in common with most of their predacious race. The destruction they work among the finny tribes in this case must, on account of their enormous size, be very great; but as through the scale of nature we find one tribe warring upon another, and finally subservient for the support of one still more powerful, we shall find that these giant calamaries are themselves an easy prey to other tenants of the deep. The whales, in fact, with which they have been compared in size, are their most formidable and implacable foes, and probably the only animals existing who could oppose these monsters with any prospect of success in their native element. Our remarks in this case are of course restricted to the toothed whales, and with these we have abundant evidence to show that the colossal cephalopods constitute a favorite diet.

"So large a mass of evidence has now been laid before our readers, that to further augment it would be needless. Summing up the whole, we are forced to admit that this group of cephalopodous molluscs contains representatives of enormous dimensions distributed in the seas throughout the globe, and embracing, in all probability, many distinct genera and species. Such is the formidable size of these giant calamaries that they vie even with the cetacea in magnitude, and in this respect yield to no other animals now existing. It further appears obvious that the numerous tales and traditions that have been current from the earliest times concerning the existence of colossal species of this race, though in some instances unscrupulously exaggerated, had in all probability, in the main, a background work of fact, and can be no longer passed over as the mere fabrications of a disordered mind, as we have been hitherto inclined to accept them."

Since the publication of the article from which the foregoing extracts are taken, Prof. Verrill of Yale College, to whom I forwarded fragments of the Logie Bay specimen, has made an exhaustive study of the whole subject, and has published the results of his investigations in the *American Naturalist* for January and February, 1875, and in the *American Journal of Science and Arts* for February, 1875. These are illustrated by beautiful engravings of the different parts of the creature, and by a restoration of the entire Logie Bay specimen. Prof. Verrill states in these articles that he is able to cite twelve American examples, and has had opportunity to study portions of five of these specimens. "These," he says, "evidently represent two distinct species, both of which belong to the genus *Architeuthis* of Steenstrup (or *Megaloteuthis* of Kent)." He proposes to name the one of these *Architeuthis princeps*, and the second he considers identical with the *Architeuthis monachus* of Steenstrup, and "seems to be the species most commonly met with on the coasts of Newfoundland and Labrador."

He says: "The most complete specimen that has ever come under scientific observation was captured in November, 1873, in Logie Bay, near St. John's, Newfoundland. It became entangled in herring nets, and was secured by the fishermen with some difficulty, and only after quite a struggle, during which its head was badly mutilated and severed from the body, and the eyes, most of the syphon-tube, and the front edge of the mantle were destroyed. Fortunately this specimen was secured by the Rev. M. Harvey, of St. Johns. After it had been photographed and measured, he attempted to preserve it entire in brine, but this was found to be ineffectual, and after decomposition had begun to destroy some of the most perishable parts,

he took it from the brine, and dividing it into several portions, preserved such parts as were still undecomposed in strong alcohol. These various portions are now in my possession, and with the photographs have enabled me to present a restoration, believed to be quite accurate, of the entire creature. Mr. Harvey has published popular accounts of this specimen, and the previously captured arm of a still larger one, in the *Maritime Monthly Magazine* of St. John, N. B., for March 1874, and in several newspapers. To him, therefore, we are mainly indebted for the latest and most important additions to our knowledge of these remarkable animals."

Prof. Verrill then proceeds to give elaborate accounts of the measurements and general character of the various portions. Of the jaws he says:—

"When in place, these jaws constitute a powerful beak, looking something like that of a parrot or hawk, except that the upper jaw shuts into the lower, instead of the reverse, as in birds. The color is dark brown, becoming almost black toward the tip, where its substance is thicker and firmer, and smoothly polished externally. The upper jaw measures 3.85 inches in total length, 1 inch in greatest breadth, and 2.50 from front to back. The lower jaw is 3 in. long, 2.75 broad and 2.65 from front to back. The small squids of our coast have a very similar pair of jaws. The most remarkable anatomical character observed in this specimen is found in the form and arrangement of the teeth on the 'lingual ribbon,' or *odontophore*, for in this respect it differs widely from all other known cephalopods. The ordinary squids and cuttle fish all have these teeth arranged in seven regular longitudinal rows, those of the three middle rows being generally two or three pronged, as in *Loligo pallida*, while the lateral rows have long, simple, fang like teeth. But in this species the teeth are very irregularly scattered over the surface of the broad, thin membrane, and it is difficult to trace the rows—if such they can be called—for the arrangement seems to be somewhat in irregular quincunx.

"From the above description it will be seen that the most important and the most characteristic features of this species, or rather of the genus to which it belongs, is found in the lingual dentition in the internal shell, in the form of the caudal fins, and in the cluster of small suckers and tubercles on the long arms. The three first of these peculiarities indicate a low or generalized structure, and therefore a low rank in our system of classification, unless it should be found to have some other characters not yet known, and of greater importance, which might outweigh those here given. It will appear, therefore, that this genus of huge squids should be classed below *Loligo*, which, in its turn, will go below *Ommastrephes*, to which genus the common squids of our northern coasts belong, for the latter genus has distinct eyelids, which are not found in *Loligo*, and the internal shell is also more specialized.

"The pen of our *Architeuthis* seems to resemble that of the ancient genus *Tendopsis*, found fossil in the jurassic formations, and contemporaneous with the huge marine saurians, *Ichthyosaurus*, *Plesiosaurus*, etc., the "sea serpent" of those ancient seas. May there not also be huge marine saurians still living in the North Atlantic, in company with the giant squids, but not yet known to naturalists? Such a belief seems quite reasonable when we consider how many species of great marine animals, both among cephalopods and cetaceans, are still known only from single specimens, or even mere fragments, generally obtained only by chance."

It will be seen from the concluding extract that the Prof. inclines to the belief that the discovery of the sea serpent is not quite an impossibility.

—By an unfortunate error last week, we signed the name of Harry W. Caudee to the article "Birds of Central New York," the writer of which was Mr. H. G. FOWLER, of Auburn, N. Y., whose name should be substituted.

A PECULIAR BIRD'S NEST.—We have received by the courtesy of Dr. C. C. Abbott, of Trenton, N. J., an old bird's nest which he recently found, and could not identify. It is 2½ inches deep and 2 inches in diameter. It is suspended from the slender forked branch of a spicewood. The nest is formed almost wholly of scraps of newspapers, tied to the twigs *with string*, and lined with the needle-like leaves of the white pine. This is undoubtedly a nest of the white-eyed vireo (*V. noveboracensis*). Wilson describes it as suspended by the upper edge, like those of all the vireos, and says: "Outwardly it is constructed of various light materials—bits of rotten wood, fibres of dry stalks, of weeds, and of *pieces of paper, commonly newspapers, an article almost always found about its nest*, so that some of my friends have given it the name of the 'Politician.'"

—The American Museum of Natural History at Central Park is to have an aquarium at its new building on Eighth avenue.

—Zoologists are looking forward to examining the four small elephants which the Prince of Wales is bringing home from India. One of the two kinds of elephants in Nepaul is small, not more than five feet high when adult. Professor Busk has found in the bone caves of Gibraltar, the remains of a pigmy elephant, and interest is aroused to know if these small ones from India will not prove to be the same species which long ago became extinct in Europe. Special arrangements are being made at the London Zoological Gardens for the Prince's valuable collection, which will be kept separate.

A WHITE SKUNK!—We have received a present of a white skunk (defunct), accompanied by the following letter. It is a beautiful creature; but albeit its skin is as spotless as snow, its breath is bad, and we have had to use chlorides and carbolic soap for a seven day's purification, after the taint left by the handling of it. The nasty thing! And yet—and yet—it is an object of great curiosity—to savans:—

FLATHEAD AGENCY,
MISSOULA CO., MONTANA, April 11th, 1876.

EDITOR FOREST AND STREAM:—

I have sent you by this mail a white skin What Is It? Trappers and Indians here say it is a white skunk. One man only—a half-breed—says he has seen one before. CILBILI.

[Albino skunk, and no mistake.—ED.]

REFLECTIONS UPON REFLECTIONS.

NEW HAVEN, Conn., April 14th, 1876.

EDITOR FOREST AND STREAM:—

Have you seen the book on birds by Theodore Jasper, published recently in numbers? How is it possible that such a book has been allowed by the author to go upon the market? The cuts of the birds and the positions are good; the text is good enough. But the coloring of the plates, how entirely unnatural! how consummately absurd! The author seems to have an insane propensity to produce an effect by reflecting colors on his birds from surrounding objects. For instance, in one plate the blue sky has cast a blue reflection over the backs of the birds, and this color has in turn been reflected from the birds to the trees, etc., in that vicinity. And from the grass below, which is colored a rich impossible yellow, there is another reflection to the breast of the birds, and indiscriminately over their bodies. If the author will allow such reflections on the birds he must not find fault if reflections are cast on his work. In fact, between the effect of the reflection from the sky and that from the ground, the original color is sometimes almost entirely lost. In other cases the wrong tints seems to have been applied without any definite aim. If an artist were engaged upon the painting of an Alderney cow, would he carefully sketch it, give it a graceful position, and then paint it a sky blue color, with red horns and tail, and a broad green stripe down the back? Surely this would be no more absurd than the manner in which Jasper has treated many of his birds.

ROBT. T. MORRIS.

THE LABRADOR DUCK.

ANN ARBOR, Mich., April 21th, 1876.

EDITOR FOREST AND STREAM:—

I would say in reply to Prof. Baird's call, in your issue of April 1st, for information of the Labrador duck, (*Camptolæmus labradorius*), that I have one specimen in my collection taken at Delhi Mill, Mich., April 17th, 1872. There is no specimen in the Michigan University Museum.

A. B. COVERT.

RECENT ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDEN.—One common boa (*Boa constrictor*). Purchased. One young alligator (*Alligator mississippiensis*). Presented by Master George English, Philadelphia. Three golden pheasants (*Thaumalea picta*). Purchased. Five silver pheasants (*Euplocamus nycthemerus*) Purchased. One robin (*Turdus migratorius*). Presented by John Pearsall, Philadelphia. One red-billed grebe (*Podilimbus podiceps*). Presented by Wm. Philips, Philadelphia. Two great horned owls (*Bubo virginianus*). Presented by Joseph M. Wilson, Washington, D. C. One snowy owl (*Nivea scandiaca*). Presented by Henry N. Stewart, Philadelphia. Two Guinea baboons (*Cynocephalus sphinx*), two pig-tailed monkeys (*Macacus nemestrinus*), four Macaque monkeys (*Macacus cynomolgus*), one sooty mangabey (*Cercocebus fuliginosus*), one cinnamon bear (*Ursus americanus* var.). Purchased. One woodcock (*Philohela minor*). Presented by Philip Rhoads, Lancaster, Pa. One horned grebe (*Podiceps cornutus*). Presented by ——. Three red foxes (*Vulpes fulvus*). Presented by Edgar F. Jordan, Philadelphia. One moose (*Alces machlis*). Purchased. One barn owl (*Strix pratincola*). Presented by ——. Two screech owls (*Scops asio*). Presented by Edgar Wiestling, Philadelphia. One young alligator (*Alligator mississippiensis*). Presented by Frank M. Scanlan, Philadelphia. One pair zebus (*Bos indicus*), four Bewick's swans (*Cygnus minor?*). Purchased. One loon (*Colymbus torquatus*). Presented by Joseph M. Wilson, Washington, D. C. One banded rattlesnake (*Crotalus durissus*). Presented by E. Krauser & Bro., Milton, Pa. Two sun bears, *Ursus malayanus*. One Colobus monkey, *Colobus cristatus*.

W. A. CONKLIN, Director.

Sea and River Fishing.

FISH IN SEASON IN MAY.

Trout, *Salmo fontinalis*.	Salmon Trout, *Salmo confinis*.
Salmon, *Salmo salar*.	Shad, *Alosa*.
Grayling, *Thymallus tricolor*.	Land-locked Salmon, *Salmo Gloveri*.

For list of seasonable trout flies for May see our issue of April 27th.

FISH IN MARKET.—The markets have been well supplied with fish during the past week, particularly with shad, the prices for which have fallen to 35 cents for North Rivers, 50 cents for Connecticut Rivers, and 25 cents each for Southern. The most marked feature has been the arrival of large quantities of pompano from Pensacola, and a reduction in the price of this delicious fish from $1 to 50 cents per pound. Striped bass are worth 15 cents; smelts, 15 cents; Kenebec salmon, 75 cents; California, do., 30 cents; mackerel, 30 cents each; white perch, 15 cents per pound; Spanish mackerel, 75 cents; green turtle, 20 cents; terrapin, $12 per doz.; halibut, 15 cents per pound; haddock, 8 cents; kingfish, 30 cents; codfish, 8 cents; black fish, 15 cents; flounders, 8 cents; eels, 18 cents; lobsters, 10 cents; sheepshead, 35 cents; scollops, $1 per gallon; soft clams, 40 to 60 cents per 100: whitefish, 18 cents per pound; pickerel, 15 cents; Canada brook trout, 15 cents; Long Island, $1; hard shell crabs, $4 per 100; soft, do., $3 per dozen.

—The rivers and lakes well to the northward are now clear of ice, and south of the St. Lawrence River the trout fishing season may be said to be fairly at hand. Snow still remains five feet deep at Quebec and beyond. It lies dense among the Adirondacks, where the lakes are not yet open, though the ice is daily expected to break up. Nevertheless there is clear passage from lake to lake through the entire great chain, and from them to the Gulf of St. Lawrence. The rivers of Maine are open, and navigation is resumed on Lake Champlain. In Nova Scotia, where the season is always much earlier than in any other part of the Canadian Dominion, the months of April and May are the most favorable for fly fishing for salmon, which begin to run as soon as the ice fairly breaks up in the rivers. Parties proposing to visit this province need not expect any success whatever after July 1st, whereas from the 15th of June to the 20th of July is the cream of the salmon fishing in New Brunswick and the St. Lawrence tributaries. We know of quite a number of leading American anglers who propose to visit the Canadian waters in June, some by invitation of the lessees, and some to test the unleased rivers, where, it will be remembered as we informed our readers a month ago, fishing privileges are granted for the very moderate sum of $1 per day per rod in the Dartmouth and Restigouche Rivers, the latter of which is famous for its large salmon, and one of the finest rivers in the Province. This is a privilege which our anglers ought to avail themselves of, the more especially as the locality is made easy of access by the completion of the Intercolonial Railway of Canada, *via* Quebec and Rivière du Loup, or via St. John and Shedine.

Land-locked salmon are found in the eastern and western Grand Lakes of Maine, the latter more generally known as the Schoodies, reached by steamers from Eastport and Calais, and the former by the E. and N. A. Railroad from Bangor. They are also taken in the Sebec Lake, reached by the Piscataquis Railroad, and in Stoney Lake, in Canada, which lies back of Peterborough; also in the Upper Saguenay at the grand discharge of Lake St. John, where they are locally known as winninnish, beginning to run about the middle of June. In all other localities mentioned May is decidedly the best month for taking these fish, not only because the run is better, but because there are no black flies to molest, and few anglers out. In June there are two fishermen to every fish.

Brook trout will now be taken in the quickest water of running streams; in lakes they are scattered everywhere. We gave a list of trout flies for May in our last issue. Salmon trout are also near the surface, and take the troll freely throughout the month; they will sometimes rise to the fly, and afford good sport.

Grayling abound in the Michigan streams, and the numerous authentic articles which we have printed from Fred Mather, Uncle Thad Norris, and others in back numbers of FOREST AND STREAM will instruct the angler when, where, and how to fish for them. April, May, and June are the best months, but the fish are game all through the summer. The Grand Rapids and Indiana Railroad traverses the country which the grayling inhabit, and the advertisement which we print for the company this week will give our readers much information.

Shad-fishing with fly is in order, but the interest in this sport seems to have been evanescent. We do not think it the most exciting in the world, but better than no fishing.

Altogether May is the angler's chosen month, and he who would exercise his prerogative should go forth soon and make the most of it. Our local reports will indicate the condition of the streams and fishing propects in various States.

—Up to the present time reliable private advices from the Newfoundland sealers, report 12 steamers to have arrived from the ice, bringing about 130,000 seals, the value of which is estimated at over $400,000. Eight steamers and all of the sailing vessels are as yet unaccounted for, and the presumption is that the steamers still out have fared badly, and that few of the sailing vessels will do well.

—Striped bass, weighing two and a half pounds, will be caught on the "Jersey Flats" and other localities in our harbor during the present month, while on their way up the river to spawn. They are in good condition now, although June is an off month. The veteran angler, Andrew Clerk, Esq., with his vivacious and enthusiastic successor, Mr. Abbey, and other chosen comrades, will test their quality and temper in the coming days, and we shall be pleased to report a goodly catch as the result of their endeavors.

—A southern correspondent describes a primitive method of fishing as follows:—

"Pike or jack, as they are called here, are taken in large quantities in the mill-ponds in the Carolinas by holding a torch, at night, over the centre of a canoe and rocking it while moving down stream. The motion with the light attracts the fish, who jump into the boat, often in large numbers."

—The traffic in fresh fish over the Intercolonial Railway of Canada for the winter of 1875-6 amounted to 30 cases, 4,044 barrels, and 4,639 boxes. The sales were made chiefly in the United States.

—Good trouting can be had at Hillsgrove, Sullivan county, Pa. For particulars address R. Biddle at that place.

—It is reported that specimens of salmon, weighing nearly a pound each, have recently been caught in sciucs in Paweatuck River, Connecticut.

PENNSYLVANIA—*Philadelphia, May 1st.*—The shad fishing has been about the same this week. The catch has been better than middling. One gill-net brought in 57 this morning from one drift. Of these, one weighed 7¼ and another 6 pounds. The law making a close time from sun set on Saturday until midnight on Sunday meets with some opposition, but thanks to the vigilance of the fish wardens, and especially of the fishermen that have been caught once, the law is well enforced. Three infringers come up for trial at Mt. Holly this week. A seine drawn at the mouth of the Rancocas on Thursday night. Caught among the shad was one black bass, probably a descendant of those put in the creek three years ago. At Fairmount, on Thursday, one rod took several rock fish of about a pound, and a half and two pound black bass. The latter was at once set free. SCULLS.

VERMONT—*Montpelier, May 1st.*—To-day is the opening of the trouting season. Prospects are decidedly unfavorable, as we are in the midst of a driving snow-storm. Last winter's snow in many places is two feet deep.

W. A. B.

NORTH CAROLINA—*Morgantown, April 28th.*—I have not been out yet, owing to the unsettled weather, but heard of some 4½-pound trout being caught thirty miles from here last week, and as soon as I can leave the Post I shall try them. DOCTOR,

MINNESOTA—*Brainerd, April 30th.*—Spring has at last "come around." The pickerel begin to show themselves in the grassy shallows, and in the outlets of lakes that empty into rivers. The pike-perch will begin running soon. Speaking of fish reminds me of the frost fish, mentioned in your paper lately. We have taken them in n gillnet many times at Cedar Pond, near Meacham Lake, Franklin county, N. Y. They will not bite, at least we never knew them to. Slightly salted and smoked they are delicious. We have written Mr. Fuller, of the Meacham Lake House, asking him to send you a specimen of these fish, and a description of them, and their habits, etc.

HAVILAND.

MOVEMENTS OF THE FISHING FLEET.—Some thirty more sail have been fitted away for the southern mackerel fishery the past week, and others will soon follow. The first mackerel of the season were caught by the schooner Mary Odell, Capt. McLain, of this port, and landed at Philadelphia on Tuesday, she sold her catch fresh for $1,500.

There have been 54 arrivals of the cod and halibut fleet, 45 from Georges and 9 from the banks. The receipts of Bank halibut have been 524,520 pounds, and 135,000 pounds of Georges; Bank cod-fish, 50,000 pounds, Georges cod-fish, 900,000 pounds. Sales of halibut at three and two cents per pound for white and gray.

There have been some big halibut trips from the Banks, as follows: Schooners Carrie P. Morton, 114,540 pounds, Davy Crockett, 99,880 pounds, Edwin C. Dolliver, 95,000 pounds, Notice, 70,000 pounds, Howard, 75,000 pounds.

The schooner Gazel, of this port, arrived at St. John on the 13th inst., with a fare of 5,000 pounds of halibut, caught off Digby, which found a ready market at four and a half to five cents per pound. The fish were retailed at ten cents per pound. The St. John *Globe* says "some people wonder why American fishermen catch fish at our own doors, and supply our markets, carrying off the proceeds; the reason is the obvious one of nothing to prevent them."

Schooner Nulli Secundus sold from this port to parties in Norway, in January, carried out a load of pickled herring. The venture occasioned considerable comment at the time, and the expression that it seemed like "carrying coals to Newcastle," was freely made use of. The herring, however, met with a good sale, and Messrs. D. C. & H. Babson, who sent the first load, have now fitted their new schooner, the Herman Babson, under command of Capt. Lawson, on a similar voyage. She sailed yesterday.—*Cape Ann* (Gloucester) *Advertiser, April 29th.*

METAPHYSICS OF FLY FISHING.

We continue this week our studies on the Fly Fisher's Entomology—a branch of education most essential to success in angling, though little understood or appreciated. We claim that no man can become an expert and successful angler until he has acquired some knowledge of entomology either through his own observation or the experience of others. The subject matter of these articles we believe to be altogether new in the Angling Literature of America, and certainly reflects much credit upon their author, who shows herself to be a patient and close observer:—

"Insects are the scavengers of nature. They seek fetid unwholesome matter, the germ cells are left, and the corrupt mass is the birth place, home, and sepulchre of myriads of animate life. Noxious miasmatic gasses are consumed, purity takes the place of foulness, and the whole, cleaned at the appointed time, has the appearance of a miniature resurrection. Not only is the earth cleansed, but the water is purified. The flora that spread out their arms expands and grows in rich luxuriance beneath the water without fear of drought or a sigh for rain, all kept clean and pure by the infinite hosts of species that sport in the water. Their nourishment is decaying vegetation and that disagreeable substance on confervæ formed by the decomposing action of the water. The majority of aquatic species, and those species that appear in the greatest numbers are these indirect vegetarians. I am aware that this is a strong statement, and one never before advanced. It is the result of years of patient watching and studying. Of the class of insects whose larvæ feed in this manner there are, in the section *Neuroptera*, the *Ephemeria*, all of the *Phryganina* that live in cases, several species of Ialina. Many species, but divided among different families in the section diptera. One of these, *Pisces simulinæ*, received its fishy name in honor of the commotion it created among pisciculturists, a few years since. It figured in Fish Commissioners' reports, etc., as a "web worm" and "destroyer of young trout." Larvæ are ravenous feeders. A stream must be rich in confervæ to have a large insect fauna. It would be well sometimes before stocking streams with fish to stock them first with insect food. Not that insects are the only fish food, but directly and indirectly they form the main supply at all seasons, and almost the exclusive food when the *Gammarus* and other crustacea are passing through the first stages of life. Insects are liable to be exterminated in streams, or new species take the place of the old ones; floods and freshets sweep the flora away. Mineral matter is obnoxious; or their parasites and enemies may gain the ascendancy. New species may supplant the old inhabitants, not always "the survival of the fittest," but the survival of those whose enemies and parasites are held in check from a combination of circumstances.

The dragoon flies (*Odonata*) take the front rank among water insects. In described species they exceed in number all the remaining families in the section *Neuroptera* whose birth-place is the water. The majority are in the warmer latitudes. They have a preference for the waters where the temperature increases during the summer months. In springs and mountain streams the larvæ will be found hugging the bank and in shallow inlets. They hibernate in the egg form, at least in the northern latitudes; are voracious predaceous feeders; are sporing characters, whose life at all times depends on their agility in pursuing and capturing game. Their large size, as well as their habits in flying in pursuit of food, keeping high over the water, will always prevent their imitations being used successfully as bait on small streams. They are rapid in their movements, but easily tire, and where there is a large expanse of water their imitations can be used with good success. In such waters there is always a larger sized class of fish, making strong, heavy tackle essential.

The next family the section in predominant in species, and each species predominant in numbers, is the *Phryganina* —meaning a fagot. For various reasons this family should claim the particular attention of the fly-fisher. It belongs almost exclusively to the northern latitudes, and particularly to that class of waters where the trout and grayling delight to sport. It is of medium size, the alar expanse of the largest specie not exceeding two inches. From the numbers of species, and their diversity of habits, they make their appearance at all seasons. The imagines have a moth-like habitus, and are called "stone flies" on account of their colors resembling that of stones. The wings are black-brown, black shading through the browns, the brick colors, the luteous, until a creamy white is reached. The eggs are inclosed in gelatinous capsules which swell in the water and attach themselves to stones, sticks, or vegetation. In this mass the young live for some time after being excluded from the egg. On leaving it they fasten around their body leaves, grass, or any soft substance forming a padding, and then at their leisure build a regular case around the whole, some spirally, others longitudinally, of pieces of wood, grass, roots or branches of plants, gravels, stones, shells, or any small and available substance found in the water, adding on as they increase in growth or statue. The appearance of these cases is as various as the species. Some take possession of hollow reeds or straws; others spin a case of silk exclusively. These cases protect the abdomen, but are so large that they can retreat entirely within when disturbed. They cling to them with hooks at the extremity of the abdomen. Learned hydrostatics as they naturally should be, these cases are built with specific gravity, such that it does not discommode them as they walk, or buoy them to the surface. The few species in this family that are predacious do not live in cases, but take shelter under stones or sticks, or spin a small web under some protection that they abandon at pleasure. When fully fed and ready to change to pupæ, they close their case with a grating, first fastening it securely to some substance in the bed of the water. Those that do not live in cases, make a pupa covering of decayed wood, or small stones. When this metamorphose is completed, and they are ready to leave the water, they make with their mandibles a semicircular incision in their covering, the head and the two first pair of feet are thrust out, the rest of the body is partly drawn and partly wriggled out. Now, as in the larvæ form, they swim by using their feet, and make their way with dexterity to the shore. In doing so I have seen them swim across the stream, a strong current tending to carry them down. In their struggles they would be part of the time on the surface and part of the time under the water. When they secure a lauding place their appearance is somewhat peculiar. The mouth parts, or a portion of them, and the two first pair of feet are free, while the posterior feet and antennæ are oppressed to the sternal surface, and over them the wings are folded, crossing at the points. In ten or fifteen minutes after leaving the water they cast off a thin parchment like covering, thus releasing all parts of the body. They leave the water just before twilight, but will be seen fluttering over the water at all hours. In the evening some fly in dense swarms over streams and ponds. Many are nocturnal, flying only at night. They leave the water in June, July, August, and September. A few species in the late fall; a few on warm days through the winter; and some in the early spring, but not in sufficient quantities to warrant their use as bait. The forms that have been imitated the most, are named familiarly: Stone, dark stone, gray stone, black June, general hooker, hod, wren fly, raven, kingdom, preceptor, and goveruor.

The cow dung fly, (*Scatophaga stercoraria*), so named on account of the larvæ feeding in the ordure of cows, belongs to the section *Diptera*. It hybernates as pupæ, buried in the earth. It bursts open the chrysalis and comes forth the first warm days of May. All the authors advise the use of this fly as bait on windy days, thinking it was the wind that brought it to the water. It might be, if the wind always blew towards each individual stream. It was, I know, a successful and popular bait for all streams, but why, it was for a long time a puzzle to me. I was at length so fortunate as to solve it. The females are short lived and seldom leave the vicinity of the food for the young; their imitations are seldom used as bait. The males live until they are chilled by the cold winds of the fall. They are greedy feeders, epicurean cannibals, feeding on their smaller sized cousins, fresh and juicy, catching them just as they are leaving the water. They hold them with their anterior feet, fly to the bank, and sitting under the shade of a leaf, suck the body dry. One evening I watched one of these flies supping six on simuliums; not being satisfied he made a trip to the water for another, but there was a trout in waiting and he sank to rise no more. The flies can be used successfully as bait at all hours. They have a double advantage, their colors approximating so closely to several species of *Phryganina* that they may be considered as representing three or four different insects.

The Black May is one of the favorite forms in the same section as the proceeding. There are species having these colors at all hours and all seasons on the water. In some the ventral surface is clothed with a shaggy gray hair. These walk or glide over the surface of the water with remarkable rapidity, and have a decided dislike to leave it.

The *Ephemerina* named for April will appear in May on mountain and tributary streams, on all the streams that remain open during the winter. They hybernate as active larvæ and pupæ, and if ice were formed, or partly formed, they would perish.

In addition to this section, there is the great dun (*Baetis longicauda*), and its image, the red spinner. The latter in form and color approximates so closely to several different species that it has been used successfully throughout the summer. The yellow May (*Cocon striata*), appears usually about the middle of May and continues through June.

In my last I omitted to mention that the grizzly king, queen of the water, and professor, had a classical history. The two first are the invention of Prof. John Wilson—Christopher North of the "*Noctes Ambrosiana*." The last the invention of James Wilson, the eminent naturalists, the stock of the chaldeean manuscript. The three champions of the stream, may be classed as belonging to the Wilson family. To continue the list of general summer flies, forms that have made for themselves a name and history, but without prototypes in nature. There is coachman, king of the water, gold spinner, captain, soldier, kingdom, and the black, brown, red, and gray palmers.

SARA J. MCBRIDE.

IMPORTANT.—Care should be taken in buying fishing or Hunting Suits to get a genuine Holabird Suit and not one of the worthless imitations which are being put on the market. The best is the cheapest.—Adv.

PICKEREL IN ADIRONDACK WATERS.

GREENWICH, New York, April 27th, 1876.

EDITOR FOREST AND STREAM.—

In one of four late issues, (April 6th, I think), E. K. Wilson, writing from Syracuse, says:—

In 1865 a lot of these "fresh water sharks" (pickerel) were let loose in Long Lake, to the indignation of most of the residents, and all of the sportsmen. For a few years Buttermilk Falls opposed a boundary for their influx into Racquette Lake. In 1869, through the instrumentality of some of "Murray's horde," they were transported over the falls, and from thence have spread throughout that pride of the North Woods—Racquette.

This is true of the Long Lake waters, and down stream from that lake, but I, for one, do not believe pickerel appear above Buttermilk Falls. Next above Long Lake and Buttermilk Falls, on Racquette River, comes Forked Lake, four or five miles long, and I never heard of pickerel in the Forked Lake. As to Racquette Lake, truly called "the pride of the woods," I have fished its waters for ten years, sometimes spring and fall both, and I never heard of, or caught, or saw pickerel there. Nor did I ever till now, hear any person say that pickerel had ever appeared above Buttermilk Falls, much less in Racquette Lake. I know nothing of Mr. Murray, save by hearsay, in the Adirondacks, and general repute as a clergyman, having never seen him, but I believe him to be quite too much of a sportsman to ever himself entertain or tolerate in any of his "hurdle" the sacrelgious idea of carrying pickerel around the falls, and thus introducing them into Forked Lake waters, and thence into Racquette. Until further evidence I shall disbelieve entirely these statements. The evil effects of these miserable pirates have been fully felt in Long Lake, and the man who would spread them any farther in the beautiful waters of the Adirondack lakes is a wretch—and a deliberately wicked wretch.

D. W. MANDELL.

FYSSHYNGE IN YE OLDEN TIME.

MILTON, April 25th, 1876.

EDITOR FOREST AND STREAM:—

As everything now is Centennial, I send some extracts from the diary of an old fisherman of the Neponset River a century ago:—

June 6th, 1769.—Caught 1,500 shad in one day in the seine.

June 10th, 1771.—Caught 2,000 shad in one day in the seine.

May 4th, 1772.—Caught 61 shad.

May 8th.—Caught 560 shad.

May 11th,—Caught a very large haul of shad, 15 barrels.

May 21st.—Caught 21 bass and 16 shad.

June 2d.—Set our seine at Pope's Point and caught 39 bass.

June 25th, 1772.—We made the largest haul of fish; caught 6,000 shad, menhadin, and bass.

July 2d.—Carried 80 barrels of shad to Boston.

May 4th, 1773.—Caught 140 shad and two cod-fish.

May 5th.—Caught 300 shad, three bass, and one cod-fish.

June 14th.—Made a large haul of shad; caught 4,000; sent 40 barrels to Boston.

June 6th, 1774.—Set the seine; made a great haul; caught 3,000 shad.

June 18th.—Caught 800 shad.

June 23d.—Stopped at Pine Neck Creek; caught 200 shad and 11 bass.

There were fishways in these days. I have the pleasure of having a herring on my desk, as I write, that went up the fish-way here, and was taken in the pond above.

GEO. S. ESTEY.

BAMBOO RODS.

EDITOR FOREST AND STREAM:—

Stockhardt, in speaking of the siliceous plants, of which the bamboo is one, says: "Silica is to these plants what bones are to men—the substance to which the stalk owes its firmness and stiffness. If the soil deficient in soluble silica (or if there is not enough potassa which renders the silica soluble) these properties will be wanting to the stalk and it will bend over." Now there are two parts of the bamboo cane which are valuable in making split bamboo rods; first in importance, is that tough mass of horny fibres, which by the increasing compression of its growth has attained to its utmost density immediately under the enamel, and which as endogens, have their "heart-wood" on the outside, may be called, to distinguish it, the heart of the bamboo; and there is the enamel itself—the case—hardening as it may be termed, less than the hundredth part of an inch in thickness—almost pure silex—hard enough to turn the edge of the keenest knife, and which, according to the great German chemist, quoted above, gives firmness and stiffness to the whole.

I am thus particular in drawing the distinction between these two substances, differing essentially in their nature and uses, yet perfectly harmonious in their relations to each other, as some of your correspondents appear to labor under the impression that they are one and the same thing, or, which is perhaps more probable, having given the pretty name "centre enamel" to rods containing no enamel whatever, they are driven by the exigencies of their case to call the heart-wood of the bamboo by that name, when the slightest acquaintance with Noah Webster would have taught them their error.

Thus W. J. P. builds his rod—on paper—fitting the splints together in a manner which necessitates the removal of all the enamel and claims that all of it is retained. J. B. C. in his four split plan, represents the enamel as nearly an eighth of an inch in thickness, showing that he has also fallen into the error mentioned above. W. says "File the enamel side of your strip enough to make it fit properly," and at the first touch of the file away goes his enamel. Now as J. B. C.'s plan as illustrated in your paper of March 30th, is essentially the same as those of your other correspondents, differing only in the number of splints used, and as this is offered as an improvement on Natures process for obtaining strength and elasticity, let us examine them side by side and see if he is correct. In the first place the principle that "a chain is no stronger than its weakest link," is perfectly true as applied to a chain, and if the fly rod were to be used for pulling fish out of water in the manner of a boat or gaff hook, then it would follow that "the same amount of enamel outside or inside would produce equal strength," but as we do not use our rods in that bungling manner, the chain simile does not apply at all. The mechanical principle which does apply to the rod, being that of the hollow column as suggested in my previous communication, and aptly illustrated by H. in your issue of last week.

It is a well established fact in mechonics, that metal cast in the shape of a hollow column is vastly stronger than the same metal cast in any other form of the same length. Now as in the out-side enamel rod, the tough portions of the cane form a column surrounding the weaker portions in the centre, and as in the so-called "centre enamel" rods, the principle of the column is deviated from, it must be evident that the former will make a stronger, and consequently more durable rod. I have already shown that the name "centre enamel" is a misnomer, and that there is no enamel retained in those rods. As apart from the fact that glue, even with the addition of borax, will not stick to it any more than it will to any other smooth piece of flint, the roundness of its surface unfits it for any other place than the outside of the rod.

If the heart-wood of the bamboo were homogeneous as claimed by Mr. Clay in your issue of March 30th, the plans presented by your correspondents would make very good rods, but as it is of graduated density, a transverse section would present alternate layers of dense and less dense wood. These running lengthwise of the rod would hardly conduce to that accuracy of casting in every direction, that "proper and equal flexibility," which is claimed for them. To illustrate, take the ferrule of a six split out side enamel tip between the thumb and finger of the right hand, allowing the extreme point to rest on the ground, and applying just sufficient force with the finger of the left hand midway on the tip to give it a gentle curve—now roll the ferrule between the thumb and finger, and notwithstanding the curve, it will run as smoothly on its centre, and as truly, without twists or jumps, as a piece of shafting driven

by an engine. A transverse section of such a tip would present the appearance of a wheel, to borrow Mr. Clay's simile, revolving on its axle with the felly represented by the heart-wood and the tire by the flinty covering or enamel, both on the outside, where they should be. While a section of his tip would resemble a wheel indeed, inasmuch as it is round, but a wheel without felly or tire running on its spokes.

In the discussion of this subject, I have carefully avoided mentioning the name of any rod maker, either to praise or condemn, supposing that it was a principle of construction, and not the merits or demerits of any particular manufacturer, at issue, but I should like W., who appears to have taken up cudgels hotly in advocacy of his favorite maker, to explain wherein the four objections raised by H. are "imaginary," or unsound, and also to inform us whether the same natural laws do not apply in the making of fly rods as in any other purely mechanical operation.

TED GRAYSON.

Yachting and Boating.

All communications from Secretaries and friends should be mailed no later than Monday in each week.

HIGH WATER, FOR THE WEEK.

Date.	Boston.		New York.		Charleston.

May 7	10	41	7	38	6	44
May 8	11	22	8	5	7	22
May 9	morn.		8	48	8	3
May 10	0	3	9	32	8	46

A NEW REEFING GEAR.—MR. E. D. RANKIN has invented a new sail bending and reefing gear, which combines simplicity with economy, doing away with standing reef points and earings, and permitting a sail to be reefed without a man going on to the boom to reeve the earing. A working model of this new gear will be on exhibition at the Centennial, and we learn that the owners of several new yachts now building in this vicinity have adopted it.

BROOKLYN YACHT CLUB.—A special meeting of the Brooklyn Yacht Club was held last week. The Regatta Committee reported in favor of changing the date of the spring race from the 22d of June to the 10th of that month. When the 22d of June was named it was not known that the Centennial Regatta Committee had named the same day for the Centennial race. The report of the committee was unanimously adopted and the 10th of June named as the day for the spring regatta. Captain R. H. Huntley was unanimously elected as a member of the Board of Trustees. Mr. Henry Hentz was elected as a member of the Regatta Committee. Captain Thomas Lord, Jr., was elected a member of the club, and on motion an adjournment was taken.

BOSTON YACHT CLUB.—The annual meeting of the Boston Yacht Club was held Wednesday P. M. 26th inst. at the club house at City Point South Boston, and there was a large attendance of members. Commodore Benjamin Dean presided, and in his annual report, after expressing a desire to be relieved from further service in his present capacity, congratulated the club upon its continued and increasing prosperity, both financially and otherwise. Four years ago there was but 78 members, and now there were 269. There are more yachts now connected with the club than there were members at that time. His report also referred to the great stride of improvement in the sparring of yachts, especially in the introduction of hollow masts, top-masts and gaffs and gaff topsail luff poles. The masts of his own yacht—the Fanny—first weighed 320 pounds. He substituted iron, which brought it down to 240 pounds, and now he had reduced the weight to 180. Commodore Dean also referred in appropriate terms to the death of Mr. Geo. F. Homer of Brookline and Capt. Ezra H. Baker of Boston, members who had deceased during the year. Some of the officers having declined a re election, the following were selected for the ensuing year: Commodore, Arthur Chency; Vice-Commodore, F. H. Peabody; Rear Commodore, Andrew Robeson, of Fall River; Secretary, Thomas Dean; Treasurer, Augustus Russ; Trustees, Screno D. Nickerson, Thomas Manning, Benjamin Dean; Measurers, D. J. Lawlor, Boston, J. B. Smith, New Bedford; Regatta Committee, Coolidge Barnard, B. Chase Dean, F. E. Peabody, William F. Halsey; House Committee, Commodore *ex officio*, D. B. Curtis, C. E. Russ; Members' Committee, Commodore and Secretary *ex officio*, A. C. Martin, C. E. Russ, William F. Whitney. A committee was appointed to take into consideration the subject of a new club house on one of the islands. The Great Brewster is likely to be the locality selected.

ENGLISH OARSMEN FOR AMERICA.—At a meeting of the Captains of the various college boating clubs at Oxford on the 1st inst. the invitation to participate in the Centennial regatta at Philadelphia was discussed and referred to a committee. There was a feeling in favor of accepting the hospitality of American oarsmen, provided Cambridge and the Dublin University also send representatives. The *Daily News* of the same date states that at the meeting of the Oxford Boat Club Captains the invitation of the Yale University boatmen was respectfully declined.

SCHUYLKILL NAVY REGATTA.—The Schulkill Naval Board at their meeting to night fixed the Local Regatta for Saturday, June 17. The programme comprises races for four oared gigs; six oared barges; single, double pair oar and four oared shells. The gigs and barges will row one mile from Rockland and return; the shells from the Falls one and a half mile down. The prizes will be the usual champion flags for each class, and special flags for the winners.

The Commodore received a letter on Saturday from New York assuring him that the International Regatta Committee may rely upon the boating men of your city for a subscription of $5,000 for the Regatta Fund.

The amount requisite for the purses for the professional races is now almost assured, and the amounts ought to be announced at once. The Centennial Commissioners have recognized the efforts of the Committee to add to the attractions of the great celebration by sending them invitations to attend the opening ceremonies on the 10th of this month. SCULLS.

THE INTERNATIONAL BOAT RACE.—The managers of the Centennial Regatta are assured that the following oarsmen will compete in the professional races for $8,000 in prizes and the championship of the world: English crews from the Thames and Tyne, Colonials from Halifax and St. John, the Faulkner-Regan crew from Boston, the Biglin crew from New York, the Ward crew from Cornwall, and the Scharff crew of Pittsburg. The English crews, the St. John, Halifax, Ward and Biglin crews will row in the pair-oared race, while in the single scull race there will be Bagnall, Boyd, Higgins and Sadler from England; Coulter, Scharff, Ward, Engelbardt, Plaisted, Biglin and Ellis Ward.

—The race between the crews of the Bostou and City Point clubs to be rowed on the Charles River, Bostou, on the 6th instant, is exciting much interest. Each have been in careful training, and a fine race may be looked for. Reagan, the stroke of the Boston four, has a very sore hand, and has not pulled with his crew since Monday last, and the probabilities are that he will practice but little before the race. The Boston crew has recently had a new boat built for them weighing about 140 pounds, and is said to be a good one.

—In anticipation of the coming season, and encouraged by the large number of visitors last summer, Mr. Joseph Cailly will have on hand a fleet of boats and a few yachts at Waubashene, Canada West, for the accommodation of sportsmen and fishermen who shall chance to visit that portion of Georgian Bay. A yacht course, two miles long, has been laid out at Lake Conchiching (Muskoka), Canada, for regattas to be sailed next summer. Mr. Scully will run the Conchiching Hotel the coming season.

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

G. M. FAIRCHILD.—A letter for you at this office.

J. S., Midway, Ky.—What is the cost of changing a pin-fire gun to a central fire? Ans. About $20.

JAMISON.—What can I buy a full set of Audubon's Birds of North America? Ans. Write to Wm. Brewster, Brattle st., Cambridge, Mass. Price $100.

A. E. & Co.—Are there any flounders growing to the weight of 4 pounds in this section of the country? Ans. Yes; you can see them often on the slabs at Fulton Market.

THOS. WILLIAMSON, Leesburg, Va.—We should be glad to see your "bird and game diary," and take from it such facts and extracts as we considered valuable. Such notes are always good.

CANARY, Swampscott, Mass.—Holden's Book on Birds, 128 pages and 84 illustrations, is full of information on care of all cage birds; 25 cents by mail, postpaid. Address George H. Holden, New York Bird Store, 9 Bowdoin Square, Boston.

W. G. E., Bockford, Ill.—Are F. Perkins, London, Eng., and B. T. Hart, New York guns good and reliable? Ans. The former we know nothing of. We have frequently observed the latter name on guns, but question if there is such a maker.

PAXTON.—Will cork, say ½ inch deep, answer instead of Eloy's thick felt wads (I believe it would on account of filling the paper shell)? Ans. Cork is now used in filling rifle shells where the charge does not fill the case; the principle objection to them in a shot gun would be the expense.

J. C. E., Concord, N. H.—Will you please inform me where I can get a good map of Maine? Ans. At Colton's, 172 William street, N. York. The "Guide to Moosehead Lake," published by T. W. Ripley, 138 Congress street, Boston, contains a good map of Northern Maine from official surveys.

BOUNCE, San Francisco.—Can you inform me if the New England and New Hampshire State Fair of September, 1875, have presented the prizes awarded at the Beach Dog Show, and if so, to whom shall I apply for the same? Ans. They have, and your prize was sent to your former place of residence.

C. E. C., Franklin, Pa.—1. Is the Remington breech loading shot gun full choke bored? 2. Can Kay's concentrator be used in choke-bored guns? 3. Is the Snider breech-loading shot gun choke bored? Ans. 1, No. 2. They could be, but there is no necessity for it, both being concentrators. 3. Not unless so ordered.

G. A. A., Hillsboro, New Brunswick.—Would you be kind enough to let me know the address of the maker of Colvin's canvas boat, and also, if possible, the cost of one? Ans. Made by R. A. Scott, Albany, N. Y. Cost originally, $40; perhaps less now. Eston, Holberton & Co., 102 Nassau street, this city, sell them.

J. H. C., Hartford, Conn.—I have a double barrel breech-loading shot gun No. 12-bore; weight 7 pounds. Is there any reliable rule for loading shells for such a gun? I have loaded with 2½ to 3 drs. black powder to 1⅛ oz. shot, No .8. Would a less quantity give more force and be as effective? Ans. Use 2¼ drs. of powder and 1 oz. shot.

DOCTOR, Morgantown, N. C.—Is there any light water-proof wading stocking which will keep one dry and allow a pair of heavy-soled shoes to be worn over it? What is the cost? Ans. Buy the English Mackintosh wading stockings of Conroy, Bissett & Malleson, 67 Fulton street, New York; price $8. The trowsers that come to the hip cost $18.

SOMERSET, Addison, Pa.—1. Where can I purchase a paper sporting boat with capacity for two persons and baggage? 2. Can you refer me to any person who would exchange a setter, broken, for pheasants, or a cocker (unbroken), for a pair of yearling fox hounds of good stock? Ans. 1. Possibly of Thomas Fearon, Yonkers, N. Y. 2. We cannot, but perhaps some of our readers can.

SOUTH FORK.—When and where will the next Field Trials for setters and pointers be held in this country? To whom can I apply for full information as to place of conducting the same; the points awarded for certain qualifications of dogs? Ans. At Memphis, Tenn., in November next. For full particulars address D. Bryson, Esq., Secretary Tennessee State Sportsman Association, Memphis.

F. J., New York.—Will you please inform me whether you consider my rifle a good one. It is a Ballard, patent 1875, round barrel, .41 cal., rim and central fire, cost $35; was rather hasty in buying and find there are streaks in the barrel that look like scratches, but it can't be that, for it hasn't been used. Ans. Your rifle is undoubtedly a good one. The scratches may have been made by a wire cleaning brush.

O. F., Aocram, N. Y.—Do you think a young dog (setter) of six months too young to commence hunting on woodcock? I have one that will be six months to July next? Ans. We have frequently commenced shooting over six-months old pups, and soon got them to work and point steadily, but to give a pup of that age continued hard work would probably make him slow—some work will make him good.

C. W. B., N. Y.—Will you please inform me through the "Correspondent Columns in FOREST AND STREAM, what will prevent the hairs of a white spitz dog from falling out? If the dog requires any medicine please let me know what it is and where I can procure it? Ans. Keeping a dog in the house, and in a warm place, causes the hair to fall off. But if your dog is out of health, we can send you a remedy.

JOHN, Boston.—Will 100 grains powder burn in a 26-inch, .50 cal. sporting rifle; if not, what is the maximum charge, and how heavy ought the rifle to be made to prevent too severe recoil? Ans. We should think not, as 70 grains is about the maximum. In the Government carbine, 2 inches shorter, 45 grains is the regulation charge. An ordinary ten-pound rifle, with a charge of 100 grains, gives a recoil equal to 100 pounds.

D. M. DUNBAR, Baldwinsville N. Y.—What is the probable cause of some birds varying so much in plumage from the rest of the family? Ans. Your question is vague. Albinism and melonism are the result of a diseased state of the pigment or color cells in the skin, hairs or feathers. Many variations are the results of geographical and climatic conditions, the laws of which are discussed in recent essays by J. A. Allen, Prof. Baird, and Robert Ridgway.

A. M. N., Santa Rosa, Col.—1. Do the members of the Milwaukee Rifle Club confine themselves to the use of any particular gun? 2. What would be a proper bull's-eye for 200 yards off-hand? 3. Can accurate shooting be done with simple sight at a range of 200 yards? Ans. 1. No; we presume not. 2. 8 inches. 3. Yes; some of the best rifleman, Maj. Shonnard for example, have found that they can do better off-hand shooting with open sights than with peep and globe.

T. M. DeR., New Brunswick, N. J.—To settle a dispute, please answer the following question: Have shad been taken with hook and line, and if so, what bait was used? Ans. Many shad have been taken with rod and line and artificial fly in the Connecticut and other rivers. Robt. O. Gates, Esq., of Derby, Conn., informs us that he has taken shad frequently from the Housatonic River, near Derby, with angle worm, which is news to us and a fact that may be regarded as important.

R. L. W., Mansfield Valley, Pa.—Is there more than one edition of Stonehenge on shooting, if so what is the last edition, and the year it was published in? Where can I get the American Turf Register and Sporting Magazine, new series, Vol. VI, 1841, and Audubons Ornithological Biography, 5 vols.; also Porter's edition Hawker on shooting? Ans. Stonehenge's Shot Gun and Sporting Rifle was published in 1862; there was an edition of his Encyclopedia of Rural Sports published in 1857. You will have to advertise for the other books mentioned.

ROUNDABOUT, New Hope.—Last week in your reply to "Tohawa," as to the route to Blue Mountain Lake in the Adirondacks, you omitted to give distances. Be kind enough to do so and oblige. Ans. North Creek, the terminus of the Adirondack Railroad, is sixty miles from Saratoga; thence stage five miles to J. Eldrige's hotel at North River; thence stage, good road, fifteen miles to R. B. Jackson's on Cedar River; then hire a team ten miles to Blue Mountain Lake. Last year $3,000 or so were expended on this last ten miles to Blue Mountain Lake, and when it is dry the road is good.

F. H., Biddeford, Me.—Why is it that I cannot keep small brook trout in my aquarium tank, which is supplied with constant running river water? I have put them in four times the past winter and spring, and every time they have died in a few days. Is the river water too cold for them? Tank is cast iron frame, glass sides. Ans. You need some algæ in your tank. Put in rocks, gravel and water plants that are suitable. See Livingston Stone's book, entitled "Domesticated Trout," Osgood & Co., Boston, and Seth Green's pamphlet, published by D. M. Dewey, Rochester, N. Y.

H. M. H., Philadelphia.—Will you give me some information about portable boats, to be used for camping out? What is the Colvin or Ampersand boat advertised by Eaton & Co., in your last issue? Who is the maker and where can I get a circular of it, as I want more information than is given in the advertisement. If there is no circular made, please state shape and relative merits of it and Hedgeman's boat? What has become of Hedgeman's boat? I have not seen it advertised lately? Ans. See answer to G. A. A., this week. See also FOREST AND STREAM, Vol. V., No. 3, August 26th, 1875. We have mailed you a copy.

E. P., New York.—Is there anything better than parchment for fly-books, and chamois skin for the inter-leaves? Ans. We don't know of anything in use, but have been tempted to try oil silk inclosing thin card-board. The objection to parchment is that it becomes misshapen and warped after being wet. Two pieces of oil cloth, such as is used for covering wagon seats might answer, pasted back to back. Has any one to your knowledge tried thin plates of cork to lay flies on? Ans. Have not heard of cork being used. There is a recent invention of cork plates glued upon both sides of a linen fabric, but we hear it spoken of adversely.

S. K. W., New York.—Will you kindly inform me whether the Kay concentrating cartridge can be used to advantage in loading with buck-shot? I have a 10-bore breech-loader, marked E. Bond on the locks. Is there such a maker, and has he a good reputation? In one of the barrels there are one or two small flaws. They are in the inside only and look like cracks. I am told that they are in all guns, except very high-priced ones, and that they do not affect the safety in shooting. Is this so? Ans. 1. Yes. 2. Yes; Bond is a maker of good repute. No guns should have such flaws as you describe, but they may not affect the shooting of your gun.

TURNER, Grand Rapids, Mich.—Our fellow citizen L. S. Hill, has invented and filed application for a patent trolling spoon, of which the inclosed is a specimen. If you agree with me in opinion as to its merits, you will confer a favor on a worthy mechanic as well as upon the fishing fraternity, by giving it some notice in the FOREST AND STREAM? Ans. There have been so many changes rung upon trolling baits already, that it is hopeless, that an application for a patent will be recognized in the present case. We have this day examined all the styles in market, and find that this differs in no essential particular from the rest. It is a good spoon. The spring appliance was in use years ago.

G. L., Rogue Island, Me.—As we who live here require a long-range gun that will shoot 75 or 100 yards, can you advise me what to buy? I want a double-barrel breech-loader that will carry a heavy load, for the birds are sometimes to large flocks. Shall I buy a choke-bore, or use a common bore with concentrating cartridge? Whose make, and what kind would you recommend? 2. Has any one ever published a book on boat building? I want to know how to shape, build, and rig the different kinds of boats. Ans. 1. We should recommend a cylinder bored gun, in which concentrators could be used when desired. The advantage it would possess would be in flock shooting, where close shooting is not desirable. 2. No American work; Vandordecken's "Yacht Sailor" (English) is the nearest approach to such a work.

NORFOLK, Norfolk, Va.—1. Will it be prudent and safe to shoot 4 drs. Hazard's No. 4 Ducking Powder and 1¼ oz. or 1⅛ oz. shot with Eley's shot concentrator, in my 13-gauge, top-lever, single bolt, rebounding hammer, breech-loading shot gun, 30-inch barrels, weight of gun 7 pounds 8 ounces, marked Wm. Moore & Co., London, laminated steel; came from Schnyler, Hartley, & Graham, of New York, and cost here $100 at retail three years ago? 2. Expecting to be on the Ohio River in Union County, Kentucky, next fall, I wish to know the nearest point to that locality where I can confidently rely upon getting two weeks really good prairie chicken and duck shooting at any time from September 25th to October 15th? Ans. 1. Yes; you should shoot this charge with impunity, although your shoulder may suffer some. 2. We cannot speak as to the locality, but probably some of our correspondents in that vicinity can supply the information.

C. B., Gambier, Ohio.—1. Please answer through your next paper what is the best artificial fly for black bass and perch, and where can I get it, and what is the price? 2. Give me a receipt for making water-proofing suitable for a canvas boat, and is common heavy duck suitable for a boat? Ans. 1. The Ferguson fly is much esteemed by Potomac and western river bass anglers. It is a very good fly, the prominent colors being brilliant greens, scarlet, and orange. The Page fly, much in vogue at the Rasp, has scarlet wings with guinea fowl scapulas. Our experience shows that turkey browns, and mallards with a sprinkling of light purple in the wings and bodies are the most generally desirable. Most flies found at the tackle shops are far too large, and the hooks have too large a barb. A Sproat No. 2 is large enough. Cost from $2 to $3 per dozen. 3. We printed a third of a column recipe for water-proofing in our issue last week—which see—page 181. Hegeman's boats are made of heavy duck without any water-proofing whatever.

☞ A large number of "Answers" are unavoidably left over.

FOREST AND STREAM

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCULCATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,

[POST OFFICE BOX 2832.]

123 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty-five per cent. allowed for five copies and upwards.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent.; over six months, 30 per cent.

NEW YORK, THURSDAY, MAY 4, 1876.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Editor.

WILLIAM C. HARRIS, Business Manager.

CALENDAR OF EVENTS FOR THE COMING WEEK.

THURSDAY, Mar 4th.—Racing: Nashville, Tenn. Trotting: Washington, D. C. Base ball: Hartford vs. New Haven, at New Haven; Chicago vs. St. Louis, at St. Louis; Louisville vs. Cincinnati, at Cincinnati.

FRIDAY, May 5th.—Racing: Nashville, Tenn. Trotting: Washington, D. C. Pigeon match: Bogardus vs. Price, Indianapolis. Rifle: Match for Frost medal, Yonkers R. A. Kennel Club Field Trials, England. Base ball: Hartford vs. Mutual, at Brooklyn.

SATURDAY, May 6th.—Racing: Nashville, Tenn. Rifle: Luther badge, Creedmoor. Base ball: Hartford vs. Athletic, at New Haven; New Haven vs. Yale, at New Haven; Chicago vs. St. Louis, at St. Louis; Louisville vs. Cincinnati, at Cincinnati; Harvard vs. Taunton, at Taunton, Mass.

MONDAY, May 8th.—Racing: Lexington, Ky. Rifle matches: Schutzen Park, Jersey City. International Foot Ball match: Canada vs. Harvard, at Cambridge.

TUESDAY, May 9th.—Racing: Lexington, Ky. Trotting: Woodbury, N. J.; Washington, D. C. Pigeon Shooting Tournament: Kentucky State Sportsmen's Association. Base ball: Chicago vs. Cincinnati, at Chicago; Louisville vs. St. Louis, at St. Louis.

WEDNESDAY, May 10th.—Centennial Exhibition opens (?) Racing: Lexington, Ky., and Austin, Texas. Bench Show of Dogs: Lexington, Kentucky.

KENTUCKY STATE SPORTSMANS ASSOCIATION.—The second annual meeting of the above organization opens on the 9th inst., and continues over four days, including in the programme a Bench Show of sporting dogs and a pigeon shooting tournament. The Secretary of the Association, Mr. J. M. Taylor, writes us that large delegations of sportsmen from Memphis, Nashville and other parts in Tenn., from St. Louis, Chicago, Louisville and Cincinnati, will be present at their meeting. The prizes are valuable, and entries to Bench Show are being daily received. The shooting will be on grounds adjoining the Association race course, and daily, at 3 o'clock, the shooting will cease, that all may attend the races, which promise to be equal, if not superior, to any former meeting. Wild pigeons are being received, and enough will be provided to continue the meeting on Saturday, in addition to published programme. Rooms in the hotels are being rapidly engaged, and those who attend will have as much sport as could usually be found in two weeks condensed into one.

—A correspondent recommends Fort Ticonderoga, on Lake Champlain, as a desirable summer resort, especially for anglers. There is a good hotel there, and the neighborhood has many interesting historical associations,

THE WINTER FAUNA OF MT. MARCY.

THE fauna of a mountain district is usually more or less different from that of the surrounding lowlands, and the rule seems to hold that with increase of altitude and decrease of temperature a hardier and more boreal vegetation will be found, accompanied with animals common to colder and more northern regions. But in wild and elevated tracts, however abundant animal life may be, a man needs the skill and experience of an old woodsman to discover the food, homes, and pursuits of the inhabitants of the forest. The nocturnal habits of most wild animals add to the difficulty of obtaining a knowledge of them. To some aspects of the animal life of this region, in winter, Mr. Verplanck Colvin has lately called the attention of the Albany Institute, in a paper upon Mount Marcy, which he has explored in connection with the State Survey of the Adirondacks.

Mount Marcy, or Ta-ha-wus, is unquestionably the highest mountain in this State, reaching 5,400 feet. It rises sharply, and its slopes—below the bare crest of alpine rock—are densely covered with a stunted evergreen forest, the trees decreasing in size and vigor as the altitude increases. The irregular plateau, like valleys north and south, and the little mossy nooks of level land upon its sides, are the haunts of its wild inhabitants, the fauna of the coldest, the most alpine, and most desert portion of the State. On every side are huge mountains and forests. In this wild region Mr. Colvin made a careful study of all that came under his observation, but chiefly of the footprints, which he regards as the key to the history of its fauna. The study of trails enables one to ascertain the approximate altitudes at which certain wild animals exist, and by a careful classification one can show that within zones of different altitudes are found associated animals which belong to similar zones of cold, in higher latitudes. If snow be the criterion, Mount Marcy has barely two true months of summer. The summit is often whitened with it as late as the beginning of July, and the 1st of September rarely passes without a temporary covering of the crest with snow. It is safe to assume that the climatic winter of the summit begins at the latter portion of September, and ends in June.

A list of the species of animals and birds observed is given, of which we can only make brief notes. The first one mentioned is the panther (*Felis concolor*), whose tracks were often seen. The panther not only fed on deer, but was found to pursue even rabbits. The guides believe the panther to be very local in its habitation, constantly returning to the same lair. Next in importance to the panther in the list of species, the trails of which were observed, is the gray, or Canada lynx (*Felis canadensis*). Its usual residence was the swamps where it hunted for rabbits. This is an animal which we might expect in a high, cold region, for to its general distribution throughout British America, even to the shore of the Arctic Sea, it owes its title of "Canadian." It is not recorded as having been met with in the State more than one degree south of Mount Marcy. One morning on Mount Skylight the party came upon the fresh trail of a fisher (*Mustela canadensis*)—Mr. Colvin says it is not a fisher at all—which was also after rabbits, with an occasional diversion for mice. Its inhabiting these mountain heights directly refutes the assertion that it does not frequent the same elevated regions as the martin. Constantly ranging, it seems to have no fixed habitation, and generally selects the night for its travels and its depredations.

The fourth of these mountain dwellers is the sable, the *Mustela martes* of naturalists. This beautiful and rare animal is abundant in the forests on the side of Mount Marcy. It here occupies a region of country which greatly resembles the semi-arctic portions of British America, and it is interesting to remark that no traces of it were found above the timber line on the open, barren sub-alpine portion of the mountain, in this respect maintaining the habits of their race, which are never found in the barren lands near Behring's Straits, though abundant in the scrubby forests margining the open. Thus this interesting little animal becomes a measure in climatology, and serves to give us as clear a conception of the relation of our mountain summits to the boreal regions of the continent, as does the better known arctic flora. Alas for the poor rabbit, as though not sufficiently persecuted, he finds in the sable an insatiable foe. Tracks of the ermine (*Putorius nove-boracensis*), were recognized in one place, but it does not appear to be common; nor were the tracks of other weasels distinctly recognized.

The persecuted hare is next mentioned. It is the widely-distributed white or varying species (*Lepus americanus*), which is very abundant and prolific in the Adirondacks. In September, 1872, Mr. Colvin tells us that he captured a living specimen on the summit of Whiteface Mountain at an altitude of 4,900 feet. It was then of an even fawn-brown color, and showed no sign of change. Early in November many already had turned entirely white, the snow having gained a depth of a foot. Their range upon Mount Marcy does not appear to extend above 5,000 feet, while upon the Rocky Mountains these hares are met with 12,000 feet above the sea. It is observable that when on the high, cold peaks the hare has changed to white, in the lowlands, which the snow has not yet reached, it will still be brown. The climate controls the change of color, which is a protective provision.

The common red squirrel (*Sciurus hudsonicus*) was found at an altitude of about 4,300 feet. The trails indicated that it was pursued and preyed upon by the sable. This squirrel there feeds on the seeds of the black spruce. A sand rat was seen but not captured. Tracks of deer-mice were observed on the slopes of the mountain at all elevations not exceeding about 4,000 feet; and occasionally the minute trail of a small shrew, supposed to be the *Sorex Fosteri*, or Forster's shrew. In many places, as described by Richardson, it would leave the surface of the snow by descending some one of the little vertical tunnels left around some small sapling. This wonderful little animal inhabits even the desolate regions within the arctic circle, as far north as latitude 67°. Richardson remarks that "The power of generating heat must be very great in this diminutive creature to preserve its slender limbs from freezing when the temperature sinks to 40° or 50° below zero." Mr. Colvin found that the shrews would not bear handling, but if untouched seemed to be able to endure the most severe Adirondack winters.

Of birds, but three varieties have left their footprints on the snows of Mount Marcy, the raven (several of which were found 5,000 feet above the sea), the ruffed grouse, and the snow-birds. An occasional eagle, hawk, or owl was seen soaring above the mountains. One day when on the summit of Mount Marcy, a flock of six wild geese were seen flying southward. This afforded, perhaps, the first opportunity of determining the height at which wild geese travel during their migrations. They seemed neither to ascend nor descend, but kept a level course, as near the true astronomical meridian as it seems possible that a bird can fly. Mr. Colvin estimated their altitude at 5,500 feet above the ocean level.

The Canada jay on the approach of cold weather descended to the valleys, and woodpeckers were not observed above 3,500 feet. Large flocks of the white snow-bird (*Plectrophanes nivalis*) were observed upon the snows around the summit of Mount Marcy, and once or twice some Laplaud longspurs.

Insects were not much observed, but during a thaw late in October, a few insects came out above timber line, among others a moth abundant in Alaska. In the spruce forests, at the foot of the mountain, many of the trees had been attacked by small beetles. These trees were the resort of woodpeckers, who seemed to have a most active interest in the insects—piercing the bark everywhere in search of them, and covering the snow at the foot of the trees with the fragments of bark.

Some features of this mountain fauna are conspicuous by their absence.

Early explorers assert that about half a century ago the moose was abundant, and the caribou, or reindeer, sometimes found on the upland barrens. They are not now found anywhere in this vicinity either in summer or winter. The absence of the deer is more remarkable, but this may be readily accounted for by the cold, barren and sterile character of the country, and attractions of the more inviting lowlands abounding in rich, juicy browse. Early in the winter the bear might have been expected, but not a single trail was seen—though within half a dozen miles in the lowlands their paw-writings in the snow were exceedingly abundant. The porcupine can have no other excuse for its absence than the over-abundance of the black-cat—its mortal enemy. The absence of the wolf may be accounted for by his general scarcity; the fox and raccoon are lovers of the warmer lowlands. The absence of the small gray hare is a little surprising; perhaps it may yet be met with. The ptarmigan, or "white partridge," is sought for in vain, and probably does not exist within the State; but would, undoubtedly, if introduced, find a livelihood upon the open or barren portion of Mount Marcy in summer, and secure sufficient support among the small dwarf timber in winter. The blue jay which was noticed frequently at altitudes of from 1,000 to 3,500 feet did not appear; nor did the cedar-bird.

It is rare that an opportunity is afforded for making such observations as these on the winter fauna of a remote district, and their value cannot be overestimated.

—We were pleased to receive a call this week from Mr. Thos. W. Webley, of the firm of P. Webley & Sons, the celebrated gun makers of Birmingham, England, who are exhibiting, at the Centennial Exhibition at Philadelphia, a large case of fine shot guns, long range rifles, and revolvers. The firm has recently patented in this country a double shot gun called the Webley-Lang, in which both hammers are brought to full cock by the action of the lever which opens the breech. Mr. Webley will be in attendance at the case during the first fortnight of the Exhibition, when he will be pleased to give any information desired by inquiring sportsmen and others.

COACHING.—Col. De Lancy Kane inaugurated the new era of coaching in this country on Monday last by making his first trip from the Brunswick to Pelham. The coach was filled inside and out, and indeed the outside seats are engaged for weeks ahead. We should like to see a coach started on a longer route, on the west bank of the Hudson for instance, running up as far as West Point. No doubt if Col. Kane's venture is as successful as it promises, we shall have other coaches running in various directions.

—The *Sun* says that a well-known lover of horses proposes, in imitation of Col. Delancey Kane, to start a four-in-hand coach from the east side of Military Park, Newark, twice a week, to pass through Bloomfield, Montclair, across the Orange Mountains, the return journey to be by way of South Orange and Roseville.

—The inebriate constantly drinks to others' good health, while he robs himself of his own.

OUR ADVERTISING COLUMNS.—The advertising columns of FOREST AND STREAM are really a curiosity in these hard times, when all business is dull, and advertising patronage is measurably withdrawn from newspapers of all descriptions. Never before in this country have so many dealers in sportsmen's goods been grouped together upon the advertising pages of one paper, be it daily, weekly or monthly; and not these only, but dealers in other lines of goods which are in daily demand. The chief reason is that our readers and subscribers are gentlemen who indulge in luxuries—gentlemen of accumulated fortune, who, like the members of the "Four-in Hand Club," can afford to luxuriate at a time when the great mass of tradesmen and buyers are pinched by impecuniosity. These are the gentlemen who pay $500 for an imported dog, $350 for an English gun, and $100 for a salmon rod. They are not in the habit of denying themselves any article of a sportsman's outfit which they may chance to covet. They are the sole patrons of our better hotels and lines of travel in hard times. They go to Florida and Europe; they visit Canada and the Adriondacks; and they overrun the West from the time the chicken shooting begins until the snow falls. They require dog collars, dog food, and dog pills for their kennels; they must have carriages, harness, horse-shoes, whips, grooms, feed and blankets for the horses, which a majority of them own; they need clothing, shoes, hats, blankets, tents, camp stores, lanterns, liquors and gloves for themselves; stores, bunting, awnings, flannel shirts and furniture for their yachts; guide-books and maps for their wanderings; comfort at hotels, and the best accommodation by land and water lines of travel; in a word every kind of apparatus and appliance, either for fishing or shooting, is in constant request, and they resort to that medium which gives them the best information in all cases. For this reason the advertisers in FOREST AND STREAM, who have tested our columns, are almost unanimous in their testimony as to their usefulness.

The following extract from a business letter of J. H. Page, Esq., General Passenger Agent of the Grand Rapids and Indiana R. R., will no doubt furnish our future advertisers with sufficient "reasons why" they should forward their favors at once. Our advertising columns were never so fresh and so full of new matter, and the additions this week of two pages to our regular issue is an indication of the good work we are doing for our advertising friends. Were we disposed we could, from week to week, fill a column or more with like testimonials:—

GRAND RAPIDS, Mich., April 18th, 1876.

EDITOR FOREST AND STREAM:—

I take great pleasure in sending copy for advertisement, which please insert from May 1st. You did us a "power of good" last year. Wish all our advertising paid as well. J. H. PAGE.

SEAL OF THE "CONFEDERATE STATES."—This historical relic is now on exhibition at Greenleaf's store, Jacksonville, Florida. It is inclosed in a handsome case, and is two and a half inches in diameter. In the centre is a fine representation of the Equestrian statue of Washington in the Capitol Grounds at Richmond. Surrounding this figure is a wreath of the agricultural productions of the South, and encircling this, on the outer rim, the words, "The Confederate States of America, 22d February, 1862, *Deo Vindice.*"

—A St. John's, Newfoundland, correspondent of the Toronto *Globe* charges that the frequent breaks in the Atlantic Telegraph Cable are caused by vessels employed by New York Stock Exchange speculators, who, in confederation with other similar scoundrels in London, arrange to purchase Atlantic Cable stock or to sell Direct Cable, and then cause the latter to be cut in order to send its shares down and the other one's up. Speculators do not cut the Atlantic Company's cable, because the Atlantic Company has several cables, so that their business cannot be stopped, whereas the other has but one.

—The Government of Nova Scotia advertises for tenders, which are to be received until 4th July next, "for the construction of a railway from New Glasgow to the Strait of Canseau—a distance of about 75 miles—with a steam ferry to cross the Strait about a mile in length, and thence Easterly to a point in Cape Breton, ou the Bras d'Or Lake, not exceeding 35 miles additional."

—The Charleston and Savannah steamers and connecting lines are now crowded with passengers returning from their winter sojourn in Florida. We are pleased to learn that both steamers and hotels are reaping a temporary pecuniary harvest, which, although but a trifle to what they expected, will, nevertheless, help them to bridge over a wiuter remarkable for the dulness of trade and general financial depression.

—M. P. McKoon, of Franklin, New York, expects shortly several litters of choice "Cocker Spaniels," which he offers for sale with pedigrees and references.

—A bear weighing 800 (!) pounds was killed last month at West Cape, Priuce Edward Island, by Capt. Hickey, which is the largest known for many a year.

—Boston people expect to eat fresh salmon all summer and to get it cheap, as a line of refrigerator cars will be run between that city and St. John, N. B.

—The Chicago *Field* modestly requests its readers not to confound it with the London *Field! "Quantum pulveris excitors!"*

The Kennel.

THE GREAT SPRINGFIELD BENCH SHOW.

THE members of the Rod and Gun Club of Springfield have reason to congratulate themselves upon the success which has attended, for the second time, their efforts at holding a Bench Show of Dogs. But one other in any way approaching it has ever before been held in this country, and that was the show at Chicago in February last. The number of entries, which at Springfield reached 362, was about equal in both places. Chicago had somewhat the advantage in having, through the kennels of Mr. Turner of St. Louis, Mr. Smith of Strathroy, Canada, and others, a larger representation of imported setters, which was counterbalanced in the case of Springfield by the largest and finest collection of pointers ever gotten together in this or perhaps any other country, and it is also a notable fact in connection with this last show that the list of entries, large as it was, was made up almost entirely of sporting dogs, there being but comparatively few of the smaller classes of pets, etc., on exhibition. The City Hall, in which the show was held, is admirably adapted for the purpose, and the arrangements in the way of boxes for the dogs could not be excelled, affording abundant space for the comfort of the dogs, as well as ample promenading room. It was rather unfortunate that, owing to a ball which was in progress, the committee were unable to obtain possession of the hall until after midnight on Tuesday, so that it was late on Wednesday before the dogs were placed and classified. It was, therefore, not until Thursday morning that the judging began, and what with the large number of entries and the delay in the appointing of the judges on the champion and special premium classes, it was late in the evening before the awards were made up—too late, indeed, to announce them to the public, or to placard the winners. We consider this to be a misfortune, as not only were the spectators deprived of the satisfaction of inspecting the winners, but one great object of the show—the instruction of the uninitiated—was lost. Of course the members of the Rod and Gun Club were not to blame for this, for the various committees worked like beavers; but the vast number of entries, together with the impossibility of getting the hall until such a late hour, upset their calculations, and threw the bulk of the work into the last few hours. We trust that hereafter Bench Shows of the magnitude of this one will be arrauged and carried out on some plan similar to the one in vogue in England, where the first day is set aside for the judging, and the public are not admitted until after the awards are made. In the present case it was not until ten o'clock at night—the last moments of the show—that the awards were declared, leaving little, or indeed no time, for those so inclined to inspect the dogs, and, if need be, criticize the action of the judges. Promiuent dog breeders and fanciers were present from New Eugland and the Middle States in large numbers; but the West was almost entirely unrepresented, scarcely a compliment, considering the assistance given by entries and otherwise from this section to the Chicago show. Dr. Goldsmith of Vermont was present with his celebrated prize wiuner Plunkett, a splendid specimen of the red Irish dog, but scarcely seen to advantage within the limits of a box, or even when led by a chain. Mr. Wm. Jarvis, of Claremont, N. H., the vigorous defender, through our columns, of the red as the true color of the Irish setter, was also on hand, with the celebrated Dick and his imported Shamrock. Dick is getting old, but is a good dog still, as any one can see who inspects his portrait in our gallery. Mr. Charles H. Raymoud, of Morris Plains, left his Pride and his Fairy at home, and relied upon native Dimity to take the rag off the bush. Mr. Theo. Morford, of Newton, N. J., was represented by a Don who, although not an hidalgo of blue blood, was yet good enough for any company. Mr. Luther Adams, of Boston, had probably the strongest team of setters to be found in this country, headed by the champion Rock. Mr. George Delano, of New Bedford, although not present in person, sent three capital representatives from his kennel. Mr. Nicholas Saltus, of Brooklyn, had Dash and imported Lill III, together with their litter of five puppies. Dr. Webb had a large delegation of pointers, representatives of his own and Mr. F. Schuchardt's kennels. Mr. S. J. Bestor, of Hartford, had his celebrated cocker spaniels entered, and notwithstanding strong opposition, carried off two prizes. Dr. S. Fleet Speir, of Brooklyn, had a pair of puppies from his Gordon stock. The local kennels of Springfield and vicinity were largely represented, and that of Mr. S. T. Hammond was successful in several classes. The veteran sportsman Ethan Allen of Pomfret Centre, was of course on hand, with several choice specimens of his well-known strain of setters, both from his own kennel and that of Mr. J. Dwight Francis.

ENTRIES.

CLASS 1.—Imported English setters or their progeny that have never taken first prize at any Bench Show.

Jessie, E. A. Herzborg, N. Y.; Ned, J. A. Larkin, Westfield, Mass.; Jack, J. Lefleur, Huntington, Mass.; Scout, Luther Adams, Boston, Prince, do.; Dan, B. F. Ricker, Brighton, Mass.; Mollie, Isaac Fiske, Worcester; Blue-blood, W. F. Parker, West Meriden; Jersey Boy, J. Van Lorgerke, Hoboken, N. J.; Trim, W. H. Balcom, Worcester, Peg, do.; Doll, Adonis, and Charm, S. Delano, New Bedford.

CLASS 2.—Imported red or red and white Irish setters, or their progeny, that have never taken first prize at any Bench Show.

Dick, Wm. Jarvis, Claremont, N. H.; Shamrock, do.; Duke, W. C. Harding, Stamford; Snipe, J. A. Barnes, Hartford; Lill III, N. Saltus, Brooklyn; Jack, Max Wenzel, Hoboken.

CLASS 3.—Imported black and tan, and black and tan and white Gordon setters, or their progeny, that have never taken first prize at any Bench Show.

Ruby, R. O. Gates, Derby, Conn.; Nello, do.; Flash, S. T. Hammond, Springfield; Kent, Isaac Fiske, Worcester; Grouse, Jerome Marble, Worcester, Mass.; Don, L. B Harding, Stamford; Daisy, W. H. Balcom, Worcester; Lou, W. M. Tileston, N. Y.; Monarch, Horace Smith, N. Y.; Speir, S. H. Strachan, N. Y.; Rake, E. Orgill, N. Y., Ruby, do.

CLASS 4.—Native setters of any strain that have never taken first prize at any Bench Show.

Fly, A. Bassett, Pittsfield, Mass.; Fly, J. Howe, Springfield, Mass.; Price, E. Lazelle, Springfield; Jim, Lieut. H. Metcalfe, Philadelphia; Trim, S. T. Hammond, Springfield; Vic, E. J. Robbins, Wethersfield, Conn., Flirt, do.; Ruck, J. Day, Springfield; Frannie, R. W. Reid, Greenpoint, L. I.; Fritz, D. F. Charles, Albany, N. Y.; Dash, J. H. Steele, Ellington, Conn., Nellie, do.; Spout, E. Allen, Florence, Mass.; Fan, Dr. S. Fleet Speir, Brooklyn, Joe, do.; Chum, Ethan Allen, Pomfret Centre, Conn., Cash, do.; Boots, L. Butler, Chicopee, Mass.; Jim, S. Scranton, Providence, R. I.; Nigger, A. T. Currier, Whitesville, Mass.; Jack, W. H. Burrall, Springfield; Pup, W. H. Burrall, Springfield; Don, Theo. Morford, Newton, N. J., May, do.; March, J. Dwight Francis, Pittsfield, Mass.; Dan, E. Van Demesker, Stamford, Shot, do.; Queen Bess, Bassett and Thompson, Boxford, Mass.; Ned, C. W. Ellis, Springfield; Black Duke, F. Warren, Springfield; Tramp, T. M. Todd, Hartford; Bess, W. H. Balcom, Worcester, Trim, do.; Dimity, C. H. Raymond, Morris Plains, N. J.; Mab, Emerson Foote, N. Y.; Phil, J. H. Gifford, Springfield; Fan, G. H. Davis, Durham, Conn.; Bluff, R. O. Gates, Derby, Conn.; Tip, Dr. F. L. Burns, Athol, Mass.; Rab, Dr. J. M. Borland, Boston; Belle, J. Nesbitt, Jr., Cambridge; Norah and Mack, J. N. Francis, Bridgeport.

CLASS 5.—Pointers of 50 lbs. weight and over that have never taken first prize at any Bench Show.

Daisy, Dr. W. S. Webb, N. Y.; Fritz, do.; Fan, P. Schuchard, N. Y., Tom, do., Ned, do.; Shot, S. T. Hammond, Springfield; Ben, do.; Spout, R. O. Smile, Springfield; Forest, J. A. Larkin, Westfield, Mass.; Dash, J. F. Harrison, Springfield; Ned, R. Richmond, New Britain, Conn.; Start, F. O. Downing, West Meriden; Pete, E. C. Bingham, West Meriden, Conn., Rock, do.; Guy, R. O. Morris, Springfield; Tip, N. H. Daniels, Huntington, Mass.; Jeff, A. F. Craig, Hartford, Conn.; Cal, C. W. Dixon, Springfield; Rip, J. E. Murphy, Springfield; Sport, A. J. Jones, Springfield; Phil, F. Stevenson, Jr., West Meriden, Conn.; Dick, H. D. Gilmore, Springfield; Jake, H. C. Toft, Springfield; Don, J. S. Fay, Southboro; Mack, J. C. Woodward, South Hadley Falls, Mass; Dan, B. C. Brainard, South Hadley Falls, Mass.; Phil, Jr., W. M. Tileston, N. Y.; Flirt, L. Miller, N. Y.; Shot, A. R. Strachan, N. Y.; Don, Rap, and Mack, J. Harburton, New Britain, Conn.; Nellie, O. B. Cooley, Longmeadow, Mass.; Bingo, W. S. Brooks, Stamford, Conn.

CLASS 6.—Pointers under 50 lbs. weight that have never taken first prize at any Bench Show.

Pat, G. D. F. Grant, N. Y.; Mab, G. A. Strong, West Meriden, Conn.; Lou, H. S. Hyde, Springfield; Psyche, C. W. Dixon, Springfield; Rix, F. Howe, Jr., Brooklyn; Grouse, W. E. Gibbon, East Hartford; Guy, J. N. Hodges, Springfield; Scout, E. H. Ladrips, Springfield; Daisy, Sanderson and Williams, Springfield; Quaker, Wm. M. Williams, Springfield; Jim, W. M. Williams, Springfield; Whisky, Dr. W. S. Webb, N. Y.; Belle, Horace Smith, N. Y.; Lew, O. B. Cooley, Longmeadow, Mass.

CLASS 7.—Cocker spaniels.

Skip, A. Bassett, Pittsfield, Mass.; Prince, A. B. Morse, Indian Orchard; Lulu, D. L. Barker, Springfield; Cora, Samuel Scranton, Providence; Jack, W. Thornhill, Springfield, Fanny, do.; Grip, C. Alton, Worcester; Snip, S. J. Bestor, Hartford, Juliette, do.; Duck, M. J. Taft, Springfield; Curley, C. M. Gubb, Northampton, Mass.; Bat, Dr. J. M. Burland, Boston; litter of Cocker spaniels, Chas. Allen, Worcester.

CLASS 8.—Clumber spaniels.

Max, O. Edwards, Florence, Mass.; Ned, J. F. Jones, Springfield.

CLASS 9.—Retrieving spaniels.

Nell, T. M. Aldrich, Providence, R. I.; Ned, J. F. Jones, Springfield; Shot, J. H. Crosby, Jr., Enfield, Mass.

CLASS 10.—Irish water spaniels.

Floss, Geo. E. S. Law, Springfield; Dick, F. O. Hanson, Springfield; Billy Buttons, F. W. Jones, N. Y.; Dandy, W. D. Stevens, Springfield; Rover, R. W. Waterman, Athol, Mass., Jennie, do.

CLASS 11.—Fox hounds.

Judy, G. A. Edmonds, North Brookfield, Mass.; Jack, A. O. Terry, Longmeadow, Sailor, do.; Cuff, A. F. Schnitze, Springfield; two dogs; W. E. Gibbon, East Hartford, Conn.; Spot and Range, R. H. Gillispie, Stamford; Fan, Jerry Smith; Rover, W. L. Reyes, Springfield, Spot, do.; Flora, H. C. Jones, Steedsridge, Mass., Jeff and Slick, do.; Music, H. C. Norton, Springfield, Forest, do.; Hoop, C. H. White, South Hadley Falls, Mass.; Frannie, W. D. Blanchard, Leominster, Mass.; Rags, J. Kellogg, West Stockbridge, Mass; Bugler, G. M. Richards, North Dana, Mass.

CLASS 12.—Beagles. No entries.

CLASS 13.—Daschunds.

Daschund, Col. J. B. Clarke, Manchester, N. H.

CLASS 14.—Deerhounds.

Sir Walter, H. S. Bixby, Nashua, N. H.; Spider, do.

CLASS 15.—Greyhounds.

Fly, Mowry Bros., Wilbraham, Mass.

CLASS 16.—Newfoundlands.

Bruno, H. A. Phelan, West Springfield, Mass; Rover, M. B. Crane, Springfield; Rose, L. B. Merrin, Springfield.

CLASS 17.—St. Bernards.

Major, E. Rockwood, Springfield; Bruno, L. Crossett, Springfield; Honest, A. J. Marks, Chester, Mass.; Bouncer, A. D. Ashley, Springfield.

CLASS 18.—Mastiffs.

Sneun, W. S. Lincoln, Worcester, Mass.

CLASS 19.—Bull dogs. No entries.

CLASS 20.—Bull terriers.

Guess, G. W. Rice, Springfield; Jessie, J. J. Higgins, Springfield; Sport, Jno. Shea, Springfield, Mass.; Fan, J. Bruman, Springfield.

CLASS 21.—Collies or shepherd.

Loo, Jas. Bliss, Longmeadow, Mass.

CLASS 22.—Dalmatian or coach dogs.

Don Juan, L. A. Wright, Springfield; Jewel, L. Harris, Willimantic, Conn.; Sparkle, B. Harmon, Springfield; Prince, R. Flint, Munson, Mass.

CLASS 23.—Spitz.

Chub, C. W. Mitchell, Springfield.

CLASS 24.—Scotch terriers.

Zoe and four pups, Chas. L. Smith, West Springfield; Tip, P. S. Bailey, Springfield; Dixie, J. R. Darling, Springfield.

CLASS 25.—Skye terrier.

Bull, Gen James Watson Webb, Springfield; Chance, G. B. Bissell, Springfield, Mass.

CLASS 26.—Dandie-Dinmont terrier. No entries.

CLASS 27.—Rough haired terrier. No entries.

CLASS 28.—Pug terrier.

Bounce, S. Hammond, Boston; Pug, C. W. Bliss, Springfield.

CLASS 29.—Black-and tan terrier.

Skilly, W. Nobb, Springfield; Snip, S. K. Hindley, Worcester; Jinks, J. Edward Gray, Springfield.

CLASS 30.—Toy terrier.

Tinnie, T. S. Davis, Holyoke, Mass.

CLASS 31.—Blenheim spaniel. No entries.

CLASS 32.—St. Charles spaniel.

Charlie, S. K. Hindley, Worcester; Lady, do.; Sambo, Emerson Foote, New York.

CLASS 33.—Japanese spaniel.

Fuzzy, F. G. Gray, Springfield.

CLASS 34.—Italian greyhound.

Spottie, J. B. Shaw, Springfield; Agnes, G. B. Bissel, Springfield; Dot, J. R. Seaver, Malone, N. Y.

CLASS 35.—Poodle.

CLASS 36.—Japanese, or hairless.

Gyp, Wm. L. Warner, Springfield,

CHAMPION CLASSES.

CLASS 37.—Champion setter class.

Shamrock, Wm. Jarvis, Claremont, N. H.; Grouse, Jerome Marble, Worcester; Scoot, Luther Adams, Boston; Dan, B. F. Ricker, Brighton, Mass.; Jack, Jr., Lifleur, Huntington, Mass.; Dick, Wm. Jarvis, Claremont, N. H.; Don, L. B. Harding, Stamford; Blue-Blood, W. F. Parker, West Meriden; Norah, A. F. Copeland, Boston; Jersey Boy, J. Von Lengerke, Hoboken, N. J.; Snipe, J. A. Barnes, Hartford; Daisy, W. H. Balcom, Worcester; Trim, do.; Peg, do.; Lou, W. M. Tileston, N. Y.; Monarch, Horace Smith, N. Y.; Don, Adonis and Charm, Geo. Delano, Esq., New Bedford, Mass.

CLASS 38.—Champion setter class.

Dash, J. H. Steele, Ellington, Conn.; Nellie, do.; Sport, E. Allen, Florence, Mass.; Chum, Ethan Allen, Pomfret Centre, Conn.; Cash, do.; Jim, I Scranton, Providence, R. I.; Nigger, A. T. Currier, Whiting-

ville, Mass.; Jack, W. H. Burrell, Springfield; March, J. Dwight Francis, Pittsfield, Mass.; Ned, C. W. Giles, Springfield; Black Duke, Frank Warren, Springfield; Bess, W. H. Balcom, Worcester; Trim, do.; Dash, N. Saltus, Brooklyn; Mab, Emerson Foote, N. Y.

CLASS 39.—Champion pointer class.

Whisky, Dr. W. S. Webb, N. Y.; Juno, R. Eaves, Providence; Pete, G. A. Strong, West Meriden, Conn.; Dash, J. F. Harrison, Springfield; Guy, R. O. Morris, Springfield; Tip, N. H. Daniels, Huntington, Mass.; Stut, T. O. Downing, West Meriden, Conn.; Lex, H. S. Hyde, Springfield; Jeff, A. F. Craig, Hartford; Cal, C. W. Nixon, Springfield; Grouse, W. E. Sibbeu, East Hartford, Conn.; Rip, J. S. Murphy, Springfield; Guy, J. N. Dodge, Springfield; Don, E. C. Hawes, Springfield; Scout, E. H. Lathrop, Springfield; Daisy, Sanderson Williams, Springfield; Quaker, Wm. M. Williams, Springfield; Jake, H. C. Taft, Springfield; Lou, J. S. Fay, Southboro, Mass.; Mack, J. C. Woodward, South Hadley Falls, Mass.; Belle, Horace Smith, N. Y.

SPECIAL CLASSES.

CLASS 40.

Drake, Drake and Dora, Luther Adams, Boston; Peg, Trim, Bess and Daisy, W. H. Balcom, Worcester; Doll, Adonis and Charm, Geo. Delano, New Bedford.

CLASS 41.—For the best collection of pointers owned by one person.

Ned, F. Schuchardt, N. Y., Fan, do., Tom, do.; Don, Rap and Mack, J. W. Burton, New Britain, Conn.

CLASS 42.—For the best brace of setters owned by one person.

Trim and Flash, S. T. Hammond, Springfield; Scout and Rock, Luther Adams, Boston; Dash and Nellie, J. H. Steele, Ellington, Conn.; Dick and Shamrock, Wm. Jarvis, Claremont, N. H.; Cash and Charm, Ethan Allin, Pomfret Centre, Conn.; Don and Shot, E. Van Derwerker, Stamford; Nora and Shot, A. F. Copeland, Boston; Lill and Dash, N. Saltus, Brooklyn.

CLASS 43.—For the best brace of pointers owned by one person.

Shot and Ben, S. T. Hammond, Springfield; Pete and Mab, J. A. Strong, West Meriden, Conn.; Don, Theo. Morford, Newton, N. J.; May, do.

CLASS 44.—For the best setter dog pup.

Rock, J. Day, Springfield; Kent, Isaac Fiske, Worcester; Prince, Luther Adams, Boston; Joe, Dr. S. Fleet Speir, Brooklyn; Pup, W. H. Burrell, Springfield; Mack, J. N. Francis, Bridgeport; Duke, W. C. Harding, Stamford; Trump, C. M. Pond, Hartford; Smart, E. A. Herzberg, N. Y.; Rake, E. Orgill, N. Y., Ruby, do.; Rap, Dr. J. M. Borland, Boston.

CLASS 45.—For the best pointer dog pup.

Pat, Geo. DeF. Grant, N. Y.; Fritz, Gen. A. S. Webb, N. Y.; Shot, R. Eaves, Providence; Dick, do.; Spot, E. O. Soule, Springfield, Mass.; Ned, R. Richmond, New Britain, Conn.; Pete, E. C. Bingham, West Meriden, Conn.; Rock, do.; Rex, F. Hour, Jr., Brooklyn; Sport, J. F. Jones, Springfield; Jim, W. M. Williams, Springfield; Dick, H. G. Gilmore, Springfield; Dan, B. C. Brainerd, So. Headly Falls, Mass.; Phil, Jr., W. M. Theston, N. Y.; Lew, O. B. Cooley, Longmeadow, Mass.

CLASS 46.—For the best litter of setter pups.

Four pups, E. A. Herzborg, N. Y.; 2 pups, J. Nesbitt, Jr., Cambridge, Mass.; litter of puppies, C. H. Raymond, Morris Plains, N. J.; litter of six puppies, N. Saltus, Brooklyn.

CLASS 47.—For the best litter of pointer pups.

Five pups, Dr. W. S. Webb, N. Y.; 2 pups, R. Eaves, Providence; litter of pups, S. H. Davis, Durham, Conn.

CLASS 48.—For the best setter bitch pup.

Moline, Isaac Fiske, Worcester, Mass.; Zolpha, J. Nesbitt, Cambridge, Mass.; Fan, Dr. S. Fleet Speir; Norah, J. N. Francis, Bridgeport.

CLASS 49.—For the best pointer bitch pup.

Daisy, Dr. W. S. Webb, N. Y.; Psyche, C. W. Hixon, Springfield, Mass.; Queen Bess, Bassett Thompson, Foxboro, Mass.

CLASS 50.—For the largest dog.

Rover, M. B. Crane, Springfield; Horner, A. J. Marks, Chester, Mass.

CLASS 51.—For the smallest dog.

Tinnie, T. L. Davis, Holyoke, Mass.

CLASS 52.—For the best brick dog or bitch.

Guess, G. W. Rice, Springfield.

The class of English setters, judged by Mr. N. Saltus, was not a numerous one and was soon gotten through with. There could scarcely be a dissentiug voice as to the decision so far as the winner of 1st prize was concerned. Mr. Luther Adam's Scout, by his Rock out of imported Pickles, is a good dog, with a head that is simply perfect, and with much more size and substauce than could be expected from a little bitch of Pickles kind. But Rock appears to possess the faculty of transmittiug his own quality to his progeny. Mr. Delano's Charm, by Pride of the Border, out of Fairy, took second honors; but, although his breeding is so good, and notwithstauding his possessing the good traits of the Laveracks, he was so fat that we did not consider his chauches so good as those of his kennel companiou, Adonis. Mr. Parker's Blue Blood, by Rock, out of Dora, who has grown into a fine dog since we saw him last fall, was third.

We were glad to see Mr. Jarvis' Dick take the place of houor in the red Irish class, although it was almost a walk over, as Mr. Saltus' Dash, who would have pushed him very closely, was already a first prize winner. This gentleman took first for bitches with his imported Lill III, and his brace with their litter of handsome puppies attracted muct. attention. Snipe, placed second, was first last year in a much smaller collection.

In imported Gordons or their progeny, the "bar" clause shut out the finest specimens exhibited, notably the bitch Norah and old Shot (late Jeromes') the property of A. F. Copeland, Esq., of Boston, both being first prize winners. Mr. Jerome Marble's Grouse was deservedly placed first of those left in, although Dr. Strachan's Sport (second) was very close, and probably had he been marked with tan according to the recognized standard in this country, would have taken first honors. Sport is black with a little white, and is from Mr. James Gorden Bennett's stock. Monareh (third) a large, finely formed dog of the Belmont strain, was much out of condition, but being a youngster will show to advantage later. Lou, first in the bitch class, was imported as a puppy by Mr. Munn, and barring a somewhat short head, shows in coat and color the finest characteristics of the Gordon type. Mr. Emerson Foote was very close to the winner with Mab, half a point only separating them. Mr. Hammond's Flash, a St. Kilda bitch, was well placed as third.

The class of native setters was not only very large, there being over forty entries, but was very difficult to judge, Gordon's, red Irish, and native English, being thrown in together in a manner which must have been most confusing to a judge who was called upon to decide upon the merits not only of different dogs, but of rival strains. Mr. Jarvis, however, stood up to his work nobly and scarcely erred in placing Mr. Morford's Don and May, first in the dog and bitch entries respectively. We think that this award gave general satisfaction, and we congratulate Mr. Morford upon his success. No one has worked harder, more persistently, or more successfully, to bring to perfection a strain of native setters. A certain amount of chance enters into bench show exhibitions, and it is scarcely fair to criticise the action of a judge who is obliged to score his points on each dog according to his judgement, and it is not improbable that a very superior dog would show to the least advantage when under the hands of a judge, through timidity or fear. Among the native setters which appeared to us worthy of mention were, Lieut. Harry Metcalfe's red dog Jim, and Mr. J. Dwight Francis' March, of the old Ethau Allin strain. Mr. D. P. Charles, of Albany, also showed a very fine red dog named Fritz. Dinnity was worthy of the place she received next to May. Her pen, in which was a fine litter of puppies by Pride of the Border, was a great centre of attraction throughout the show.

The pointers were also very numerous, and Messrs. Orgill and Saltus, who judged respectively the large and small classes, had their hands full. Some confusion was created in judging the first named, from the fact of no distinction having been made between dogs and puppies, some of the latter being so well grown that when they were brought before the judge he was in doubt as to how he should judge them. Mr. Schuchardt's veteran, Tom, now eleven years old, was awarded first position by judge and spectators alike, but we confess that we should have preferred to have seen him followed by Mr. Brook's fine imported dog Bingo, or the fine lemon and white dog Cal, owned by Mr. Hixon, of Springfield. Mr. Stephenson, of West Meriden, showed a very fine young dog in Phil, a son of the champion Pete. Mr. Schuchardt was fortunate also with his bitch Fan, taking second for this sex; nor do we think that there was the twelve points difference between her and the winner, Nellie, as shown by the judges card. In the small pointer class, the entries were not so numerous, and we donbt if the judge could have done differently in placing Grouse first. Whisky was followed very closely by the "Squire's" Belle, only one point separating them, and one of Whisky's first litter, Rex, was named as the best dog puppy.

The spaniels were very much mixed up. Mr. Bestor deservedly took first for cockers, with his Snip, and his bitch Juliette was second in her class. Mr. Morford had anything but an easy task in judging the various classes entrusted to him, so mixed were the entries. In fact, it seems that while most sportsmen have been devoting their time and attention almost wholly to setters and pointers, the smaller breeds of sporting dogs have been neglected to such an extent that but few are well posted as to the characteristics of the various strains, and a general commiugling is the result. The cockers were many of them clearly marked after water spaniels, and it was difficult to decide which strain was most prominent. So of the Clumber, in which only the color was left together with size and characteristic of the setter. The water spaniels were better, and seemed to be very distinct. There was one entry, a dog, Ned, a Norfolk spaniel which bore evidence of being very pure blood, and was undoubtedly a fine specimen of this strain of Springer spaniels, for which there was no class. This dog is owned by Mr. J. F. Jones, of Springfield.

Our space will not permit us to review the various classes of toy, pet, or watch dogs; although mention must be made of the two magnificent Scotch stag hounds, Sir Walter and Spider, exhibited by Mr. H. G. Bixby, of Nashua, N. H. These dogs were each awarded 100 points, the maximum figure, denoting perfection. M. J. H. Seaver, of Maloue, N. Y., exhibited a fiue specimen of the Italian greyhound, which we considered superior to the one placed first by the judge.

In the champion classes, Scout was placed first, and it is difficult to find fault with the decision, although some complaint was made that the judge was disinclined to allow due meed of merit to Norah, on the grouud of her being a Gordon, but with Shamrock, Dick, Rock, and Mr. Delano's fine trio, Don, Adonis, and Charm, all to be passed upon, it was a difficult matter to decide. So also with the champion native setters. May being winner with 96 points to her credit, although pushed very closely by Mr. Saltus' Dash. Pete was victorious as the champion pointer, as was anticipated. Pete is a very hard dog to beat, although his head is faulty.

In the special classes many of the awards were based upon the points gained in the previous competitions. In the setter braces Mr. Adams was again successful with Scout and Rock, and also in the best collection class, with Duke, Drake, and Dora. Mr. Schuchardt won for the best collection of pointers, and Mr. Hammond in the braces.

The awards will be found in full below. Take it altogether, and in spite of the fact that three day's work was crowded into less than two, the Rod and Gun Bench Show was a complete sneeess, and there was less dissatisfaction expressed with the awards of the judges than we ever remember to have heard before. We desire to express our warmest thanks to the officers of the club and the various committees for courtesies shown, and facilities afforded during the show.

THE AWARDS.

CLASS 1.—Imported English setters, or their progeny, that have never taken first prize at any Beuch Show; Judge, N. Saltus, Esq., Brooklyn.

Best dog, silver cup; Scout, Luther Adams, Boston. Second best dog, gold dog whistle; Charm, Geo. Delano, New Bedford. Third best dog, diploma; Blue-blood, W. F. Parker, West Meriden, Conn. Best bitch, silver collar; Peg, W. H. Balcom, Worcester. Second best bitch, silver dog whistle; Jessie, E. A. Herzeberg, N. Y. Third best bitch, diploma; Doll, Geo. Delano, New Bedford. Best dog pup, diploma; France, Luther Adams, Boston.

CLASS 2.—Imported red or red and white Irish setters, or their progeny, that have never taken first prize at any Bench Show; Judge, W. H. Gibbons, Esq., Madison, N. J.

Best dog, silver cup; Dick, Wm. Jarvis, Claremont, N. H. Second best dog, gold dog whistle; Snipe, J. A. Barnes, Hartford, Conn. Third best dog, diploma; Jack, Max Wenzle, Hoboken, N. J. Best bitch, silver collar; Lill III, N. Saltus, Brooklyn. Second best bitch; no award. Third best bitch; no award. Best dog pup, diploma; Duke, W. C. Harding, Stamford, Conn.

CLASS 3.—Imported black and tan and black and tau and white Gordon setters, or their progeny, that have never taken first prize at any beech show; Judge, Luther Adams, Esq., Boston.

Best dog, silver cup; Grouse, Jerome Marble, Worcester. Second best dog, gold dog whistle; Sport, Dr. A. Russell Strachan, N. Y. Third best dog, diploma; Monarch, Horace Smith, N. Y. Best bitch, silver collar; Lou, W. M. Thesion, N. Y. Second best bitch, silver dog whistle; Mab, Emerson Foote, N. Y. Third best bitch, diploma; Flash, S. T. Hammond, Springfield. Best dog pup, diploma; Rake, E. Orgill, N. Y. Best bitch pup, diploma; Ruby, E. Orgill, N. Y.

CLASS 4.—Native setters of any strain that have never taken first prize at any Bench Show; Judge, Wm. Jarvis, Esq., Claremont, N. H.

Best dog, silver cup; Don, Theo. Morford, Newton, N. J. Second best dog, gold dog whistle; Ned, J. A. Larkin, Westfield, Mass. Third best dog, diploma; Jim, Samuel Scranton, Providence, R. I. Best bitch, silver collar; May, Theo. Morford, Newton, N. J. Second best bitch, silver dog whistle; Dinnity, C. H. Raymond, Morris Plains, N. J. Third best bitch, diploma; Maud, John Nesbitt, Cambridge, Mass. Best dog pup, diploma; Rab, Dr. J. M. Borland, Boston. Best bitch pup, diploma; Bess, W. H. Balcom, Worcester.

CLASS 5.—Pointers of 50 lbs. weight and over that have never taken first prize at any Bench Show; Judge, E. Orgill, Esq., N. Y.

Best dog, silver cup; Tom, F. Schuchardt, N. Y. Second best dog, gold dog whistle; Jack, H. C. Taft, Springfield. Third best dog, diploma; Mack, Jas. Warburton, New Britain, Conn. Best bitch, silver collar; Nellie, O. B. Cooley, Longmeadow, Mass. Second best bitch, silver dog whistle; Fan, F. Schuchardt, N. Y. Third best bitch; no award. Best dog pup, diploma; Ned, F. Schuchardt, N. Y. Best bitch pup, diploma; Pilot, Lewis Miller, Springfield.

CLASS 6.—Pointers under 50 lbs. weight that have never taken first prize at any Bench Show; Judge, N. Saltus, Esq., Brooklyn.

Best dog, silver cup; Grouse, W. E. Gibbons, West Hartland, Conn. Second best dog, gold dog whistle; Guy, J. N. Dodge, Springfield. Third best dog, diploma; Lex, H. S. Hyde, Springfield. Best bitch, silver collar; Whisky, Dr. W. S. Webb, N. Y. Second best bitch, silver dog whistle; Belle, Horace Smith, N. Y. Third best bitch, diploma; Daisy, Sanderson and Williams, Springfield. Best dog pup, diploma; Rex, F. Howe, Jr., Brooklyn, N. Y. Best bitch pup, diploma; Psyche, C. W. Hixon, Springfield.

CLASS 7.—Cocker spaniels; Judge, Theo. Morford, Esq., Newton, N. J.

Best dog, Smith & Wesson No. 3 revolver, value $20.00; donated by D. B. Wesson, Springfield, Mass.; Snip, S. J. Bestor, Hartford. Second best dog, gold dog whistle; Guy, J. N. Dodge, Springfield. Third best dog, diploma; Lex, H. S. Hyde, Springfield. Best bitch, silver collar; Whisky, Dr. W. S. Webb, N. Y. Second best bitch, silver dog whistle; Belle, Horace Smith, N. Y. Third best bitch, diploma; Daisy, Sanderson and Williams, Springfield. Best dog pup, diploma; Rex, F. Howe, Jr., Brooklyn, N. Y. Best bitch pup, diploma; Psyche, C. W. Hixon, Springfield.

CLASS 8.—Clumber spaniels; Judge, Theo. Morford, Esq.

For the best dog, split bamboo fly-rod, value $25.00; donated by L. H. Mayott, dealer in sportsmen's good 415 Main street, Springfield, Mass.; Max, Samuel O. Edwards, Florence, Mass.; no other awards in this class.

CLASS 9.—Retrieving spaniels; Judge, Theo. Morford, Esq.

Best dog, American single-barrel breech-loading shot gun, value $25.00; donated by Hyde & Shattuck, manufacturers of sporting guns, 293 Main street, Springfield, Mass; Shot, J. M. Crosby, Jr., Enfield, Mass. Second best dog, camp lounge, value $6.00; donated by C. S. Camp Lounge Company, Troy, N. Y.; Flush, W. B. Morse, Jr., and O. Orgood, Mass.; T. M. Aldrich was awarded diploma for the best dog and bitch puppies.

CLASS 10.—Irish water spaniels; Judge, Theo. Morford, Esq.

Best dog, hunter's pet rifle, value $20.00; donated by a sportsman; Dandy, W. B. Stevens, Springfield, Mass. Second best dog, keg Orange Ducking Powder; Rover, R. H. Waterman, Athol, Mass. Best bitch, special prize, value $20.00; Rose, W. S. Johnson, North Adams, Mass. Second best bitch, Floss, G. E. Law, Springfield, keg Orange Ducking Powder.

CLASS 11.—Fox hounds; Judge, E. S. Knowles, Esq., Worcester.

Best dog or bitch, double-barrelled breech-loading shot gun, value $50.00; donated by J. Stevens & Co., manufacturers of sporting guns and rifles, Chicopee Falls, Mass.; Fan, Jerry Quirk, Worcester. Second best dog or bitch, 100 metallic shells, with loader and capper, value $25.00; donated by Geo. S. Hart & Co., Newark, N. J.; Sport, W. L. Keyes, Springfield. Third best dog or bitch, keg of Orange Ducking Powder; donated by Laflin & Rand Powder Co., No. 21 Park Row, N. Y.; Whoop, C. H. White, South Hadley. Best dog or bitch pup, Smith & Wesson revolver, Judy, Geo. A. Edmunds, North Brookfield, Mass. Second best dog or bitch pup, camp lounge, value $6.00; donated by U. S. Camp Lounge Co., Troy, N. Y.; Slick, H. C. Jones, Stockbridge, Mass.

CLASS 12.—No entries.

CLASS 13.—Dachsbunds; Judge, E. S. Kuowles, Esq.

Best dog or bitch, silver medal, Dachshund, Col. Clark, Manchester, N. H.

CLASS 14.—Deerhounds; Judge, E. S. Knowles.

Best dog or bitch silver medal, Sir Walter, H. J. Bixby, Nashua, N. H. Second best dog or bitch, diploma, Spider, H. J. Bixby, Nashua, N. H.

CLASS 15.—Greyhounds; Judge, Ethan Allin, Esq., Pomfret Centre.

Best dog or bitch, silver medal, Fly, Mowry Bros., Wilbraham, Mass.

CLASS 16.—Newfoundlands; Judge, Ethan Allin, Esq.

Best dog or bitch, silver medal, Bruno, H. A. Phelan, West Springfield. Second best dog or bitch, diploma, Rose, Mrs. L. B. Merrill, W. Springfield. Best dog or bitch pup, diploma, Mrs. L. B. Merrill, West sprngfield.

CLASS 17.—St. Bernards; Judge, Ethan Allin, Esq.

Best dog or bitch, silver medal, Major, E. Rockwood, Springfield. Second best dog or bitch, diploma, Honest, A. J. Marks, Chester.

CLASSES 18 and 19.—No entries.

CLASS 20.—Bull terriers; Judge, Geo. De F. Grant, Esq., N. Y.

Best dog or bitch, silver medal, Jessie, J. J. Higgins, Springfield. Second best dog or bitch, diploma, Fan, John Braman, Springfield.

CLASS 21.—Collies or shepherd; Judge, Ethan Allin, Esq.

Best dog or bitch, silver medal, Leo, J. J. Bliss, Longmeadow, Mass.

CLASS 22.—Dalmatian or coach dogs; Judge, Geo. De F. Grant, Esq.

Best dog or bitch, silver medal, Jewell, J. Harris, Williamantic, Conn. Second best dog or bitch, diploma, Sparkle, B. Beattie, Springfield.

CLASS 23.—Spitz; Judge, Ethan Allin, Esq.

Best dog or bitch, silver medal, Chub, C. W. Nutchell, Springfield.

CLASS 24.—Scotch terriers; Judge, C. H. Raymond, Esq., Morris Plains, N. J.

Best dog or bitch, silver collar, Dixie, J. H. Damon, Springfield. For the best dog or bitch pup, diploma, C. L. Smith, West Springfield.

CLASS 25.—Skye terrier; Judge, C. H. Raymond, Esq.

Best dog or bitch, silver collar, Chance, G. B. Bissell, Springfield. Second best dog or bitch, diploma, Bull, Gen. J. Watson Webb, N. Y.

CLASSES 26 and 27.—No entries.

CLASS 28.—Pug terriers; Judge, C. H. Raymond, Esq.

Best dog or bitch, silver collar, Peg, C. W. Bass, Springfield. Second best dog or bitch, diploma, Bounce, S. Hammond, Boston.

CLASS 29.—Black and tan terrier; Judge, C. H. Raymond, Esq.

Best dog or bitch, silver collar, Jinks, S. E. Gray, Springfield. Second best dog or bitch, Skilly, W. Noble, Springfield. For the best dog or bitch pup, diploma, Snip, S. H. Brady, Worcester.

CLASS 30.—Toy terrier; Judge, C. H. Raymond, Esq.

Best dog or bitch, silver collar, Tinnie, T. L. Davis, Holyoke.

CLASS 31.—Blenheim spaniel; Judge, C. H. Raymond, Esq.
No entries.
CLASS 32.—St. Charles spaniel; Judge, C. H. Raymond.
Best dog or bitch, silver collar, Sambo, Emerson Foote, N. Y. Second best dog or bitch, diploma, Lady, S. K. Hindly, Worcester, R. C. Charley, do.
CLASS 33.—Japanese spaniel; Judge, C. H. Raymond, Esq.
Best dog or bitch, silver collar, Fuzzy, T. E. Gray, Springfield.
CLASS 34.—Italian greyhound; Judge, C. H. Raymond, Esq.
Best dog or bitch, silver collar, Spottie. J. B. Shaw, Springfield. Second best dog or bitch, diploma, Dot, J. K. Seaver, Malone, N. Y. Best dog or bitch pup, G. B. Bissen, Springfield.
CLASS 35.—No entries.
CLASS 36.—Japanese or hairless; Judge, C. H. Raymond, Esq.
Best dog or bitch, silver collar, Gyp, W. L. Warner, Springfield.

CHAMPION CLASSES.

CLASS 37.—Champion setter class; Judge, E. Orvill, Esq.
Best imported setter dog or bitch of any strain, or their progeny, that has taken first prize at any Bench Show, including this, silver cup, value, $100, donated by *Spirit of the Times*, No. 4 Park Row, N. Y., the winner's picture to be published in that paper; Scout, Luther Adams, Boston.
CLASS 38.—Champion setter class; Judge, E. Orvill, Esq.
Best native setter dog or bitch of any strain that has taken first prize at any Bench Show, including this; silver cup, donated by Chicago *Field*, May, Tiico, Morford, Newton, N. J.
CLASS 39.—Champion pointer class; Judge, N. Saltus, Esq.
Best pointer dog or bitch that has taken first prize at any Bench Show, including this, double barrelled breech-loading shot gun, value $150; donated by Parker Brothers, manufacturer of fine guns, West Meriden, Conn. Pete, G. A. Strong, West Meriden, Conn.

SPECIAL CLASSES.

CLASS 40.—Best collection of setters (not less than three) owned by one person, the average number of points to decide the award: Rifle, value $60 00; donated by Frank We-son, manufacturer of breech loading ing rifles, Worcester, Mass; Duke, Drake and Dora, Luther Adams, Boston.
CLASS 41.—Best collection of pointers (not less than three) owned by one person, the average number of points to decide the award; Green heart fly rod, $50.00; donated by J. B. Crook & Co., dealers in fishing tackle, No. 50 Fulton street, New York; Tom, Ned, and Fan, F. Schuchardt, N. Y.
CLASS 42.—Best brace of setters owned by one person, winners in Class No. 40 not to compete; Meerschaum pipe, value $150.00; donated by Editor and Publisher of FOREST AND STREAM, No. 17 Chatham street, New York. Rock and Scout, Luther Adams, Boston. Judge, Dr. M. Goldsmith.
CLASS 43.—Best brace of pointers owned by one person, winners in Class 41 not to compete; Meerschaum pipe, value $150.00, manufactured by Kaldenburg; donated by *Rod and Gun* new-paper, No. 33 Park Row, New York. Shot and Ben, S. T. Hammond, Springfield, Mass. Judge, W. H. Gibbons, Esq.
CLASS 44.—Best setter dog pup, one water-proof canvas shooting suit, valued $25.00; made to fit the owner; donated by Thompson & Son, 338 Broadway, New York, dealers in sportsmen's goods. Prince, Luther Adams, Boston.
CLASS 45.—Best pointer dog pup, one of Holabird's shooting suits, made to fit the owner, value $20.00; donated by Dr. W. S. Webb, St. Luke's Hospital, New York. Ned, F. Schuchardt, New York.
CLASS 46.—Best litter of setter pups, silver cup value $25.00; donated by Luther Adams, No. 115 Broad street, Boston, Mass. John Nesbitt, Jr., Cambridge, Mass. Judge, N. Saltus, Esq.
CLASS 47.—Best litter of pointer pups, 500 paper shells, 100 metallic shells, value $25.00; donated by Union Metallic Cartridge Co., Bridgeport, Conn. Dr. W. S. Webb, New York. Judge, E. Orgill, Esq.
CLASS 48.—Best setter bitch pup, a dog puppy by "Pride of the Border," out of "Dimity"; donated by Charles H. Raymond, 141 Broadway, New York. Ruby E. Orgill, N. Y. Judge, A. F. Copeland, Esq.
CLASS 49.—Best pointer bitch pup, Smith & Wesson revolver, No. 38, value $15.00; donated by D B. Wesson, Springfield, Mass. Psyche, C. W. Hixon, Springfield.
CLASS 50.—For the largest dog, gold lined cap, value $10.00. Rover, weight 181 pounds, M. B. Crane, Springfield.
CLASS 51.—For the smallest dog gold lined cap, value $8 00. Tinnie, weigh four pounds, T. S. Davis, Holyoke.
CLASS 52.—For the best trick dog or bitch, gold medal. Guess, G. W. Rice, Springfield.

A special premium was awarded to Mr. W. L. Brooks, of Stamford, for his magnificent imported pointer dog Bingo.

HOW THE NEW YORK DELEGATION STARTED.—Our evergreen friend Col. Skinner, of *Turf, Field and Farm*, is inimitable—we had almost called him unique—in his descriptions. Witness the following graphic account of the scene which attended the departure from this office of the delegation to Springfield last week:—

"NEW YORK AT THE SPRINGFIELD BENCH SHOW.—On Tuesday we witnessed the departure of the New York contingent of sportsmen for the great exhibition at Springfield. Quite a detachment left the office of the FOREST AND STREAM, under the leadership of the ancient Squire and Mr. Tileston, and they created a great sensation, mounted on one of French's best coaches, the interior of which was filled with a barking, howling pack of setters and pointers, all of the bluest blood and each bound to carry off the highest prize. A stout, red nosed Teuton, with inexhaustible lungs, enlivened the march with airs upon the keyed bugle, to which the howlings of the imprisoned dogs furnished a powerful if not a strictly musical chorus. The patriarchal Squire Smith sat enthroned, as it were, upon the 'imperial' of the coach, like a Roman conqueror on a triumphal car. Clear and sharp above the tempest of sound produced by the Dutchman's bugle and the howling of the dogs, could be heard his imperious mandates to his canine pupils to 'Shut up!' 'Down charge!' 'Take heed!' but it must be confessed that, demoralized by the motion of the coach, the best trained pointers and setters howled and barked and fought, and did other unmentionable things, in defiance of the Squire and their owners, who joined their efforts to his in the attempt to keep the peace. The passage of a coach so laden through Broadway gave rise to much speculation. Those who heard the noise without seeing the dogs fancied the coach was laden with dangerous lunatics being conveyed to some asylum; others that it was a sort of pandemonium on wheels; and one benevolent old gentleman suggested that the coach was filled with sick dogs sent out for an airing under the auspices of the great humanitarian, Mr. Bergh. Among the setters and pointers we recognized Mr. Tileo. Morford's beautiful orange and white pair, May and Don, both by his famous Joe, and Don out of a Gildersleeve bitch, and Squire Smith had a fine black and tan Gordon of Belmont stock. Von Lengerke had a handsome black, white and tan, imported by the revered Mr. Berg, and Tileston entered a beautiful black and tan bitch from Mr. Munn's kennel, derived originally from the Duke of Devonshire's stock. We noticed also two beautiful black pointers of the very highest quality, one of them by Waddell's Phil. We doubt whether the men or the dogs which were driven away from the FOREST AND STREAM office on Tuesday last will be matched at Springfield."

That the Colonel was very nearly right may be gathered from the fact that six out of the eight dogs in the coach were prize winners, including four "firsts."

—The imported red Irish setter Juno, belonging to Mr. Thos. Adcock, of Providence, whelped 14 pups on the 30th inst., the sexes being equally divided, sired by Plunkett, and all resembling him in being all red with the exception of a small star in the forehead.

CLUMBERS WITH A PEDIGREE.—Our Montreal correspondent, Standard, writes:—"I was in Kentville, N. S., a few days ago and saw those clumber spaniels of B. S., spoken of in your issue of April 6th. They are good bred dogs, with a pedigree as long as ——, well I have seen some long pedigrees before, but they all pale before those of Ben Smith's dogs. Whew! but they are lengthy—clean back beyond old Queen Elizabeth's time."

—It is not true, as reported, that a well-known young gentleman of New York "judged" the coach dogs by counting the spots on each.

—There was "bark" enough in Springfield last week to start a first-class tan-yard.

The Rifle.

CONLIN'S GALLERY.—The rifle tournament which has been open for some six weeks past at this gallery, to raise a sum sufficient to meet the expenses of a summer exension of the St. John's Guild has proved a complete success. Five hundred tickets have been sold at $1 each, and of these sold 481 were shot off at the gallery. The shooting was done at the 110 foot range wit a 22-calibre Ballard rifle off hand, ten shots per target at ready measurement targets, by which the distance of each shot from the centre of the bull's-eye could be determined with the greatest accuracy. The shooting, as a whole, showed the finest aggregate of close shooting which gallery records can show. The following are a few of the leading targets, the figures giving the aggregate divergence of the ten shots from the bull's eye centre in inches and fractions:

Name.	Inches.	Name.	Inches.
L. V. Sone	4 6 8	F. Bullock	8 6 8
Chas. A. Cheever	4 15 16	D. L. Beckwith	9
Wm. Hayes	5 1-16	L. C. Bruce	9 3 16
C. E. Blydenburg	5 7-16	C. G. Peters	9 5-16
W. B. Farwell	5¼	Thomas Fenton	10
J. B. Blydenburg	6 11-16	E. J. Earle	10½
W. P. Sherwood	6½	T. C. Fleming	10 3-16
Fred Kessler	7 3-8	Wm. Connerly	11 11-16
J. T. B. Collins	7¼	G. W. Yale	11 6-8
Geo. T. Morton	7⅛	A. W. MacCreary	11 15 16
T. C. Noone	7 13-16	F. H. Holton	12
N. P. Lemon	7 13-16	W. L. Candee	12
Homer Lee	7 7⅛	E. Richardson	12⅜
H. D. Blydenburg	8	W. D. Steers	12 3-16
C. E. De Forest	8 7-16	J. H. Cowperthwait	13½
A. J. Bonar	8 6 9	P. Schilling	13½

CREEDMOOR.—The Luther Badge will be shot for on Saturday the 6th; shooting commencing at 2 P. M. The *Spirit of the Times* match will be shot at 3.15.

GLENDRAKE.—The American Rifle Association will hold their spring meeting on the 16th, 17th, 18th and 19th inst. The programme will be priuted next week.

MORSEMERE.—The first annual spring meeting of the Yonkers Rifle Association was held on Friday and Saturday of last week. Eight targets and butts were in operation, with Col. Ellis as officer of the day. All the matches were open to all comers, under the directions of the Range Committee and the rules and regulations of the Yonkers Rifle Association were strictly enforced. No practice was permitted. The shooting began at eleven o'clock A. M., the first match being that of the "man target," for which there were twenty-six entries; the second was the short range match with sixty entries, the Carlon match, four targets and sixteen entries. The event of the day was the team match. The targets used in the team match were the Carton, eleven-inch bull's-eye, inside the usual Creedmoor twenty-two inch bull's-eye, and shots upon the former counted six against five upon those on the Creedmoor, or largest bull's-eye. The following is the score in the match:—

YONKERS SENIOR TEAM.

	Carton.	Creedmoor.
Charles Dusenbury, Jr., 5 5 4 5 5 6 5 5 6 6 6 5 6 5 5 5 5 4 6 5	104	98
A. H. Jocelyn, 5 5 6 6 5 4 4 5 5 6 3 6 4 6 5 5 5 3 6	102	97
L. M. Ballard, 4 6 6 4 5 5 4 6 6 5 5 5 5 5 5 6 5 6 5 4 5	101	96
Captain D Smyth, 5 4 6 3 6 5 5 5 4 5 6 5 5 5 4 4 6 5 6	99	94
Major F. Shonnard, 6 5 6 6 5 5 0 5 5 5 6 6 4 5 3 5 4 5 3	94	89
Grand totals	500	474

AMATEUR RIFLE CLUB.

G. W. Yale, 5 5 5 4 4 5 4 5 5 5 4 4 5 5 5 6 5	96	95
W. B. Farwell, 5 4 6 4 6 4 5 6 6 5 5 6 6 5 6	106	97
H. S. Jewell, 4 4 5 6 4 5 4 6 6 3 5 5 5 5 6 5 5 4 5 4	98	94
J. S. Conlin, 4 6 3 4 4 6 5 3 4 4 6 5 6 5 5 5 6	98	92
L. C. Bruce, 4 4 5 5 6 6 6 5 6 6 6 6 4 5 5 4 5 5 8	101	93
Grand totals	499	470

YONKERS JUNIOR TEAM.

G. L. Morse, 5 3 4 5 4 4 5 4 0 5 6 5 4 3 3 5 6 4	81	80
H. L. Garrison, 5 4 6 5 5 3 5 5 5 6 6 6 5 6 5 4 5	100	95
A. D. Hodgeman, 4 3 5 4 6 6 4 4 5 5 6 6 6 4 4 5 6 6	97	90
H. J. Quinn, 5 6 6 4 4 4 4 6 4 3 5 5 5 4 5 5 4 6	94	90
S. G. Perry, 3 5 4 5 6 5 6 6 4 6 5 6 5 5 4 4 6 6 7	101	94
Grand totals	473	449

In the "man target" match Messrs. J. E. Stetson and T. W. Hoefle tied on 21 out of a possible 25, and Mr. Stetson not appearing to shoot off the tie, Mr. Hoefle was awarded the first prize, a fine hunting knife. In a similar match, on the second day, Mr. H. J. Quinn made 20 points, and Mr. G. L. Morse, 18 points. At the short range match at 200 yards, any rifle, and without time limit, ten shots per man, the leading scores were J. E. Stetson, 44 in the possible 50, and Major F. Shonnard, 43. The prize was a plated revolver. Mr. Homer Fisher won the 500 yards Carton match, making two centres in five shots. Saturday was devoted to the mid-range and individual matches. In the former a telescope was offered as a trophy, and was taken by C. Dusenbury, Jr., with a score of 34 in a possible 35. His score was duplicated by Captain Douglass Smyth, but in firing off the tie Dusenbury put in another bull's-eye, while Smyth fell to a centre. Among the leading scores in the match were:—

Name.	Total.	Name.	Total.
C. Dusenbury, Jr	34	H. Fisher	30
Douglass Smyth	34	F. Shonnard	29
A. D. Hodgeman	31	G. L. Morse	26
R. Rathbone	31	E. C. Gould	18

The individual match differed from the preceding in having the Morsemere count and the Carton bull's eye. Here Mr. Dusenbury again held his own, throwing ten consecutive shots within the compass of a 20 inch circle, and of those four were within the 11-inch central spot. According to the usual style of counting the several gentlemen, whose scores are given below, made in the possible fifty: C. Dusenbury, 50; Fisher, 49; Smyth, 47; Jocelyn, 47; Hodgeman, 46; Shonnard, 44; Morse, 42, and Gould, 40. According to the counting scheme adopted the full scores were:—

Name.	Score.	Total.
C. Dusenbury, Jr	6 5 6 5 5 5 5 5 6 6	51
H. Fisher	5 6 5 6 5 5 4 6 6 5	53
D. Smyth	3 4 6 6 5 6 5 5 4	51
R. Rathbone	5 4 5 5 5 4 4 6 5 6	49
A. H. Jocelyn	4 4 5 5 5 4 6 5 5 5	48
A. D. Hodgeman	5 4 5 4 4 4 5 5 5 5	46
F. Shonnard	5 6 5 3 5 6 3 3 5 5	46
G. L. Morse	4 5 6 6 3 5 4 4 3 4	44
E. C. Gould	4 4 3 4 5 5 3 3 5 4	40

—A correspondent writes from Minnesota:—"One of your Wyoming correspondents (and by the way where do you not have readers and correspondents)? complains that his Winchester rifle misses fire, and asks why. The trouble may be in the cartridges, if rim fire more particularly, but if his rifle is of the old model, it is more than likely that the plunger or striking pin has got foul and caked with dirt and oil. A rifle of this make, owned by a friend, acted in this way last fall. He took it to a gun smith who cleaned it thoroughly, and it has not missed fire since."

VERMONT.—The Manchester Amateur Rifle Club had their annual meeting last week. The usual Creedmoor 200 yards target was used. The following are the scores:—

First score 10 yards off-hand.

Name.	Score.	T'l.	Name.	Score	T'l.
J. F. Brown	3 3 4 3 3	16	Oliver Greeley	0 2 3 3 2	10
C. L. Harmon	3 2 4 3 2	14	J. H. Hucknns	3 3 2 0 0	8
D. W. C. Parker	0 3 2 3 4	12	C. C. Clark	0 3 0 0 3	6

Second score 100 yards off-hand.

Name.	Score.	T'l.	Name.	Score.	T'l.
J. F. Brown	4 3 4 2 1	17	Oliver Greeley	2 4 0 2 3	11
C. L. Harmon	4 2 2 4 3	15	J. H. Hucknns	0 4 0 2 2	8
D. W. C. Parker	4 3 2 2 4	15	C. C. Clark	0 0 2 2 3	7

Third score, 100 yards kneeling.

Name.	Score.	T'l.	Name.	Score.	T'l.
J. F. Brown	4 3 3 3 4	17	J. H. Hucknns	2 3 2 2 2	12
D. W. C. Parker	2 2 4 4 3	15	C. L. Harmon	0 2 3 2 4	11
C. C. Clark	3 4 3 3 3	16	Oliver Greeley	3 3 0 3 0	9

Fourth score, 200 yards, lying and without artificial rests.

CALIFORNIA.—Long range shooting is all the fashion now in California, and the rifleuen are competing for places in the International Team. The second of these matches was shot recently at the Bay View range, in which Capt. Burns was the only competitor who succeeded in scoring the necessary percentage at the aggregate of all distances. The following is his score:—

800 yards	4 2 3 4 5 4 5 5 4 2 4 4 5 5 4 — 61
900 yards	4 4 5 4 4 5 5 0 5 3 4 3 4 5 4 — 58
1000 yards	3 3 4 5 2 5 4 5 3 3 5 5 4 3 2 4 3 5 5 3 — 78
Total points	302
Highest score possible, 250. Credit, 80 4-5 per cent.	

The members of the Sumner Light Guard are practising as teams with very excellent results.

CHICAGO.—The members of the Chicago Rifle Club met last week to shoot for a revolver, presented by George Buttenmuller, at the South Park range; distance, 250 yards, off-hand. An equal number of all present took part on each side, the team making the highest aggregate score to shoot three additional shots each, the one making the best score to take the revolver. The shooting was of the most exciting character, Mr. Burnham's team winning by only one point. In shooting off Mr. S. W. Burnham made the best score, thereby winning a very beautiful prize. Next Saturday there will be two prizes, and it is expected the members will be present without further notice. Below is the complete score:—

Name.	Total.	Name.	Total.
S. W. Burnham	35	J. A. Shaffer	30
Walter Burnham	35	S. E. Bliss	25
W. R. Allen	34	H. G. Howe	25
D. B. Fisk	34	O. C. Blackmer	21
Geo. Beattenmuller	31	J. W. Roberts	18
B. L. Nourse	29	H. W. S. Cleveland	25
Grand total	195	Grand total	191

The scores made in shooting off, three shots each, were as follows:—S. W. Burnham, 12; W. R. Allen, 10; Geo. Beattenmuller, 10; D. B. Fisk, 15; B. F. Nourse, 10; Walter Burnam, 3.

LOUISIANA.—The members of the New Orleans Rifle Club were out in force on the 23d, and firing was very brisk throughout the day. There were also a great many strangers present, not so much to see the shooting as to hear the music from the German military band, which is on its way to the Centennial. The following are the leading scores:—

Centennial target, 25 half-inch rings, off hand.

Name.	Total.	Name.	Total.
C. Kiessner	163	M. Whitelor	150
L. A. Jung	165	E. J. Wenck	140
A. Wattenhofer	163		

Wimbledon target, possible 50, off-hand.

Name.	Total.	Name.	Total.
C. Kiessner	44	M. Wmeler	42
L. A. Jung	44	E. J. Wenck	41
A. Wattenhofer	43		

This Club will soon be able to commence their new house, as one of its members has kindly offered to take up all the stock not yet subscribed (2,000), if the club would make it privileged stock, this proposition being brought before a meeting of the stockholders, the offer was accepted. In the pigeon match last week between M. J. H. Acklen and M. Le Breton, the former was victorious. GUSSIE.

MILWAUKEE, April 29th, 1876.

EDITOR FOREST AND STREAM:—

The second competition at 500 yards for the Brodhead field glass prize came off on the 21st. Bangs made the best score, 71 out of 75; wins the glass once, and feels happy. Several others expect to feel happy next time. The following are the scores:—

Name.	Total.	Name.	Total.
Bangs	71	Sketch	66
Turner	70	Hawley	58
Fielding	69	Johnston	52
Yale	69	Booth	49
Mennier	66	Arnold	49

The third competition, at 200 yards, for the Brodhead field-glass came off yesterday. The wind blowing a gale from the northwest made it a very difficult task to hold on the bull's-eye. Mennier and Turner tied on the result, but as the score was to be decided according to Wingate, Mennier wins. The score now stands Arnold, 1; Mennier, 2. John evidently means to get that "looking-glass." The following are the scores:—

Name.	Total.	Name.	Total.
John Mennier	36	J. M. Arnold	36
Chas. Turner	35	J. C. Wells	35
E. Fielding	38	C. Simonds	29
H. T. Drake	37		

The club has had a new set of movable targets put up, and we now think our range is the best in America. I shall be able to send you an account of our first attempt at 1,000 yards very soon. WAU WAU.

Game Bag and Gun.

MAY IS A CLOSE MONTH FOR GAME.

GAME IN MARKET.—English snipe are not so abundant as they were last week, and prices have advanced to $2.50 per dozen, western birds principally. We noticed, also, some yellow legs from the west, selling at the same price. Wild pigeons are very abundant, selling for $1 per dozen.

—The Biddeford (Me.) *Chronicle* says that a party of Saco gentlemen, including a clergyman, a postmaster, a prominent grocer, and an ex-member of the city government, went gunning for coots last week. One of the party got a good chance, and brought down the minister and the postmaster at one shot! The man who fired the gun was not hurt.

—Ducks were very plentiful on the upper Susquehanna at the beginning of the present week, all hastening northward, though there need be little haste, for there is ten feet depth of snow in Lower Canada.

—The Massachusetts State Sportsmens Association met at Springfield on the 26th ult., and elected the following officers:—President, George Delano, New Bedford; Recording Secretary, Warren Hopegood, Boston; Corresponding Secretary, Dana K. Fitch, Worcester; Treasurer, Luther Adams, Boston. The following gentlemen were elected as delegates to represent the Association at the National Sportsmen's Association:—Luther Adams, Boston; A. F. Copeland, Boston; C. D. Lewis, Framingham; Jerome Marble, Worcester, and S. T. Hammond, Springfield.

The meeting adjourned to meet at the Bay State House, Worcester, on the 7th of December.

MASSACHUSETTS—*Boston, May 1st.*—Snipe are now really upon us. The close of the present week will allow us to foot up our score on snipe shooting for this spring. As far as we know, the results will show about an average with previous years. The birds have been generally found on rather high ground, on account of meadows being wet. M.

OHIO—*Hudson, Summit Co., April 30th.*—A few snipe here yet. Carolina rail and Virginia rail are here. Pigeons have been here two months, but the great day was about April 16th. F.

MINNESOTA—*Brainerd, April 30th.*—A few ducks have made their appearance wherever they can find open water, which is as yet only along the streams, brooks, and edges of lakes, while from the West we hear they have arrived as usual in immense numbers. At Chrystal Springs, a station on the Dacotah division of the N. P. R. R., is a splendid place for all kinds of water fowl—ducks, geese, swan, etc. The lakes and sloughs there are all shallow, with hard bottoms. One hardly needs a boat, but can walk through the rice and rushes and shoot till shooting ceases to be a pleasure. Grouse have wintered well, and if the early summer is not too wet bid fair to be more numerous than last season. Anywhere west of here forty miles one can always find pintails, and if one wants to "go west" as far as the Missouri River he can be sure to have sport, and plenty of it. The very mild winter has been remarkably favorable for deer. As we had no deep snow, with crust, the Indians and hide hunters did not have a chance to butcher them. HAVILAND.

NEW BRUNSWICK, Canada—*St. John, April 24th.*—There are a few brant being picked up along the north shore, near Shediac, but nothing to make note of. STANSTEAD.

PIGEON MATCHES.

—Capt. Bogardus writes us from Elkhart, Ill., under date of 24th inst., that he has made a match with W. G. Price, the noted English pigeon shot, to shoot for the Champion Medal won by the Captain in England last summer. The conditions of the match are to shoot at 100 pigeons each; 50 from three traps, 30 yards rise, English rules, 15 pairs at 18 yards rise and 20 single birds at 21 yards rise, under the rules of the Prairie Club of Chicago. The match is to be shot to-morrow, 5th inst., at Indianopolis, Indiana, and the birds shot at are to be wild pigeons.

LONG ISLAND SHOOTING CLUB.—The monthly competition for the challenge cup of this association took place on Saturday last, on their grounds near Jamaica. Twenty members took part in the contest, and the prize ultimately fell to Mr. Levi Radin, who has before had it in his possession. The conditions under which the cup is shot for are:—Seven birds each, 25 yards rise, 80 yards boundary, 1¼ oz. shot, and club rules to govern, with the exception that the last winner is penalized two yards. Dr. Wynn being that gentleman, he stood at 27 yards. The birds as a lot were quite good, many of them being fast and with strength sufficient to reach the boundary line after being hit very hard. The contestants failing to knock over their pigeons almost invariably shot behind them, and so often was the gun at fault in this particular it provoked considerable criticism. Neither of the shooters made a clean score, and but two killed six each, these being Mr. Radin and Mr. H. L. Van Wyck. In shooting off the tie both men were very nervous and did poorly. The principal scores were as follows:—

Name.	Killed.	Name.	Killed.
Radin	6	Ireland	4
Van Wyck	6	Wynn (27 yards)	4
Talbot	5	Patterson	4
Wingate	5	West	4
Hayes	5	Harris	4
Rogers	5		

THE TIE.

Name.	Score.	Killed.
Radin	1 0 0, 0 0 1, 0 1 1, 1 1 1	7
Van Wyck	0*0 1, *0 1 0, 1 1 0, 0 1 0	5

Referee, Mr. Porks.

MICHIGAN.—The State Championship Medal was shot for at the Hamtramack Driving Park, Detroit, on the 20th ult., the conditions being 15 birds each, 21 yards rise, 80 yards boundary. Mr. Mack won by the very excellent score of 14 birds, notwithstanding the fact that the wind was blowing a gale. The following are the scores:—

Name.	Total.	Name.	Total.
G. Moran	5	J. E. Long	3
E. H. Gilman	12	C. H. Mack	14
J. Conliff	13	A. Vandnzer	3
J. V. D. Eldridge	8	H. Whipple	3
L. Dubois	6		

SHOOTING AMONG THE SEA ISLANDS.

PORT ROYAL, S. C., April 15th, 1876.

EDITOR FOREST AND STREAM:—

Thinking a few notes from this quarter may be acceptable at this time, I will give the result of my observations the past few days. Some ten days since, while supervising planting operations hard by my Mansion House, with gun in hand destined for such daring rabbits as might presume to show themselves near my early peas, a flock of birds passed high overhead, and tempted me to risk one barrel charged with No. 6 shot. Quite unexpectedly the lead did its work, and down fell almost at my feet two mallard godwits, heavy, fat birds, in perfect spring plumage. This species of wader is always the first to arrive from Florida, say about March 20th to 25th. For some days my attention had been attracted to their increasing numbers, and I only regretted the absence of northern friends or visitors to take advantage of the flight. The birds were sufficiently good when served to elicit from my better half the expression of a wish for more of the same sort. Having no choice left me but to obey orders, I rose early on the morning of Tuesday, 11th inst., took down my basket of bird skins (the best kind of decoy) from the nail where it had peacefully rested some four months, and with gun on shoulder and basket slung on gun, proceeded to one of my favorite posts less than a mile distant, and set out the cheats I found the blind in good condition, and substantially as I had left it last December. Not so the tide, which crept up at a snail's pace, reached only an infinitesimally small altitude, and utterly failed to drive the birds from their feeding grounds onto the upper marshes as I had anticipated. Another disadvantage, there was no air stirring—bad for birds, good for sandflea, which latter were quickly disposed of by one or two applications of tar and pennyroyal, *Proutys formula*, of course. In one minute after my arrival I was ready for such business as might offer, nor had I long to wait. Quickly resounded in the distance the well-known unspellable cry of the godwit, and in thirty seconds more five of these handsome birds were inspecting my lures. Two remained behind, forever separated from their luckier companions. In a few moments this bit of history repeated itself, except that the number of visitors was one less. Poor godwits in five minutes was encouraging, and a breathing spell of ten minutes or more developed the fact that willets were on the wing. Three scaled over my stools, of which I secured only one. Dull times crept on apace, and full fifteen minutes were scored on the scroll of time with no results. The monotony was at length broken by a Jack curlew lighting to his kindred (as he thought). Alas! poor Jack! His lines were not cast in a pleasant spot just then. A second willet or stone curlew (single bird) joined the innumerable caravan a few minutes later, then times were dull indeed. Patience became the supremest virtue, until at length a solitary black-breast flew confidingly almost in my very face, just as I had concluded my preparations for returning to the comfort of slippers, fragrant mocha, etc. This bit of fortune was thankfully received, but failed to shake my resolution, and I deliberately turned my back on the feathered tribe, knowing well that the tide had still a full hour to run, and would be likely to afford some chances within that hour. I arrived at the house at nine o'clock, having been absent just two and a half hours, and shortly after three of my eight birds were gracing the breakfast table.

Up to this date few birds have arrived. The general flight ordinarily commences here about 20th of April, and good sport can be had in this vicinity up to the 1st of June. Few sportsmen visit this locality at present, but it is to be hoped that before long some of them will find out that there is a Sea Island region to visit as well as a Florida marsh, nearer home, and easier of access.

Our orange trees are loaded with incipient fruit, not having been injured in the slightest by the frost. Early vegetables sufficient to some extent, particularly the potato crop. But it should be known that a frost killing in its effect at Charleston and Savannah, generally passes lightly over the entire Port Royal region, owing to the influence of the vast body of salt water and salt marshes, which divides the Sea Islands in every direction from each other, and from the main land. This fact alone gives the skillful cultivator a great advantage over his Charleston and Savannah competitors. RUSTICUS.

Rational Pastimes.

CRICKET.

—A club match of the St. George Cricket Club was announced to be played on its opening day, May 3d, a report of which we shall hope to give next week. George Giles has been re-engaged as professional, and will have charge of the ground and club house. The ground will be open for practice on Tuesday, Wednesday, Thursday and Saturday throughout the season. A club match is proposed for every Wednesday afternoon, till middle June, and on Saturdays thereafter. The ground, at the west end of Ninth Street, Hoboken, can be reached by Union Hill or Washington Street cars *via* ferries, foot of Barclay or Christopher Streets.

The following are the officers of the club for 1876:—President, James T. Soutter; Vice-President, George T. Green; Treasurer, Franklin Satterthwaite, 10 Pine Street; Secretary, D. B. Gilbert, 78 Broadway, Soutter & Co.; Committee, A. H. Gibbes, J. B. Sleigh, E. H. Moeran, Berkeley Mostyn, M. H. Talbot.

BASE BALL.

—The championship season of 1876 has opened with some brilliant field displays, and the crowds attendant upon the opening games of the campaign have been unusually large. In the west the reserved seats kept for ladies have been crowded, but here in the Metropolis we have had no lady spectators. At Philadelphia last seasons gambling proceedings drove the fair sex away. This year gambling is prohibited, and ladies are admitted free, two rules which will probably lead to the ladies stand at the Athletic grounds being once more thronged as of old.

—Eleven games of the League pennant series have been played during April, and of these Chicago has won more than any other city's team and thus far takes the lead, and it is one evidently merited, by good play and creditable deportment. Next to the "Whites" the Cincinnati "Reds" have loomed up as formidable opponents of the other seven League clubs, the new Louisville nine having thus far been driven to a rear position. In the East the contest for the leadership has been more even, Boston leading in one games, with the others about on a par, though Mutual stock has the call in the local betting markets. Appended is the record for April:—

April 5—Philadelphia vs. Kliucz, at Philadelphia.....8 to 6
April 12—Harvard vs. Lowell, at Lowell.....3 to 1
April 14—Boston vs. Now Haven, at New Hoven.....4 to 1
April 15—Athletic vs. Centeonial, at Philadelphio.....8 to 4
April 15—Cincinnoti vs. Star, at Covington.....7 to 4
April 17—St. Louis vs. Stocks, at St. Louis.....3 to 1
April 17—New Haven vs. Live Oak, at Lynn.....6 to 4
April 19—Bostoo vs Harvard, at Boston.....6 to 2
April 19—St. Louis vs. Red Stocking, at St. Louis.....5 to 3
April 19—Confidence vs. Magic, at New Ilochulle (10 inns.).9 to 8
April 20—Louisville vs. Amateur, at Louisville.....4 to 3
April 21—Boston vs. New Haven, at New Haven.....9 to 8
April 21—Philadelphia vs. Quickstep, at Washington.....6 to 2
April 22—Boston vs. Athletic, at Philadelphia.....6 to 5
April 22—Live Oak vs. Harvard, at Lynn.....9 to 8
April 22—Quickstep vs. Brandywine, at Wilmington.....7 to 0
April 22—Philadelphia vs. Active, at Reading.....9 to 0
April 22—Hartford vs. Yale, at New Haven.....3 to 1
April 22—St. Louis vs. Red Stockings, at St. Louis.....4 to 0
April 25—Chicago vs. Louisville, at Louisville.....4 to 0
April 25—Cincinnoti vs. St. Louis, at Cincinnati.....2 to 1
April 25—Boston vs. Mutual, at Brooklyn.....7 to 6
April 26—Boston vs. New Haven, at New London.....7 to 6
April 26—Allegheny vs. Xantha, at Allegheny.....7 to 6
April 27—Cincinnati vs. St. Louis, at Cincinnati.....5 to 2
April 27—Athletic vs. Philadelphia, at Philadelphia.....6 to 1
April 28—Mutual vs. Hartford, at Brooklyn.....5 to 3
April 29—Harvard vs. Live Oak, at Lynn.....9 to 8
April 29—Hartford vs. Boston, at Boston (10 innings).....3 to 2
April 29—St. Louis vs. Louisville, at Louisville.....6 to 2

PHILADELPHIA, May 1st, 1876.

EDITOR FOREST AND STREAM:—

The cricket season opened on Saturday with a match between the Germantown and Philadelphia Clubs on the Germatown grounds. The Germantown went first to the bat, and scored 123, Large making 21, Joe Hargreaves, 18; R. N. Caldwell, 32; and Wickham, 11. The other figures did not reach the doubles. The Philadelphias made but 32, 15 of which were to A. C. Baird's score and 5 extras. They went again to the bat, and made a much better stand, E. Hopkinson making 44 runs, but the game was a one inning match, and game was called leaving the score as above. Next Saturday there will be a return match. The attendance was good, the ladies liberally lending the encouragement of their presence to the field. SCULLS.

ABOUT SCARECROWS.—Now that the planting season is at hand, we have no doubt but that many a farmer will rummage through his garret to find the cast-off garments, which, stuffed with straw, are to be set up in the cornfield to warn off the marauding crow. We have never had much faith in this artifice. Crows are possessed of much more wisdom than is generally credited to them, and while an immovable bundle of rags may drive them away for a short time, we believe that eventually they discover the humbug, as we have seen the birds complacently picking up young corn almost within the shadow of as an elaborate a stuffed scarecrow as ever was erected. We, however, have heard suggested a couple of plans which are calculated to intimidate even the boldest of these birds, and as they are easily carried out, perhaps our farmer readers may make use of them. The first and best is a suspended looking-glass. Take two small cheap mirrors, fasten them back to back, attach a cord to one angle and hang them from an elastic pole. When the glass swings in the wind the sun's rays are reflected all over the field, even if it be a large one; and even the oldest and bravest of crows will depart precipitately should one of its lightning flashes fall on him. The second plan, although a terror to crows, is especially well suited to fields subjected to the inroads of small birds and even chickens. It involves an artificial hawk made from a big potato, and long goose and turkey feathers. The maker can exercise his imitative skill in sticking the feathers into the potato so that they resemble the spread wings and tail of the hawk. It is astonishing what a ferocious-looking bird of prey can be constructed from the above simple materials. It only remains to hang the object from a tall bent pole, and the wind will do the rest. The bird makes swoops and dashes in the most headlong and threatening manner. Even the most inquisitive of venerable hens has been known to hurry rapidly from its dangerous vicinity, while to small birds it carries unmixed dismay.—*Scientific American*

ANNOUNCEMENTS.

A NEW AMERICAN WORK ON ANGLING.—The whole brotherhood of anglers will be gratified to learn that the somewhat venerable George Dawson, Esq., of the Albany *Journal*, whose fame as an unmidextrous and single-handed fly-tosser is great, is about to issue a book entitled "*The Pleasures of Angling with Rod and Reel for Trout and Salmon.*" American angling literature is so meagre and so inadequate in its instructive capacity and scope, that any work which promises something like standard excellence will be received as bread from the ravens. There is no work extent, as we have often said, that fully meets the requirements of the novice; nothing that adequately impresses upon the infant class in angling just what they have to learn, or imparts the A B C in such a simple manner that each scholar can grasp the familiar letters into words, and from the words into silvery lines that shall satisfactorily play their part in the little history of a week's vacation in the mountains. Nor do we understond that Mr. Dawson claims this to be a complete Vade Mecum, or wishes it to be considered so; yet, from what we have read from its chapters, many of which have been drawn upon largely by our own and other papers from the columns of the Albany *Journal*, in which they recently appeored, we are convinced that it supplies in great degree the want that has been felt so long, and we feel as if we could envy the author his opportunity and seeming prerogative. By a masterly nee of the rod, he has been enabled to inculcate truths into dunces and blockheads which they never dreamed existed; while old-time pedagogues have looked on in admiration of the tact and old-time pedagogues have looked on in admiration of the tact and odd deficiencies.

The book in question will be illustrated, and comprise 365 pages, besides introductory matter. We hope to receive it from the press within a fortnight—a most timely presentation.

FUR TRADE OF MANITOBA—Winnipeg is the principal centre of the fur trade of the northwest. In the past a large portion of the shipment of fine furs was made by way of Norway House, and the majority of the robes found a market by way of Benton, on the Missouri River, in the United States—especially since the buffalo herds have been driven by settlement south of the Saskatchewan. The tendency of present influences, however, is to draw the bulk of the catch in British territory in this direction. The Hudson Bay Company, instead of forwarding their shipments by way of Norway House to England, will in future ship mostly by way of steamer down Lake Winnipeg, to be transhipped at this point via Lake Superior to Montreal, where the annual sales are now held; nor will the trade in fine fur be wholly confined to them, as Kew, Stobart & Co., the Northwest Trading Co., and a few others are displaying in their operations that energy and enterprise which commands success, having established posts in all directions farther than any independent traders ever before ventured. The trade in buffalo robes, now known as the Bow River trade, is, under various opportune circumstances, placed within our reach at the present time, notably by the operations of the Dominion tariff, and the fact that our traders have followed the buffalo into their last stronghold on Bow River, they and the mounted police carrying with them to the Benton traders the first news of the existence and enterprise of the merchants of the capital of Red River. Few have any idea of the vastness of this interest and the amount of money expended here for furs; but some idea may be had from the fact that the entries of fur exports at this port alone amounted for the year ending June, 1875, to $588,958.—*Winnipeg (Manitoba) Free Press.*

HURST'S
Stereoscopic Studies
OF
Natural History
FOR OBJECT TEACHING IN SCHOOLS
And
PARLOR ENTERTAINMENT.

We are prepared to furnish the first sixty numbers of the first series of

Animals and Birds of North America.

To these will be added a second series of foreign specimens, and various animals and birds in grotesque attitudes, never, however, violating their natural instincts.

We offer these views, not as pictures only, but as studies from nature. One of the great moving elements in our modern system of education is object teaching. The unerring fidelity of the stereoscope transfers the animals and birds from their natural habitat to the rooms of the student and the fireside of our homes, where they cannot fail to have a lasting impression of the form, color, habits, and locality of each specimen.

An experience of more than twenty-five years as Taxidermist of the New York State Cabinet of Natural History, and in gathering his large collection of native and foreign specimens, enables Mr. Hurst to combine in every view the locality of the specimen, with its appropriate rocks, woods, or water, and coloring from the originals.

CORNELL UNIVERSITY,
ITHACA, March 14th, 1876.
I most congratulate you upon your great success in this new educational enterprise. If we can arrange our amusements so as to make them impart instruction to the mind, it will be a step in advance in education. EZRA CORNELL.

Prices: By the Dozen.....$3 00
By the Set of 5 Dozen, in Elegant Case, 16 00
These Stereoscopes are sold wholesale and retail by
Forest and Stream Publishing Comp'y,
17 Chatham st., (City Hall sq.) P. O. box 2832.

SUBSCRIBE FOR THE
SCIENTIFIC FARMER.

A 16-Page Quarto, issued monthly, and full of original reading matter. It is devoted especially to science, as applied to agriculture, and is the only journal in the world published with this avowed object.

It records all true progress in agriculture, and the latest results of scientific research. Chemistry, botany, veterinary practice, natural history, farm mechanics, rural art and architecture, rural law and entomology, are all prominently considered in its columns.

AMONG ITS CONTRIBUTORS ARE:

President W. S. Clark, of the Massachusetts Agricultural College, who has few equals as a writer on scientific matters.

Prof. C. A. Goessmann, who is acknowledged to be the first agricultural chemist of America.

E. Lewis Sturtevant, author of the "Ayrshire Cow," the "National Ayrshire Herd Book," &c.

A. S Packard, Jr., editor of the "American Naturalist," and State Entomologist of Massachusetts.

Prof. N. Cressy, who is one of the foremost of our veterinarians, and is State Veterinary Surgeon of Connecticut.

Prof. Levi Stockbridge, whose experiments in cropraising, by special fertilizers, have created astonishing public interest.

Jos. N. Sturtevant, Esq., South Framingham.
Richard Goodman, Esq., Lenox.
Prof. J. Wilkinson, Baltimore.
Prof. H. W. Parker, Massachusetts Agricultural College.
Prof. S. T. Maynard, Massachusetts Agricultural College.

FOR SALE, OR TO LET.

The elegant country residence, WILLOW LAKE, at Locust Valley, near Glen Cove, Long Island.

Suitable for Summer Boarding-House.

The house is 2½ stories, frame, 40 feet front and 36 feet deep, with wide piazza front, rear, and on south end. On first floor are parlors, sitting-room, and dining-room; wide hall through the centre. Up stairs are 9 bed-rooms, all large and airy; kitchen well-arranged and convenient; cellar large and dry.

On the premises, and at convenient distance from the house, are a stable and carriage house, chicken-house, shed, coal, tool, and ice houses. The grounds are well laid out and tastefully planted with ornamental trees and shrubbery. The avenue leading from the road to the house skirts a beautiful lake, on the border of which the house stands. A Paper Mill at the north end of the lake will be sold with the above, subject to a lease. The lake and land embrace about 27 acres. As a place of residence it is elegant and healthy; for manufacturers it is convenient; for the propagation of trout, for pleasure or profit, there is no better place in the State. Apply to
R. FRANCIS,
mch2 6m 47 Broad street, New York.

Board During Centennial
IN PHILADELPHIA.

A FEW SELECT TRANSIENT AND PERMAnent parties can be accommodated by a private family, strictly first-class, with reasonable charges. Rooms can be engaged for the whole or any portion of Exhibition term. The house is situated within 12 minutes of the Centennial Grounds, and 20 minutes from the business centre of Philadelphia.

Any ticket ($2.25), via Pennsylvania Railroad, for Germantown Junction station, which is distant only 200 yards from the house. Address
L. GARVER, 2008 N. 16th St., Philadelphia.
Reference: Wm. C. Harris, Forest and Stream, New York City. apl20 tf

THE BLOOMING GROVE PARK CLUB House will be opened for members and their families on JUNE 1st, 1876. Board for the season at the usual moderate prices. Permits, with fishing and shooting privileges, will be issued to parties desiring to visit the Park. Office, 37 Park Row, Room 23.

apl27 4t Supt. at Club House.

Hotels and Resorts for Sportsmen.

THE "FISHING LINE."
THE
Brook Trout and Grayling Fisheries
OF
Northern Michigan,
VIA THE
Grand Rapids and Indiana Railroad.

(Mackinaw, Grand Rapids & Cincinnati Short Line.)

The waters of the Grand Traverse Region and the Michigan North Woods are unsurpassed, if equalled, in the great abundance and variety of fish contained.

Brook Trout abound in the streams, and the famous American Grayling is found only in these waters.

Brook Trout Season opens May 1st.
Grayling Season opens June 1st.

Black Bass, Pike, Pickerel, and Muscalonge are also found in large numbers in the many lakes and lakelets of this territory. The sportsman can readily send trophies of his skill to his friends or "Club" at home, as ice for packing fish can be had at many points.

Take your family with you. The scenery of the North Woods and lakes is very beautiful. The air is pure, dry, and bracing, and the climate peculiarly beneficial to those suffering with hay fever and asthma.

The Hotel Accommodations, while plain, are, as a rule, far surpassing the average in countries new enough to afford the finest of fishing.

On and after June 1st Round Trip Excursion Tickets sold to Points in Grand Traverse Region, and attractive trips facilities offered to tourists and sportsmen; also on and after July 1st Mackinaw and Lake Superior Excursion Tickets

Dogs, Guns, and Fishing Tackle Carried Free at owner's risk.

Camp Cars for Fishing Parties and Families at low rates.

It is our aim to make sportsmen feel "at home" on this route. For Tourist's Guide, containing full information as to Hotels, Boats, Guides, &c., and accurate maps of the Fishing Grounds, Send to Forest and Stream office, or address

J. H. Page, C. P. & F. A.,
may4 4m GRAND RAPIDS, MICH.,

THE SPORTSMEN'S ROUTE.
Chicago & Northwestern Railway.

This great corporation now owns and operates over two thousand miles of road, radiating from Chicago. Like the fingers in a man's hand, its lines reach in all directions, and cover about all the country north, northwest, and west of Chicago. With one branch it reaches Racine, Kenosha, Milwaukee, and the country north thereof; with another line it pushes through Janesville, Watertown, Oshkosh, Fond du Lac, Green Bay, Escanaba, to Ninagunee and Marquette; with another line it passes through Madison, Elroy, and for St. Paul and Minneapolis; branching westward from Elroy, it runs to and through Winona, Owatonna, St. Peter, Mankato, New Ulm, and stops not until Lake Kanaska, Dakota, is reached; another line starts from Chicago and runs through Elgin and Rockford to Freeport, and, *via* the Illinois Central, reaches Warren, Galina and Dubuque, and the country beyond. Still another line runs almost due westward, and passes through Dixon, Sterling, Fulton, Clinton (Iowa), Cedar Rapids, Marshalltown, Grand Junction, to Council Bluffs and Omaha. This last named is the "GREAT TRANS-CONTINENTAL ROUTE," and the pioneer overland line for Nebraska, Colorado, Utah, Idaho, Montana, Nevada, California, and the Pacific Coast. It runs through the Garden of Illinois and Iowa, and is the safest, shortest, and best route to Omaha, Lincoln, and other points in Nebraska, and for Cheyenne, Denver, Salt Lake City, Virginia City, Carson, Sacramento, San Francisco, and all other points west of the Missouri River.

TO SPORTSMEN:

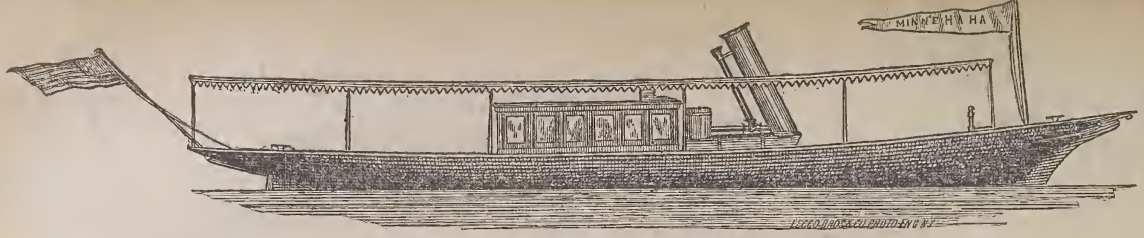
THIS LINE PRESENTS PECULIAR ADVANTAGES—FOR PRAIRIE CHICKEN, DUCK, GEESE, AND BRANT SHOOTING, THE IOWA LINE TO-DAY OFFERS MORE FAVORABLER POINTS

than any other road in the country, while for Deer and Bear Hunting, and for Brook Trout, Lake Salmon, Pike, Pickerel, and Bass Fishing a hundred points on the Northern and Northwestern lines of this company will be found unsurpassed by any in the West.

MARVIN HUGHITT, V. H. STENNETT,
Gen. Supt., Chicago. Gen. Pass. Agt., Chicago.
apl6

TO SPORTSMEN:

THE PENNSYLVANIA R. R. COMP'Y
Respectfully invite attention to the
Superior Facilities
afforded by their lines for reaching most of the TROTTING PARKS and RACE COURSES in the Middle States. These lines being CONTINUOUS FROM ALL IMPORTANT POINTS, avoid the difficulties and outgoes of reshipment, while the excellent cars run over the smooth steel tracks enable STOCK TO BE TRANSPORTED without failure or injury.



The lines of
The Pennsylvania Railroad Company
also reach the best localities for
GUNNING AND FISHING
in Pennsylvania and New Jersey. EXCURSION TICKETS are sold at the offices of the Company in all the principal cities to KANE, RENOVA, BEDFORD, CRESSON, RALSTON, MINNEQUA, and other well-known centers for
Trout Fishing, Wing Shooting, and Stiff Hunting.
Also, to
TUCKERTON, BEECH HAVEN, CAPE MAY, SQUAN, and points on the NEW JERSEY COAST renowned for SALT WATER SPORT AFTER FIN AND FEATHER.

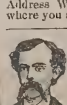
BUY IT Vanity Fair.
It is shaved from the best Natural Leaf, for Meerschaum and Cigarettes. Does not make the tongue sore. Sample on receipt of 20 cents. Highest award, Vienna, 1873. Send for circular. WM S. KIMBALL & CO.,
PEERLESS TOBACCO WORKS, Rochester, N. Y.

From Seth Green, Supt. N. Y. State Fisheries.
I find Vanity Fair to be the best article of tobacco adapted to the wants of the sportsman. Have used your tobaccos for many years, and know them all to be first class.

For Sportsmen.
A trusty friend, in weariness or trouble; a solid resource in Winter and rough weather, is a sweet pipe with Vanity Fair. Best dealers have it.



From A. B. Lamberton, Rochester.
Having smoked your tobacco, Vanity Fair, by the camp fire and by the hearth, I believe it in point of fragrance and taste superior to all brands known to me. Being in search of a tobacco that would not fire the tongue and mouth, I was made acquainted with your Vanity Fair, and found it to be the *ne plus ultra* of natural leaf.

For Cigarettes.
A cigarette is an interlude to the serious habit; a graceful make believe for spare hours. For cigarettes Vanity Fair has no equal. Best dealers have it.

From Forest and Stream, N. Y.
We have received from Messrs. Kimball & Co., of Rochester, some choice specimens of their celebrated Vanity Fair tobacco in neat metal cases holding a pound each; and, after most thorough trial, do not hesitate to concede to it all the good qualities which its manufacturers claim for it. It is a most superior article, and a great comfort to discriminating smokers.

THE
PAPER STEM PIPE,
Just the Thing for Home and Camp Use.
Supplies a want which smokers have long felt—a pipe which shall give simply the taste and odor of tobacco smoke. This pipe never accumulates rank smelling liquid in stem or bowl, but is always clean and sweet. The bowl and mouthpiece are permanent, but the stem is of porous paper, to be laid aside after a few days' use and a new one fitted. Extra stems accompany each pipe. The price of extra stems, when not furnished with the pipe, is as follows: Four and a half and seven inches, 5c.; twelve inches, 10c. Sold by pipe and cigar dealers generally, or a complete sample sent by mail for $1 by
J. H. Hubbard,

GUNPOWDER.
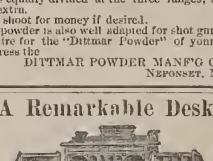
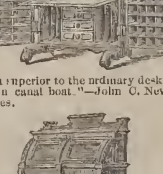
Dupont's
SPORTING, SHIPPING AND MINING
POWDER.
DUPONT'S GUNPOWDER MILLS
(ESTABLISHED IN 1801),
Have maintained their great reputation for 75 years. Manufacture the Celebrated
EAGLE DUCKING, EAGLE RIFLE, AND DIAMOND GRAIN POWDER.
The most Popular Powder in Use. Also,
Sporting, Mining, Shipping and Blasting Powder
Of all kinds and descriptions.
For sale in all parts of the country. Represented by
F. L. Kneeland,
Feb 10-1y 70 Wall Street, New York.



The Hazard Powder Co.,
MANUFACTURERS OF
Gunpowder.
Hazard's "Electric" Powder.
Nos. 1 (fine) to 5 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. *only.*
Hazard's "American Sporting."
Nos. 1 (fine) to 3 (coarse). In 1 lb. canisters and 6¼ lb. kegs. A fine grain, quick and clean, for upland and prairie shooting. Well adapted to short guns.
Hazard's "Duck Shooting."
Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6¼ and 12½ lb. kegs. Burns *slowly* and very clean, shooting remarkably close, and with *great penetration.* For field, forest and water shooting it ranks any other brand, and it is equally serviceable for muzzle or breech loader.
Hazard's "Kentucky Rifle."
FFFG, FFG, and "Sea Shooting" FG, in kegs of 25 12½, and 6¼ lbs. and cans of 5 lbs. FFFG is also packed in 1 and ¼ lb. canisters. Burns strong and *moist.* The FFFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard *Rifle* powder of the country.
SUPERIOR MINING AND BLASTING POWDER.
GOVERNMENT CANNON AND MUSKET POWDER; ALSO SPECIAL GRADES FOR EXPORT, OF ANY REQUIRED GRAIN OR PROOF MANUFACTURED TO ORDER.
The above can be had of dealers, or of the Company's agents in every prominent city, or wholesale at our office.
88 Wall Street, New York.

Bound Volumes
OF
Forest and Stream.
FIFTH VOLUME NOW READY.
Price, $4.00.
A complete set of the FOREST AND STREAM, five volumes, bound handsomely in cloth—a valuable library for the sportsman—can now be obtained on application to this office.



Orange Sporting Powder.
ORANGE LIGHTNING POWDER,
The *strongest* and *cleanest* Powder made. Nos. 1 to 7, packed *only* in sealed 1 lb. canisters. The coarser sizes (higher numbers) especially are recommended to owners of fine breech-loading guns, giving great penetration with very slight recoil.
ORANGE DUCKING POWDER,
For water fowl. Very strong and clean. Nos. 1 to 5. Packed in metal kegs of 6¼ lbs. each, and in canisters of 1 and 5 lbs.
ORANGE RIFLE POWDER,
The best for rifles and for all ordinary purposes. Sizes F, FF, FFF, the best being the finest. Packed in wood and metal kegs of 25 lbs., 12½ lbs., and 6¼ lbs., and in canisters of 1 lb. and ¼ lb.
All of the above give high velocities and less recoilum than any other brands made.
BLASTING, MINING, AND SHIPPING POWDER OF ALL GRADES AND SIZES PACKED IN WOOD OR METAL KEGS OF 25 LBS.
SAFETY FUSE AND ELECTRICAL BLASTING APPARATUS.
LAFLIN & RAND POWDER Co.,
26 Murray St., N. Y.
Sole proprietors and manufacturers of the celebrated ORANGE brand of GUNPOWDER. Recommended and used by Capt. A. H. BOGARDUS, the "Champion Wing Shot of the World."

CHALLENGE.
The undersigned is prepared to prove all the superior qualities he claims for his powder.
Safety, Cleanliness, Strength, Little Recoil, Little Smoke, Small Report, Less Heating of the Barrel in Rapid Firing, and its Regularity in Shooting.
He challenges all riflemen to shoot against him with black powder, 200 rounds, without wiping; 100 rounds off-hand, at 200, 500 and 1,000 yards respectively, and 100 rounds in any position at same distances; the 200 rounds equally divided at the three ranges; sighting shots extra.
Will shoot for money if desired.
The powder is also well adapted for shot guns.

W. H. HOLABIRD

Would most respectfully announce to his patrons and friends that he is prepared to make

Shooting and Fishing Suits

at the above prices. The ten dollar suit is better made than any competitor can offer for the same money. My original design having been appropriated by other manufacturers, I have been compelled to make many changes in the arrangement of pockets, &c., for which I have to thank the fraternity at large for suggestions. I believe that I have the

BEST SHOOTING AND FISHING COATS IN THE WORLD,

and respectfully solicit your orders. I send my new Illustrated Catalogue, 16 pages, free on application.

Dealers will find it to their advantage to handle my goods. They are better known and more highly esteemed than any other make.

THE NEW

BOSTON

SHOOTING SUIT,

Manufactured only by

G. W. SIMMONS & SON,

Boston, Mass.

We offer this season an entirely new design of WATER-PROOF SHOOTING SUIT (made from extra quality duck), in the preparation of which we have been assisted by the advice and suggestions of our best resident sportsmen.

The design embraces the best points of the English and French Suits, combined with the necessary requirements for American service. Particular attention has been paid to color.

Each suit is thoroughly water-proofed by a new patent process. The seams and pocket corners being securely fastened, the arm holes ventilated, and nothing neglected to render the suit perfect in every respect.

The price has been fixed at $13, to include Hat or Double Visored Cap, Detachable Haverlock, Coat, Vest, and Pantaloons.

One hundred suits will be kept ready in stock, so that we can furnish to order any size required, at a moment's notice.

In the *Golden Rule* (Rev. W. H. H. Murray's paper) the enthusiastic editor writes:—

"We were shown, the other day, a new water-proof suit, specially adapted for sportsmen, designed and made up by Simmons & Son, of Boston, and to which we call the attention of all brethren of the out-door and shore-shooting fraternity, because it meets the demand of personal comfort and convenience beyond anything of home manufacture seen by us before. As a sportsman, we give it our unqualified endorsement, as combining the best points of the English suits, and in addition skilfully adapted to the necessities of the American service. It is a most admirable and satisfactory contrivance in color, style, waterproof quality and capacity. The coat is a marvel in this latter respect."

Persons ordering from a distance need send only the following to be sure of a perfect fit:—Waist Measure, Height, Breast Measure, Length of Sleeve, Size of Head.

Sharps New Long Range Rifle.

Paper and Metallic Shells

FOR

Breech Loading Shot Guns,

Manufactured by the

UNION METALLIC CARTRIDGE CO.,

BRIDGEPORT, CONN.

THE STURTEVANT SHELLS are the easiest reloaded. Do not have to unscrew the head nor use an awl to remove the exploded caps. THE PATENT MOVABLE ANVILS, made of steel wire, will not bend or break.

THE BERDAN PATENT SHELLS, new model, with Hobbs' patent waterproof primers, never miss fire, and are highly prized by all that have used them.

PAPER SHELLS.—By repeated experiments and great outlay for improved materials, and machinery made expressly for the purpose, we can now warrant our BROWN PAPER SHELLS equal to any imported. They are sure fire, and will not burst in the gun.

Inquire of any of the dealers in sporting materials for the U. M. C. Co.'s Shells.

Not sold at retail by the manufacturers. dec23 tf

Hart's Sportsman's Favorite Metallic Shells for Breech Loading Shot Guns.

These Shells are easily loaded, and the caps easily extracted from inside. Head solid, and much thicker than any shell now made, giving a solid seat for cone or anvil, which prevents it from drying through or springing away, thereby causing misfires. The cone is made of nickle and fastened solid in its place. It neither rusts or corrodes fast like movable anvil made of steel. The nickle cone also prevents misfire when cap has been left on shell for a few days, which is liable to occur either in steel or iron. These shells are finely finished, and made any length ordered, from 2½ to 3½ inches.

Shells and Loaders, and description Price Lists, can be obtained from all the leading sportsmen's houses throughout the country. GEO. E. HART & CO., 363 and 365 Market st., Newark, N. J.

From Captain Bogardus, Champion Wing Shot of America.

MESSRS. GEORGE E. HART & CO.,

Gentlemen—The fifty shells I received from you to-day suit me better than any I have ever used. They are stronger and better in every respect, and I shall use them in all my shooting hereafter. Yours truly,

may18-1y A. H. BOGARDUS.

Third Edition.

Camp Life in Florida.

By CHARLES HALLOCK,

AUTHOR OF THE FISHING TOURIST.

This is a most seasonable book for Sportsmen, Tourists, Invalids, and Settlers, and has been long needed by Winter tourists to Florida and persons seeking settlement there. It gives a full classification of the game and fish of the Southern Peninsula, routes of interior and coastwise travel, the agricultural resources of the country, and cities for settlement, hints for camping out, resorts for game, hotels, and such other information as will be of great benefit to visitors seeking Florida for health, pleasure, exploration, or permanent settlement.

348 pp., 12mo. Price, $1 50.

CONTENTS:

Introductory Chapter.
Birds-eye Glance at Florida.
Outfit for Sportsmen.
Hints for Southern Hunting.
Coastwise Routes of Travel.
Game Animals and Birds of Florida.
Game Fish of Florida.
Three Months in Florida for One Hundred Dollars.
Supplementary Hints for Cheap Recreation.
Up the St. John River.
Indian River.
Florida the Promised Land.

CHAMPION GUNS OF ENGLAND

PAPE'S

Unrivalled Sporting Guns.

Stand unequalled in every contest. Their performance at the London Trials of 1875 beats the records of any maker in the world.

1875. 12-Gauge, Choke Boring.

Maker of Gun.	Exhibitor.
1st—Greener	Greener.
2d—Pape	Davidson.
3d—Pape	Pape.

Out of a class of 68 guns, 3 out of the 6 best were made by Pape. The Greener gun was protested against on the spot for having its score false counted, the fact proven there, and afterwards confirmed by same gun being shot for two days per week for six weeks in succession, when its average score only took 24th place, its very best score being greatly below the scores of the best six guns.

1875. 12-Gauge, Old Sporting Bore.

Maker of Gun.	Exhibitor.
1st—Pape	Davidson.
2d—Pape	Davidson.

1875. Long Range, 60 yards. Choke Bores.

1st—Pape	Davidson

60 yards, Long Range, Sporting Boring.

1st—Pape	Davidson

Those champion Long Range guns, only 7 pound weight, with a charge of 3¼ dr. to 1½ oz. shot, beat the best 8 bore Greener gun at 60 yards; weight, 15 lbs.; 6 drachms and 2¼ oz. shot.

1875. The Sportsman's Sub. Cup, valued at £15, was also awarded to W. R. Pape, for the original invention of choke boring. Winner of the London Gun Trials of 1858, 1859, 1866. Address

WILLIAMS & POWELL,

Gun and Rifle Manufacturers,

Call the attention of the Sportsmen of America to the extreme SIMPLICITY, STRENGTH and DURABILITY of their New Patent "SIMPLEX" Breech loader and INDEPENDENT EXTRACTOR.

The parts in this new action are so few (only two,) its mechanical soundness so thorough, and the strength and simplicity of the action so great, that W. & P. feel sure it will supercede all the complicated and manifold grips now in use, its one powerful grip being far stronger than any double, treble or quadruple grip now used. In this new action LEVER and GRIP ARE ONE SOLID PIECE OF STEEL and the ANGLE of the BODY is left in its ENTIRE STRENGTH.

Drawings of action and extractor will be sent on application, and orders may be forwarded through any of the best houses in the States for execution in the Spring.

Guns guaranteed to make patterns of from 160 to 230 with No. 6 SHOT AT 40 YARDS, as desired.

NO. 25 SOUTH CASTLE STREET,
LIVERPOOL.

Hunting Wapiti on the Loup.

AT New Helena we stopped a few days to recruit our horses and prepare the heads of our game for mounting. Here we met a friend, Mr. Mathews, and through him we formed the acquaintance of Mr. James H. Ross, whose hospitality we enjoyed, and whom we induced to accompany and guide us on our trip to the Dismal River, twenty-five miles above.

Setting out from Mr. Ross', one bright morning, we followed the only trail visible, and a dim one it was, made by a party of Government surveyors during the summer, up the Middle Loup to the Dismal. We often saw white-tail deer feeding on the river bottoms, but as they espied our wagon they would dash away with long high bounds to some willow-covered island. Coyotes would perch themselves on some lonely prominence, take a long look, then "silently steal away" in their peculiar sneaking manner. In the sand bars, and flying up and down the river were flocks of wild geese. Ducks of various kinds paddled about in the still water, seeming to care little for our presence. Covies of sharp tail grouse would break the solitude with the thunder of their wings as they rose from their hiding places in the tall grass, making the silence which followed seem almost oppressive.

Reaching the mouth of the Dismal we passed up the stream, about a day's drive, through a country still more dismally dismal. Lonely and desolate it lay, as if never before disturbed by the foot of man. Those lines from the "Ancient Mariner" recurred to me continually;

> "'Twas sad as sad could be,
> We were the first that ever burst
> Into that silent sea."

Just as the sun was passing from sight behind the high sandy bluffs we drove down to a bend in the river and pitched our tent in a small grove of trees at the foot of the bluff, and close to the shallow, swift-running stream, whose low banks being here thickly grassed to the water's edge. On every hand well-worn elk paths and deer trails led back into the hills. Rising early on the morning of Nov. 5th we found the wind in the northwest, bringing clouds of mist, dimming but not obscuring the landscape. Notwithstanding this we arranged that H. and myself should make a detour through the bluffs, while Mr. Ross should hunt above and in the vicinity of the river. Setting out we led our horses over the many ups and downs until we reached the first range of bluffs. When near the summit I took a long survey of the brown grassy valley which stretched before me, and far away on the second range, I saw through the mist two objects which, with the aid of my glass, I decided to be either deer or elk feeding. Leading our horses behind the hill, and driving the picket pins into the loose soil with our heels, we left them to crop the withered herbage while we went forward to take a closer inspection. Keeping out of sight behind ridges we reached the low ground where I once more tried my glass, and how my pulses thumped when I "made assurance doubly sure," and found them to be indeed what I long had sought—elk. One stood on a sharp peak of the chain watchfully scanning the country in search of lurking danger, while his mate fed below on the steep hillside. I could well see that they were both large stags, having fully developed antlers.

While observing with my glass the numerous deep ravines putting out from the range, and trying to decide which to take and how to reach them, the look-out joined his mate, and soon after both laid down. Always choosing good cover, and often plucking the dry grass and tossing it into the air to make sure that we did not give them the wind. Creeping on "all-fours" behind low ridges, and worming ourselves on our stomachs over the more exposed places we reached the ridge on which they were lying. I expected every moment to find myself foiled by jumping a mule deer, as their fresh tracks, made in play that morning were all about, and the many "blow-outs" afforded them their favorite bedding places.

H.'s ambition having been gratified, he here left me to go forward alone. With the aid of grass roots, and by pushing the toes of my boots into the soft sandy soil, I raised myself, inch by inch, until I could see much of the body of one, and the head and antlers of the other, though they were at too great a distance to risk a shot.

Turning to the right, behind a low ridge, I selected a small grassy knoll which lay between me and the quarry. On reaching it, I parted the grass and peered through with my heart thudding industriously, and saw the first elk scarcely twenty yards distant, his body out of sight behind a low bank with only the tips of his horns visible. The other was a little farther removed, and I had only a back view of his head. As I could obtain no better position, I found I must risk a shot from this point. With the intention of calming myself, and to still the rapid heart-throbs, I lay quiet and looked at my game. I counted the prongs on each horn—five fully developed and unbroken points to each beam. The points whitened as if by use, battered perhaps, the beams and other parts of a rich, dark brown. Drawing my hunting hat tightly down, and with extra cartridges in hand, I summoned my energies for the struggle, and slowly rose to a fair view. The click in setting the triggers of my .40 calibre Sharps caused him to swing his head with its wide-branching antlers slowly around, giving me a side view of his glistening eye. Taking a quick aim just below his optic, I fired. The 90 grains of Orange sounded weak! my shoulder did not even feel the usual recoil. On to my feet just in time to see him struggle for an instant on his side, then spring up, and with one great bound disappear over the "break" and out of sight to be seen no more until himself and mate appeared on a distant hillside, where they halted, threw up their magnificent heads and looked back, then taking their long swinging trot were soon out of sight.

Seldom have I felt more despondent, and as H. and myself went for the horses to follow the trail, I felt as if I were doomed to go home without my antlers. H. added to my chagrin, if that were possible, by chiding me for being over cautious. The mist had by this time cleared away, and the sun shone forth brightly as we reached their trail in the mellow sand, and traced them nearly three miles, often finding pools of blood and stained grass. On mounting a range of bluffs H. saw a black-tail deer in its bed, and never having shot one, I loaned him my rifle to try the buck, while I held his horse. On his way to the deer he saw the elk lying down on a distant ridge. Returning without frightening the deer, we again picketed our horses, and using every precaution we succeeded in getting within easy distance where H. again left me to try my fortune alone.

Creeping along the ridge on which they were lying I reached a favorable point from which to shoot. Reaching carefully forward my rifle, and resting the muzzle on a tussock of grass, with hammer drawn back, and heel-plate to my shoulder I slowly raised myself to find my wounded stag with his back toward me as usual. I could see his body dimly outlined through the grass, and I aimed well forward hoping to strike his backbone. Using my rifle without the set I commenced a steady pull. As it cocked the elk sprang to his feet and "took to his heels." Running to where I last saw them I looked over; yes, there he was! standing head down on a hillside, his mate having gone on alone. Dropping quickly to the ground I tried to shoot, but my nerves were so unstrung that I could not have hit an elephant at ten steps, and before I could steady myself he fell, and running to him I found life extinct. With the perspiration streaming from every pore, I leaned on my rifle to rest and admire my prize as he lay stretched out on the brown withered grass. I grasped his antlers, turned his head, and straightened his brown flossy mane, and could hardly make myself believe that I had at last shot an elk. H. joined me, and we ripped him up to his dark bearded throat, removed his entrails, and tied a coat to his horns to keep the wolves away, intending to bring him in the next day. His antlers were of medium size; the foot-stalks and tines were long and symmetrical, every antler perfect and mating well with its fellows.

The next day while we were going with team and wagon to bring in the dead stag, Mr. Ross saw a large band of elk across a divide a mile or more from our stopping place. Turning our team to the wagon we started in pursuit. Taking their trail across the valley; and from the high range of hills succeeding it we could see them far ahead still moving and closely together, not unlike our domestic sheep. When we were about giving up the chase we saw another herd of about seventy-five lying down on a spur to our left. So, turning our attention to this band, and making a long stalk, we were so fortunate as to get within easy rifle range. They were scattered along the hillside singly and in groups, and were mostly cows and calves, though I saw a number of males, having horns of various degrees of development. One, I noticed, had long sabre-like antlers destitute of prongs; a few had short beams and brow antlers, while some old monarchs carried full heads.

While lying to get our breath a lordly stag with five points to each beam, rose to his feet, stretched himself lazily, and turned his gray side toward us. I was to shoot the stag and H. and Ross were to shoot does; through some mistake H. fired before Ross and I could get our positions. The herd sprang up at the shot, huddled close together, and ran at a furious pace over the ridge; though not until Ross had fired a random shot. I could not shoot, lying down, with my game speeding away at such a rate, and in attempting to gain my feet, I slipped, to rise just as the last stag, with his long horns laid over his back, was showing us his clean-shaped heels. Following the flying herd we found a wounded cow standing in the shadow of a steep bank. Almost simultaneously the sharp crack of our rifles rang out, and she fell literally riddled. Ross' random shot had wounded her. Returning to the wagon we loaded the game, and reached camp in good season. We hunted out a few days more, during which time Ross killed a Virginia doe near the river, and H. a mule buck in the hills. The mule deer will, at times, stand and blankly stare while shot at, and if not hit trot off a few steps and turn, giving the hunter another chance. One evening H. had sixteen shots, on different occasions, at mule deer, which acted in this manner: He was then using a carbine having a curved trajectory and a twenty-pound trigger-pull, which I suppose was the reason of his getting only one of the three at which he shot.

On the last day of our hunt we came in early, and long before the shadows crept over the valley we were busy preparing for the homeward journey. One by one the stars shone out, and the full moon rose in the east throwing her silvery light over the great hills and winding river, as we began our supper. Broiling great slices of savory venison, and with steaming potatoes, warm biscuit and coffee, we ate our evening meal in the open front of the white-walled tent, made light and warm by the fire before it. The flames cast long shadows over our game, which were stretched out in full view on the short, thick grass—the antlered stag, the glossy-coated cow, and the symmetrical deer. Our horses came to the canvas-covered wagon, and with low neigh looked wistfully in upon us, asking for their evening feed. Across the narrow valley rose one above another the serrated hills, while nearer, through the trees, came the glimmer of the river, whose low ripplings came to us "like a voice in the night." Several years ago a herd of five hundred Texan cattle stampeded during a storm, and their owner was never able to gather them. They retreated as settlers encroached, and those which have not been killed roam over this country. We saw fresh traces of them while here, but none of the cattle. On our return journey, when near the mouth of the Dismal, we saw a herd of twenty-five wild horses feeding on the bottom, and as they saw us they trotted up to within 300 yards, with heads erect. Then wheeling they galloped slowly away. They were of medium size and mostly bays, and hardly came up to my expectations.

We were gone from home just a month. Hunting less

than two weeks we killed three elk, four mule, and one Virginia deer, besides some smaller game. The antlers attracted much attention and comment as we passed through the many towns which lay on our homeward route. And so terminates our hunt—our dreams were realized, and our hopes merged into full fruition. G. N. B.

Delphos, Ottawa Co., Kansas, March 18th, 1876.

For Forest and Stream.

A SNOW-SHOE TRAMP TO THE SAGUENAY REGION.

THE city of Quebec, founded by Champlain in the year 1608, and the oldest town of importance on the continent of America, stands on a bold promontory at the junction of the St. Charles with the St. Lawrence. On the Quebec side of the river a splendid agricultural country, settled two hundred years ago, and inhabited by a happy, contented, and comparatively prosperous people, stretches from east to west as far as the eye can reach. This country is, however, only a fringe of settlement on the border of the forest. At a distance of ten miles from the St. Lawrence the Laurentian range of mountains, which stretches from Labrador to Lake Huron, appears to bar all settlement, and to indicate that the limit of agricultural development north of the river has been reached.

The vast country which stretches north and west from the Laurentian mountains for five hundred miles to Hudson's Bay remained for many years an unknown territory, frequented only by the Indians and employees of the different fur trading companies. By degrees the reports of the great fertility of the valley of Lake St. Johns, at the head of the Saguenay River, induced settlers to its shores, and notwithstanding the great distance from markets and the difficulty of communication, the Lake St. Johns settlements have flourished and increased in size.

In 1868 the question of a railroad to Lake St. Johns from Quebec, to develop the back country, was agitated, and in 1869 a company was organized, but the means at their disposal was insufficient to build an iron road, so it was decided to lay wooden rails. The line was run a distance of twenty-six miles from Quebec, but as rain, frost, or snow prevented them from running, in consequence of the wheels slipping, it was abandoned after a year's trial. This year (1876) the company has been reorganized under the promise of a grant of $6,500 per mile by the Government, and there is every prospect of its being put through. (*Vide* prospectus St. Johns and Quebec Railroad.)

When the road is opened for traffic it will become a favorite route for sportsmen invalids and summer tourists, for the country abounds in game and all that tends to render a summer in the wilderness enjoyable.

With a view to the above facts, and to indulge my old taste for camp life and sporting, I determined to take a trip through this section and commenced my preparations. I engaged an excellent guide from the village—one Gros Louis by name—secured the genial companionship of C. S. Wolff, Esq., P. M. at Valcartier, and procured a small tent and portable folding stove, besides the other necessaries of camp life. March 17th, '76, we left Valcartier. The first stage of our journey we followed the old railroad track for about twelve miles, passing immense piles of cord wood and logs, which had been cut and drawn to the track, but never taken away. At Lake Claire we took dinner in the comfortable little shanty of Mr. Maxham, of Quebec, a genial gentleman and ardent sportsman. The shanty is built of logs, squared and dressed. The flooring, ceiling, table, and bunks are of hand-sawed spruce, planed and jointed. There is a good stove in it, and many of the comforts of civilized life. A more delightful spot could not have been chosen, combining, as it does, such capital shooting and fishing. The lake is celebrated for the size of its trout, frequently reaching ten pounds in weight. Caribou in early winter are numerous about the lake, and afford good shooting to the man of endurance and pluck, who is good for an all day chase. The caribou is the most difficult of the deer tribe to stalk. It is only by tiring them through the deep snow that you can get within shooting range.

At nightfall, hungry and tired, we reached the first house of the St. Raymond settlement, and were compelled to wait outside until the inmates had finished their *chaplet*, for it would have been a breach of politeness for Protestants to have disturbed them in their devotions. I sat down upon my pack, smoked and listened to the tiresome repetition as each bead was told off. Admittance was at last granted us by the good man of the house poking out his *bonnet rouged* head, and in French inviting us to enter. My first demand was for milk, and I obtained, very luckily, a good bowl, and polished it all off very much to the surprise of the *bonne femme*, and open eyed astonishment of the young fry at the idea any one's asking for milk when good tea was on the stove warming.

Although pressed to remain there for the night, we decided to push on to the village of St. Raymond, and made a bargain with our host to carry us and our traps there, a distance of eight miles, for the sum of one dollar. On our arrival there late, we found every respectable *habitant* had buried himself a foot or two deep under his feather bed, and that all efforts to rouse him from his slumbers were unavailing. While running around one house I fell into a drain dug in the snow. I picked myself out just as Wolff turned the corner. I waited his near approach, and at the right moment I asked him if he saw a light in the upper windows. Innocently he looked up, and at the same moment disappeared with a grunt. I stood there shaking with laughter while he ruefully picked himself out, vowing vengeance against me for the trick I had played him. Our carter also fell into it, and *sacre'd* for an hour afterwards. When every resource had failed us apparently, our *habitant* driver, awakened by his fall perhaps, inquired if we knew a Mr. Hervey, of Quebec, who was stopping somewhere in the village. Know him? of course we did, as who does not, and right away we trotted down the road again, and found that gentleman not retired yet, and delighted to see us. The *bonne femme* is directed by him to prepare us a good supper while we, seated around his wood fire, smoked and chatted over bush matters in general.

Early in the morning we engaged a man to drive us fifteen miles further up the *Bras du Nord* of the St. Anns to Little Saguenay, the last settlement north of Quebec. The day was one of the severest I have ever experienced in Canada, and we suffered fearfully from the cold. Half a dozen times were we compelled to stop at some roadside house to thaw ourselves out. Whenever the wind lulled for a moment, or some sheltered place protected us, we would uncover our heads to obtain a glimpse of the magnificent scenery about us. On both sides of the valley through which we were winding high precipitous mountains, bare to the summit, shut us in, while at intervals falls of water were visible tearing down from their lofty heights and suspendons icicles drooping from every overhanging ledge of rock. Two or three lumber shoots were pointed out to us, and many jagged and split logs attested the fearful race they had run from the top.

Arriving at Delaney's, where we were to stop for the night before taking the bush, we were shocked to hear of the death of one of the family, and to find them in mourning. There was no help for it; we must stay, and so made ourselves as comfortable as the circumstances would allow. During the evening the neighbors began dropping in for the wake, and by ten o'clock it was under full headway. Pipes and tobacco were handed round to the men, and refreshments to the women. Railroad matters were brought up, and quite a warm discussion ensued as to whether a railroad was beneficial to the country or otherwise. Wolff, in the heat of an argument on the affirmative side of the question, leaned so far over on the back of the chair he was straddling that he fell forward into the empty coffin at his feet. A shout went up, and our friend was rescued from his untimely position, smiling as good naturedly as though nothing had happened, and resumed the broken thread of his discourse. The scene was too much for my equanimity, so I retired to bed beside the corpse and slept soundly, despite the noise and confusion, until towards morning, when I was awakened by the monotonous *chaplet* which all were joining in.

The cold had increased during the night, and we were remonstrated with about leaving, but we had decided that night to be in the bush. Crossing the river, we followed it seven miles before a break in the chain of abrupt mountains admitted our striking to the westward. Half way up the mountain night overtook us. Selecting a good place near a little warm spring that we found open, the taboggin is unloaded, tent taken off, and while one tramped down the loose surface snow—for it would be impossible to dig down to the ground with the snow over seven feet deep—another cut tent poles, while the third chopped wood for the stove and broke balsam branches for our bed. The little stove was soon set up, and in half an hour we were comfortably housed for the night, and our damp clothes hanging to the ridge pole to dry. Etienne prepared us a royal supper, to which we did more than ample justice. A lighted candle enlivened the scene, and pencil in hand we traced out the day's journey and made our comments upon the incidents of the day. Our little wood stove proved a perfect success, and during our entire stay in the bush we never suffered from cold in camp. Wood was plentiful, and we did not spare it.

We struck camp early in the morning, and reached the height of land in about two hours, and shortly afterwards struck the first of a chain of lakes, which we followed for the two succeeding days. It is the grandest lake country I have ever visited. The portages are short between them, and with a canoe in summer it would be possible to navigate them for fifty or sixty miles in either direction. They abound in trout of a very large size, so we were told, for we had had no opportunity of judging ourselves. Many of these lakes are extremely beautiful, dotted over with islands and surrounded by gently sloping mountains. At *Lac Cabane Automne* we saw two lakes not a stone's throw from each other, that discharged their waters into two different rivers over fifty miles apart. On reaching the *riviere* Blanche we took dinner. Some balsam trees are cut and split and put on the snow, and on this the fire is started. The surface snow is scraped away on the river, and enough water is collected for our tea. Broken branches made a comfortable dry seat, and we stretched ourselves out to enjoy the genial warmth of the fire, and as a matter of course the accompanying pipe.

The weather still continued very cold, with appearances of a storm. Leaving the *riviere* Blanche, we again struck to the westward. On Lake Breeches, just as we started to cross it, we saw coming on to it from the opposite side a wild looking individual, who, on closer inspection, proved to be our friend John Neilson, Esq., surveyor, whom we were to meet. He had been out six weeks hunting, trapping, and exploring in a semi-official capacity, and at the time we met him he was on his way out, but changed his mind, and decided to go on with us and guide us safely through the maze of lakes as far as *Lac Claire Batiscan*. Shortly after three P. M. we went into camp at the foot of Lake Francois, a large sheet of water.

It was about nine P. M. when a violent gust of wind struck the tent and threatened to tear it from its fastenings. Etienne was hurriedly sent out to doubly secure it. Gust after gust now struck it with a force sufficient to rend it to pieces, but it bravely stood the storm that raged through the night. The snow fell fast and thick, and banked up around us in great drifts. Later I fell into a sound sleep, and never woke, despite the elements at war around us, until daybreak. Sixteen inches of snow Etienne reported in the morning, but we started nevertheless, but had only a faint conception of the fearful snow-shoeing before us that day, or I doubt if we would have left camp. Snow fell all that day, and in crossing the lakes we had first to take our bearings and then start Indian file to preserve a straight line, for it was impossible to distinguish any object fifty feet away. It was too stormy and cold in the middle of the day to stop for lunch, so we resolutely kept on, taking each our turn in breaking the road, for it would have been impossible for one man to have done it alone. Later in the afternoon we reached *Lac Claire Batiscan*, but our troubles had then only commenced. Mr. Neilson's camp was on an island more than a mile distant from the shore, and ours had been left behind at Lake Francois, so reach it we must. Mr. Neilson took the direction as nearly as he could judge, and trusting to our good luck we followed him. It seemed an interminable distance, facing the driving snow, and I feared more than once we had passed it. Just as I began to despair we saw it loom up, during a slight cessation of the wind, directly in front of us, showing how well we had preserved our course. In the comfortable little tent of our friend we forgot all our misery of the day while enjoying his hospitality. We were rather crowded, it is true; five of us in a tent intended only for three; but no matter we were not grumblers at such a time.

The storm lasted until the following day, and thus our calculations for continuing on to the headwaters of the Basticau, Lake Edouard, were completely upset. Our only anxiety was, how should we get out. We made a slight attempt at fishing; but the great trouble was in boring holes, and the wind forced us to give it up after taking eleven fish. The remainder of the time was whiled away in camp—yarning, smoking, and eating.

The seventh day out we packed up to return, leaving behind us much of our provisions, which we feared to load ourselves with on account of the walking. Just as we were leaving camp, two Indians came in with some moose meat as a present to Mr. Neilson, whom they knew. They reported having killed three very fine moose a few miles from the lake shortly before, and were then on the search for two that escaped them at that time. They reported very good success in their trapping and shooting during the winter. They had found the snow-shoeing too heavy, and were on their return to camp without having found any trace of the missing moose.

We obtained our first view of the lake the morning we left it, and were much impressed with its beauty. It is about twelve miles in circumference, with one island in the centre, containing about sixty superficial acres, and well timbered. A very extensive *brule* on the west shore rather mars the beauty of an otherwise lovely lake and surroundings. Some idea of the number of lakes in this region may be formed when I add that in two days we crossed thirteen, to say nothing of the many that surrounded us on both sides.

Our return to the first settlement was marked by no incident worthy of particular note, unless I except the snow-shoeing. I have never in my experience seen anything like it. At every step we sank knee deep. A mile at leading was as much as one could do, and so we went on for three weary days, glad when night came to put up our tent and rest our weary limbs. Our Indian on his last day out got *mal de raquet*, or snow-shoe sickness—a contraction of the sinews of the calf of the legs, brought on from the weight of the snow shoes loaded with snow. From Little Saguenay we were three days in completing our journey by sleigh. The roads were blockaded everywhere, and we were frequently three or four hours going a mile or two, having to get out and shovel out the road for the horse and sleigh with our snow-shoes. In one swamp late one night our horse got off the road a dozen times, and as often were we compelled to unharness him, upset the sleigh, and actually dig him out, and had the poor brute not been made of good stuff, and assisted himself, we would have lost him. We found it difficult to obtain anything fit to eat from the settlers. Hard times was the cry, and too stormy to get down to the settlements. A railroad is sadly needed to bring these poor people nearer a market for their produce, and I hope when I again visit this region I shall see them all prosperous, with a market at their doors in shape of a railroad, and strangers flocking in from all quarters when the country is more comatable.

G. M. FAIRCHILD, Jr.,

Valcartier, Canada East, March 31st, 1876.

For Forest and Stream.

THE GAME OF MANITOBA.

FOR the past three or four months I have purchased your valuable paper from the principal newsdealer in this out of the way place, and being myself a sportsman at heart, I have been very much interested in its contents. Such variety of subjects as well as the many incidental hints to sporting men it contains, must necessarily give it a charm in the eye of the lover of hunting.

Imagining, however, that your readers would like to know some facts regarding this part of the "Great Northwest," I venture to intrude on your valuable space with a brief description of the game, (and the facilities for hunting) with which this country abounds.

Winnipeg, the seat of Government, is a thriving town of five years growth, numbering some 6,000 inhabitants, and within three miles on any side of it, during the spring or fall, the hunter may fill his game bag with prairie chicken (pinnated grouse), partridge (ruffed do.), or the white hare, not omitting duck, plover, wavy, (a small species of goose, I don't know the proper name) gray geese, and many other water-fowl. The surrounding country is, on the west side of the Red River, level prairie, occasionally broken by small bluffs of poplar, and every here and there a swamp or muskey, all of which in the spring are covered with ducks. Following the course of the river to Lake Winnipeg, you come to one of the largest duck shooting grounds in the country, perhaps in the world, viz.: the mouth of Red River; the amount of water fowl is something wonderful. The Indians here never use more than ¼ oz. of shot, No. 2, but they slaughter the birds by creeping up to a flock in their canoes, and firing at a few yards. We have, however, here many residents, American, Canadian, and however, here, many residents, American, Canadian, and English, who are lovers of the gun and dog, and many a boat load of ducks and geese arrive in town, *not* slaughtered, but neatly killed, and in a sportman-like manner.

As yet we have no sign of spring, except a light southerly breeze, and the advent of crows yesterday, but I think the three feet of ice in the river is getting rotten and in a week or so we may hear the welcome sound of geese flying overhead in the early morning. In the fall of the year the prairies literally swarm with prairie chicken, and it is no uncommon feat for a fair shot to bag from sixty to 150 in one day. One settler whose farm is on the outskirts of the province, tells me that he never goes out systematically to shoot chicken, but kills them from the windows of his house; they feed in great numbers around the farm yard. Until this last session of our local Parliament there has been no law for the preservation of game, and in consequence, chicken and duck were killed indiscriminately every month of the year. To give some idea of the sport in shooting wavies. I may say that a friend of mine and his companion set out last spring for the Pembina Mountains, about seventy miles from here, where the birds have a favorite feeding place, as there is plenty of gravel. He assured me that in two days he and his friend bagged 250 wavies and left a number besides for the half breeds who were with them. Three or four carts were used to bring the game home. This statement may seem exaggerated, but I could, if necessary, give you names and date. For several years the existence of woodcock here has been a disputed point among our sportsmen; this doubt has, however, been satisfactorily removed by a gentlemen residing in this province, bringing in three brace which he killed while hunting west of the city.

Besides the birds I have mentioned, swans, cranes, gray and white pelicans, &c., are very plentiful in the lakes and marshes, with which the county abounds. The flesh of the gray crane is very fine and much esteemed, whereas I understand that in the States it is considered unfit for

food. There are here two species of white crane, one very large, and having a crimson patch on the top of the head, this bird is very showy, and if only winged, extremely dangerous to approach. I heard of a man who broke the wing of one, the crane charged him at once and stuck his beak into the barrel of the gun, (which was a 12 bore) the man immediately hoisted him and kept him there until strangled.

The yellow legged plover is also very plentiful here, and one can make a bag in almost any marsh or swamp; in the fall of the year they are very fat and a delicious addition to the larder. With respect to our larger game it consists chiefly of moose, elk, caribou, black and brown bear, and beaver, the latter in my opinion as much a delicacy as any of them. Moose, especially in the vicinity of Pembina Mountains and the region north of Shoal Lake are very numerous, as also in that portion of the country lying between here and the Lake of the Woods. One Indian, whom I know, having last winter killed sixteen in nine days with his single flint gun. Unlike their brethren in Nova Scotia and New Brunswick, the moose here do not "yard," but travel generally in pairs or at most four together. The hunting of them is very difficult and great hardship is endured by the hunter, being compelled to use very large snow-shoes, and then sinking to the knees at every step. The snow in this country having no crust at any time during the winter. Of course I speak of the wooded district; on the plains there is never any great depth of snow. G. M.

Winnipeg, Manitoba, Canada, April, 1876.

Fish Culture.

ABSTRACT OF THE ANNUAL REPORT OF THE CANADIAN COMMISSIONER OF FISHERIES.

We have before us the voluminous "blue book" which comprises the Annual Report of Mr. W. F. Whitcher, Dominion Commissioner of Fisheries, for the year 1875. From it we find that the total value of fish products in 1875 was $10,347,886, exclusive of the fisheries of British Columbia, Manitoba and the North-West Territories. The exports of fish and oils from these countries between 30th June, 1874, and 30th June, 1875, are given in the Trade Returns as amounting in value to $134,723. It may be estimated that the value of fish entering into domestic use in these two Provinces is more than double that amount, which would increase the total product to about $400,000. The product of the fisheries in 1875 was somewhat less in quantity than it was in 1874.

This difference is observable more particularly in the yield of the fishery for salmon and lobsters. The tables subjoined to the report show in detail the various kinds and quantities of fish caught in the several Provinces and also their values. It is so arranged as to admit of an easy comparison of each detail with similar details in the published returns for the previous year, in order that the increase and decrease in the quantity and value of the different kinds of fish may be readily understood. This detailed comparison enables us to understand that while there is some difference in the aggregate quantity and value of the produce of the fisheries last year, it is reasonably accounted for as a mere fluctuation rather than indication of failure, and that it is to a great extent compensated for by sectional advantages and a fair average of general success.

Notwithstanding this exceptional difference the condition is altogether satisfactory; the fishing population as a whole have enjoyed reasonable prosperity, and now that river and estuary nurseries have been established and improved, a yearly increasing yield from the fisheries is anticipated. But the report says:—

"It will be, however, necessary to guard with excessive and improper modes of fishing, which the competition of foreign fishermen along our shores is very likely to occasion. Already serious complaints have been received from the Bay of Fundy and elsewhere respecting the manner of conducting the herring and other fisheries by United States citizens admitted to Canadian waters under the treaty of Washington. Unless proper measures shall be adopted to restrain all parties from injurious methods of fishing, the Canadian fishermen may resort to similarly objectionable practices in self-defence."

The trade returns published by the Customs Department show that the fish exported through the customs in the fiscal year to 30th June, 1875, exceeded in value the exports of the preceding year by $88,159. In 1874 the exports amounted to $5,292,368, and the imports to $925,692. In 1875 the exports were valued at $5,380,527, and the imports to $830,129. The increase of exports during the six months following to 31st December, 1875, is in greater proportion, the whole amounting to $3,502,749; and the imports to $361,913.

Owing to the great destruction of young whitefish caused by summer seining with small meshed nets, the Fisheries Act prohibited seines during June and July. This prohibition was represented as bearing harshly on the fishermen of certain localities where seines alone are used and are serviceable only during the calm weather. After investigating the matter, and being satisfied that if the meshes of the seines are large enough, and the seiners are warned against killing or catching the fry the Commissioner suggests an amending regulation to allowing seining in summer time with nets of at least four inches extension measure in the meshes.

As an interesting item to anglers we note the fact that the total sum accruing as rents under leases of angling privileges is $4,685. The salmon caught by anglers with artificial flies numbered 2,780. It is impossible to state the whole expenditure in rents, outfit, expenses, etc., which they incurred; but it is probable that the outlay of private persons on the thirty-four rivers fished by these angling parties was about $37,200.

No efforts appear to have been lacking on the part of the Canadian authorities to bring about some common code of local regulations, and Mr. Whitcher prints a letter to Professor Baird on the subject of co operation, in which he pays a high compliment, not only to the U. S. Fish Commissioner, but to the different State Commissioners and the American Fish Culturists Association.

The Dominion Government has now in actual operation seven public establishments devoted to the artificial reproduction of fish. Besides those formerly existing at Newcastle, Gaspe, Restigouche and Miramichi, this department has built and completed three other handsome and commodious establishments at Sandwich, on the Detroit River; at Tadousac, on the Saguenay River and at Bedford, on the Sackville River, near the head of Bedford Basin, and only a few miles from Halifax. The capacity of the parent institution on Wilmot's Creek in Ontario, has also been enlarged, so that in future the interior can accomodate many millions more of fish spawn, and the rearing ponds will harbor millions of young fry. We have before printed descriptions of these hatching establishments, and it may not be out of place here to turn to the appendix and make a brief abstract from the report of Mr. Samuel Wilmot, under whose direction the fish hatching operations were conducted.

Mr. Wilmot, in 1867 and 1868, made the first successful attempt at rearing the *coregonous albus*, or whitefish, since when numerous American fish culturists have prosecuted the work with great success. The first lot of eggs were laid down at Sandwich the past year, on the 10th of November, and by the 16th, when the spawning season had ceased, all the prepared space in the building had been stricken with ova. Notwithstanding the many drawbacks arising from the use of steam power, the difficult work of erecting up machinery and other newly invented appliances in fish-culture, and the extreme difficulty in obtaining parent fish, it is probable, according to present appearances, that ten or twelve millions of young white fish will be ready for distribution. It is a fact worthy of notice that this large number of fish may be regarded as clear gain, as the ova thus preserved were taken from the fish when hauled on shore by the fishermen to be sold for home consumption or shipped to the United States during the winter months. Mr. Wilmot says:—

"Would it not then be wise that an effort should be made in the manner indicated to replenish the waters of Lake Ontario with both whitefish and salmon trout, the two principal commercial fishes in it? The fisheries at Hamilton, Toronto, Cobourg, Presqu'isle, Consecon and Bay of Quinte, once yielding unlimited supplies of whitefish, are now, comparatively speaking, almost depleted, and unless the means referred to be speedily adopted, or a system enforced for the thorough prevention of the destruction of these fish during the spawning season, this natural source of wealth in Lake Ontario must inevitably be lost."

At Newcastle, Ontario, over a million of vivified salmon eggs were deposited in a healthy state, together with 300,000 salmon trout eggs, and 200,000 whitefish eggs. About 70,000 salmon eggs were deposited at Gospe, which quantity ought to have been quadrupled but for the escape of the stock of parent salmon pruned up during the summer time. The Tadousac establishment, which turned out 80,000 of last winters batch, has this year about 200,000 salmon eggs in excellent condition. The number of salmon ova laid down at the Restigouche works was 300,000. At Miramachi only 60,000 were procured, the sudden advent of wintry weather having prevented the gathering of any considerable stock of spawn. The Bedford establishment has 600,000 salmon eggs in a thriving condition. This is an excellent beginning in Nova Scotia. The whole number of young fish distributed last spring from the hatching of 1874 was 1,700,000.

Nearly 30,000 salmon fry were deposited in different parts of Salmon River, about forty miles below Ottowa City, making 47,000 distributed in that stream. The guardians report that the upper waters were crowded with young salmon in the autumn months, and that many were seen exceeding ten inches in length. It should be proved exclusively next season whether or not these youngsters will emigrate to the salt-water and return, after the fashion of their kind, to the nursery waters in which they are reared though not bred. The natural instinct which leads salmon back to their native streams may possibly develope itself in a secondary manner among those artificially hatched and transferred to other waters, thus leading them as adults, back to localities where they have passed the earlier stages of their existence.

Great numbers of the Lake Ontario salmon having been artificially bred at Newcastle, and after furnishing fry to re-stock other streams, have every year escaped into the lake, the time has arrived for testing to what extent they may now be captured as adult fish, fit for food and commerce. That they are sufficiently numerous in the vicinity is plain, for large schools of them are frequently seen by the fishermen, and quite a large number are taken in the nets used outside for lake trout. There are difficulties in the way of capturing them as early in the season and in the same manner as salmon are caught in the tidal estuaries and on the sea coast. The main difficulty is their habit of approaching the lake shores, chiefly about spawning time, when they are less valuable for market, and at a time when the law interferes with their capture.

In addition to enforcing those sections of the Fisheries Act which relate to the obstruction and pollution of streams frequented by fish, the statute relating to sawdust and mill-offals in navigable streams was enforced wherever the urgency of abuses demanded legal interference.

The restrictions upon fishing in inland lakes have been so far relaxed as to admit of fishing under special laws during the fall and winter months, thus not only affording work for the men employed but furnishing a supply of cheap food for the poor and needy. The Commissioner suggests the propriety of extending this license to Lake Memphremagog and others were strictly preserved. A regulation has been passed prohibiting fishing for codfish with seines at a less distance than half a mile from any fishing ground where boats are anchored and fishermen actually engaged in fishing for cod fish with hook and line.

The complete exhaustion of oyster beds in some parts of the Dominion is commented upon by the Commissioner and he fears that unless dredging is prohibited for at least three years it may be too late to save enough to supply seed for cultivation. The lobster fishing is also on the decrease, ascribed to over production and wasteful capture of spawners and undersized lobsters.

The fears expressed two years ago have last year been severely confirmed. A falling off in the value of the lobster catch amounting to $546,950 in a single year is sufficiently alarming to arrest attention. There seems to be no other remedy but an absolute prohibition during the principal part of the spawning season.

The Commissioner suggests the thinning out of the salmon stands fished in Gospe Basin. In some districts within the Province of Quebec the salmon fishing has increased in yield since 1868 nearly three hundred per cent. the result of reducing the nets used in estuaries and rivers, and protecting the fish while breeding. This improvement is most noticeable in the Restigouche and Moisic districts.

The Commissioner speaks in flattering terms of the International Society for protecting fish and game. He says:—

"A strong movement has taken place in the United States, supported by men of energy and ability, to form an International Society to protect fish and game. The objects of this Association are most praiseworthy, and the practical and vigorous manner in which its members have commenced the work certifies to their earnestness and augurs success." Better local government laws, and the employment of forest rangers, or the aid of the staff of outside officers employed in the fisheries service suggested.

As the report occupies some three hundred pages our abstract is necessarily somewhat meagre, although we have covered the main points. Did our space permit we should desire to publish the sub-reports of Mr. Wilmot on fish culture. John Mowat, Fishing Officer of the Restigouche Division and others. However enough has been given to show the magnitude of the fishing interest of the Dominion, and the energetic manner in which they are being cultivated and protected.

SINGULAR DISASTER—MUSKRATS DESTROYING FISH WORKS.

Wenonah, Gloucester, Co., N. Y.

Editor Forest and Stream:—

I send herewith a slip from the Woodbury *Constitution*, one of our local papers:—

"The fish breeding works established by Mr. Peirce, at Wenonah, in this county, were completed last December and stocked with black bass. Three or four weeks ago some muskrats effected a lodgement in the bank by the bridge, and Mr. Peirce, aided by a sharp little rat-terrier, waged war upon their intrenchments, killing some and driving the others away as he supposed, but on Sunday night, the 23d inst., one made his presence known pretty effectually by going through the embankment, or enough of it to let off the waters of the lake, and adding very materially to the stock of black bass in Mantua Creek. Unfortunately, the bass were now upon their hatching beds and many thousands of valuable embryo fish are thus destroyed. The loss to Mr. Peirce is quite severe, not only in fish but in damage by water. Less than a year ago a muskrat made a hole through one of his dams holding a reservoir stocked with salmon-trout, by which he suffered quite a serious loss; and about a year and a half ago a freshet swept away a small reservoir containing a stock of brook-trout. He will certainly have the sympathy of the friends of fish culture, and of the community generally."

I send also some incidents in connection with this matter. First, I will state that it is some little consolation to know that I have a two hundred and fifty dollar muskrat skin. Our little English terrier "Joker," whose exploits in ecl catching you published some months ago, took the trail of this rat the morning after the disaster and following him to his retreat on the bank of the stream, dug nearly half a day when the rat slipped into the stream. Little Joker plunged in and caught him, getting severely bitten. He ran fully thirty yards with him to find a good dry place for the final struggle, which was "short, sharp, and decisive." While he was trailing down the stream in the morning, and a few yards ahead of me, he barked sharply, and as I approached plunged into a water hole as I supposed for the rat, but I was just in time to save a large bass, one of three only saved from my entire stock. The one found by the dog is a female, the other two being males. I have them now in a small reservoir, and the female hovers around the edges with her dorsal fin out of water. I am inclined to think searching for a spawning bed.

Among a lot of black bass which I obtained last November for the West Jersey Game Protective Society, (from vicinity of Harper's Ferry) was one three pound female, which acted strangely, and I kept her as one of my personal quota of the lot. In December I saw a foot or more of *gut* line hanging from her gills, and upon examination found a large hook far down her throat, but could not get it. Placing her in a fish can of water, I took her to a dentist who, with a long, slender pair of forceps extracted the hook. On the 1st day of June I placed her with the smaller bass in my bass pond, just now drawn off. Early in the morning, after the disaster, and while there was yet some water left, I discovered this large female making vigorous attempts to get to her spawning bed several feet distant from, and about two feet above water. She would swim about one-third out of water, then retreat and try some other channel pointing in same direction. Before I had things fully secured she escaped down the stream. Thinking these little incidents of interest to my co-laborers, I send them for publication.

Milton P. Peirce, Aquadale Ponds.

—Seventy-five thousand salmon trout were recently put into the head of Skaneateles Lake.

Restocking Connecticut Lakes.—A correspondent writing from Lakeville, Conn., with regard to the operations of the Salisbury Bird and Fish Protective Society, says:—

"This spring the subject of stocking our streams and lakes was agitated, and we have made arrangements with Mr. E. P. Pease of the Twin Lakes trout farm, (who is one of our most active members) to hatch 60,000 brook trout and 40,000 land-locked salmon for us the coming season, to be placed in our lakes and streams. Meantime we have succeeded, through the efforts of our President, Mr. Barton, and one of our counsel in securing and placing in two of our lakes, Washining and Wononscopomac, 20,000 young land-locked salmon. The fish were brought

here by Mr. Geo. Jelliffe, the Superintedent of the Westport Trout Association's hatching works, as pleasant and genial a gentleman as one often meets, and who seemed much pleased with our lakes and scenery. There has heretofore been only $5,000 appropriated for the Commissioners and Mr. Jelliffe says that violent opposition to any appropriation is expected from pound and net fishermen along the sound. It is to be sincerely hoped that the appropriation may be made, for certainly the taxpayers of this State, in no way, more fully get the worth of their money than in the increase of food fish through the efforts of our State Commissioners.

W. H. WILLIAMS.

HOW AND WHERE EELS GENERATE.

MACHIAS, Maine, April 22, 1876.

EDITOR FOREST AND STREAM:—

I noticle an article in June 17th, 1875, headed "Generation of Eels." Now I am no eclentist but would like to state "what I know about" eels. Until the past six years I always lived in the town of Machias, which is at the head of tide waters, belog some six or eight miles from the sea. The falls with the dam are so high that no fish were ever known to go up except salmon. In my boyhood days and to this day, hundreds of little eels about the size of a large darning needle can be seen swimming around tho wharves and along the shores and in little pools in the marshes that are covered at high water. I have also seen them in small freshwater brooks running into tide waters, and furthermore I have seen them in the river and streams above the dam. This is proof positive to me that they breed where these little ones are found; but the *modus operandi* I leave for wiser heads than mine to determine.

G. L.

Natural History.

[This Department is under the charge of a competent Naturalist, indorsed by the Smithsonian Institution, and will henceforth be made a special feature of this paper. All communications, notes, queries, remarks, and seasonal observations will receive careful attention.]

A LIBRARY OF NATURAL HISTORY.

We constantly receive inquiries as to the best and cheapest books on various branches of natural history. Several such are before us, and we propose to answer them all together. In the first place there is no one work covering all branches in this country, except Fenney's school "Manual of Zoology," (price, $2), which is only outlines. J. G. Wood's "Natural History" is the best cheap general work. It can be got for $4 a volume and upward. The back numbers of FOREST AND STREAM contain a large amount and variety of general natural history, as also do the nine volumes of *The American Naturalist*. For mammals we have:—

Quadrupeds of North America: *Audubon and Bachman*, $50 to $75.
Pacific Railroad Reports: *Prof. Baird*, Vol. VIII, $5.
Mammals of New York (in Reports on Natural History of the State): *De Kay*. Very difficult to obtain separately.
Quadrupeds of Illinois: *Kennicott*. Patent Office Reports, Agriculture, 1857-8. Out of print.
Bats of North America: *Allen* (50c.); and various lesser books.

Upon ornithology there are written:—

Birds of North America: *J. J. Audubon*. Octavo and quarto editions; rare, and costing about $100.
American Ornithology: *Alex. Wilson*. Several editions, the quarto of Bonaparte selling for $60 to $80, and the little one without plates for about $20.
Ornithology of New York: *De Kay*. Rare separately, and expensive.
Manual of Ornithology: *Nuttall*. Rare, and worth $30.
Pacific Railroad Reports: *Prof. Baird*, Vol. IX, $5.
Ornithology and Oology of New England: *Samuels*, $6. Good to identify Eastern birds by, $6.
Key to North American Birds: *Coues*. The best thing to identify by, $7.
Manual of Ornithology: *Coues*. A hand book of taxidermy and field work; similar to *Maynard's* "Naturalists' Guide." No descriptions. Price of Coues' book $2.50; of Maynard's $2.
Birds of the Northwest: *Coues*. Habits and Synonomy of Northwestern birds. Published by U. S. Geological Survey, and only on sale by chance at $3 to $5.
Ornithology of California: *Cooper*. Elegantly illustrated, $10.
History of North American Birds: *Baird, Brewer, and Ridgway*. The most comprehensive and best of all. Three volumes are issued at $10 (plain), and $20 (colored) n volume.
Innumerable Pamphlets and Local Lists.

The chief books upon reptiles and fishes are:—

Herpetology of North America: *Holbrook*. Rare. Price $50 to $80.
Smithsonian Catalogue of Serpents: *Baird* and *Girard*, $1.
Pacific Railroad Reports, Vols. X and XII, $5 each.
Reptiles of New York: *De Kay*.
Contributions to Natural History of North America: *Agassiz*, Vol. I (Turtles) $10.
Fishes of Massachusetts: *Storer*, $12.
Fishes of South Carolina: *Holbrook*, $25.
Pacific Railroad Reports, Vol. X and XII, $5 each.
Fishes of New York: *De Kay*.
Reports of the United States and various State Fish Commissions.
Writings of Agassiz, Girard, Putnam, Abbott, Cope, Gill, and others, and various works on fish culture and angling.

In entomology (insects) there are:—

Guide to the Study of Insects: *Packard*, $7.
Our Common Insects: *Packard*, $2.50.
American Entomology: *Say*. Various editions, $12 to $18.
Injurious Insects of Massachusetts: *Harris*, $3 to $8.
Illustrated and expensive works on the butterflies, moths, etc., by Edwards, Strecth, Strecker, and others; and numerous publications by the Smithsonian.

Books upon mollusks include:—

Invertebrates of Massachusetts: *Gould*, $4.
Shells of New York: *De Kay*.
American Marine Conchology: *Lyon*, $20 to $40.
Terrestrial Mollusks of the United States: *Binney*. $30.
Land and Fresh-water Shells: *Binney* and *Rand*, Smithsonian, $5.
American Journal of Conchology, $10 a volume.
European works, and numerous American pamphlets.

The lower invertebrates have been extensively written upon by Agassiz in his "Contributions," Alex. Agassiz in his "Seaside Studies in Natural History," and by Packard, Verrill, Hyatt, Smith, Leidy, Clark, Stimpson, and others, whose essays are scattered through various periodicals. It is impossible to keep pace with the advance of natural science without reading the papers which are continually being read before and published by scientific societies and institutions. The proceedings of the Boston Society of Natural History, the Academies of Science in New York, Philadelphia, and San Francisco, the Smithsonian Institute, and the Government Surveys, particularly Dr. Hayden's, are specially rich in these publications, and most of the papers are issued in pamphlet form by the authors, making them accessible separately. It is also an extremely useful thing to keep an orderly and indexed scrap-book—if you do not put too much faith in your clippings before you have verified them.

—Many rookeries or breeding colonies of rooks still exist in various parts of London.

ANIMALS OF CONNECTICUT.

Lyncus rufus. Bay lynx; wild cat. Not common. A few yet remain in the larger tracts of woods in the northern and western portions of this State, but are seldom seen except in the spriug, when they occasionally approach the farm houses in quest of young lambs.

Procyon lotor. Raccoon. Common in every part of the State, but especially in the northern and western parts.

Vulpes fulvus. Red fox. Common. This species has been steadily increasing in uumbers for the last three or four years. In the summer of 1868 a black fox (*V. fulvus* var. *argentatus*) was caught alive in the western part of New Haven county. The owner kept it alive for several weeks.

Mephitis varius. Skunk. Altogether too eommon!

Putorius lutreola. Mink. The trappers have nearly exterminated this beautiful auimal. A few yet remain. [Mink bred near Norwich in 1873.—ED.]

Mustela noveboracensis. Erminc. This speeies is sometimes taken here in winter in the traps set for miuk or skunks. It is probably a resident throughout the year, but is never common.

Mustela pusilla. Weasel. Common. This little fellow is more frequently found in the neighborhood of farm houses than in the unsettled districts.

Lutra canadensis. Otter; very rare. Ooc is occasionally taken in the vicinity of the Connecticut or Housatonic Rivers; seldom occurs elsewhere.

Arctomys monax. Woodchuck. Very abundant in some districts; but as this species is easily exterminated it is seldom found in the immediate vicinity of lar ge towns.

Lepus sylvaticus. Rabbits. Common.

Fiber zibethicus. Musquash; muskrat. Abundaot wherever it is not molested by trappers, especially in the salt marshes.

Sciurus carolinensis. Gray squirrel. Common in some localities. This handsome fellow would be frequently seen everywhere were he not held in such high esteem for the table.

Sciurus hudsonius. Red squirrel. Very common.

Tamias striatus. Chipmunk; striped squirrel; ground squirrel. Abundant in some localities, rare in others.

Pteromys volucella. Flying squirrel. Abundant; but little seen on account of its nocturnal habits. This curious squirrel prefers a woodpecker's hole for its retreat during the day, but will sometimes take possession of the nest of the red or gray squirrel. I am assured, however, that it does build a nest of its own.

Mus rattus. Black rat. Common in the cities and towns, especially in the vicinity of sewers, where it outnumbers the brown rat.

Mus decumanus. Brown rat; Norway rat. Very abundant in granaries and barns in the country. This rat is frequently taken along the banks of streams in the traps set for muskrats, and is the first to find its way into houses erected in thinly settled districts. It is common also in the cities, but seems to prefer the country.

Mus musculus. Common house mouse. Very numerous.

Hesperomys leucopus. White-footed mouse. Common where cedars are abundant, in which tree it especially delights to build its nest. The further list of mice, shrews, etc., I must leave incomplete at present.

Condylura cristata. Star-nosed mole. Not very common.

Scalops aquaticus. Common mole. Very abundaut, especially in the vicinity of gardens, where it finds an abundance of earth worms, of which it seems particularly fond.

Vespertilio subulatus. Brown bat. Very common.

Phoca vitulina. Seal. A winter visitaut only. Occasionally makes its appearance at different points along the sea coast, but is not at all regular.

ROBERT T. MORRIS.

BIRDS OF LOWER MICHIGAN.

BY A. B. COVERT, OF ANN ARBOR, MICH.

(*Continued from Page* 163.)

FAMILY FRINGILLIDÆ.

Pinicola enucleator. Pine grosbeak. A rare visitor from the north. It was common during the winter of 1874, and the spring of 1875.

Carpodacus purpureus. Purple finch. Common in migratioos, arriving in the spring about the 20th of April, and passing here, going south, in September.

Curvirostra leucoptera. White-crowned crossbill. Sometimes common in winter.

Curvirostra americana. Red crossbill. Very rare.

Chrysomitris tristis. Goldfinch; yellow-bird. Common and resident, breeding about July 5th.

Plectrophanes nivalis. Snow bunting; snowflake. An irregular winter visitor.

Plectrophanes lapponicus. Lapland longspur. A very rare winter visitor.

Passerculus savanna. Savanna sparrow. Not common. Chiefly a spring visitor, arriving about April 15th. I have never known it to breed here. It departs southward the last of September.

Poœcetes gramineus. Grass finch or bay-winged buuting. Very common, arriving by the 1st of April, breeding by May 1st, and rearing two broods in the seasou. It departs for the south about the middle of October.

Coturniculus passerinus. Yellow-winged sparrow. Very rare, a few arriving by the middle of April. I have never known the nest to have been taken in this locality, but the bird has been shot during the breeding season.

Melospiza palustris. Swamp sparrow. This sparrow is common in suitable localities, where it is first seen about April 1st. It breeds about the 1st of June, and departs southward by the last of September.

Melospiza melodia. Song sparrow. Very common, arriving from March 1st to 20th. It first breeds by the 20th of April, and rears two or three broods in the season. By the 15th of October all have gone southward.

Junco hyemalis. Snow-bird. Seen from September to May, breeding in the northern portion of the State.

Spizella monticola. Tree sparrow. Rare winter visitor.

Spizella socialis. Chipping sparrow. Common, arriving about the middle of March, breeding by May 20th, and rearing two broods in the season. All have gone south by the last of September.

Spizella pusilla. Field sparrow. Abundant, arriving April 1st. It breeds by May 20th, and departs southward in September.

Zonotrichia albicollis. White-throated sparrow. Common in migrations, arriving about May 1st. It remains ten days, and then passes on to the north to breed, returning in its southern migration in September.

Zonotrichia leucophrys. White-crowned sparrow. Common with the preceding. They sometimes remain and breed, one of their nests having been taken May 22d, 1871.

Chondestes grammacus. Lark finch. An accidental straggler from the west. One specimen was taken May 10th, in company with white-crowned sparrows.

Pyrgita domestica. English sparrow. This bird is becoming very abundant. It is resident, but they have made no nests as yet.

Passerella iliaca. Fox sparrow. Common during migrations, arriving here by May 10th, and passing quickly to the north. It reaches here in its fall migration about the last of September.

Goniaphea ludoviciana. Rose-breasted grosbeak. This beautiful bird is a very common summer visitor, arriving about May 10th. It breeds about June 10th, and departs southward in the middle of September.

Cyanospiza cyanea. Indigo-bird. Common, arriving about May 1st. Breeds about June 1st, and has gone south by the last of September.

Pipilo erythrophthalmus. Towhee bunting or chewink. A common summer visitor, arriving by March 20th. It breeds about May 15th, and rears two broods in the season. I think this bird sometimes remains all winter, as I have taken them in January, in a large swamp three miles south of this place, but it usually disappears by October 10th.

[*To be continued.*]

AT HOME WITH THE BIRDS.—There seems to be one ornithologist at least who is content to let the professors dig out classifications, and who loves to watch the birds at home. We refer to Thomas Gentry, Volume I of whose "Life Histories of Birds of Eastern Pennsylvania" has recently been published. For six years he has been closely observing, in the field and in his studio, examining hundreds of nests and dissecting hundreds of stomachs. Many well-known habits are purposely repeated, because of the value of iterated testimooy to uniformity or change in habits of birds. But very many facts are herein published for the first time, besides corroborations of important statements by Audubon and Wilsou, which had been lost sight of. This new information is embraced under the following heads, which may be suggestive to those who cannot get the book. 1. Descriptions of nests which show marked deviations from normal structures, and the probable causes of the variations. 2. Nidification, periods of, and whether performed by the male and female separately or conjointly. 3. Duration of nest building and ovipositiou, and whether the eggs are laid on successive or alternate days. 4. Age of the young on quitting the oest, and the further time which elapses before they are fitted for self-maiutenance. 5. Character of the sexes both before and after incubation, particularly the male. 6. Insects, seeds, and berries which constitute their bill of fare. Mr. Gentry's notes are copious, and his style pleasant. His eyes are open to all the little facts and curious peculiarities of his different subjects, and nothing is so trivial that he does not value it for some hidden significance. His comments upon the architecture of birds, and his minute lists of their fare, are especially new, valuable, and interesting. It is rare that a book with a so thoroughly out-of-doors odor comes to us, and we predict for it a cordial welcome. It is greatly to be regretted that the printing is very bad, and the proof-reading worse. The present volume contains 400 pages, ending with the grakles, and the author promises the remainder very soon. It is published and for sale by the author at 55 Sharpnack street, Germantown, Philadelphia, Pa. Price $2.

—The second week in April was very cold and stormy throughout Great Britain, with much snow. Many of the migratory birds had arrived, and they suffered greatly. The swallows and martins were so exhausted by cold and lack of food that they could hardly fly, and might have been killed by the dozen. Several were seen floating upon ponds in the morning at one place, which indicates that a great number must have succumbed to the inclemency of the weather. Gulls have been seen in great numbers many miles from the sea. Wall fruit and pear trees suffered much, and raspberries, and in some places potatoes, were completely cut up.

—The toad, almost universally despised and upbraided for his ugliness, is yet a useful, good-natured, quiet fellow, who recognizes his friends and those who are kind to him. Like the sparrow the toad has been considered a nuisance, and in some sections has been exterminated; but the exterminators have been only too glad afterwards to get him back by the expenditure of large sums of money. So useful are toads in gardens that they are sold in France by the dozen, for the purpose of stocking gardens to free them from many injurious insects. The toad lives almost entirely on winged insects, and never does harm to plants.

—In reference to a paragraph on "Man-eating Sharks," printed a few weeks ago, an account in *Land and Water* of an accident to a man on the Australian coast will be of interest. This man swam out into deep water where a shark seized him by the thigh, and tore him so much that, although rescued without loss of time, he died shortly after. The shark is said to have been about fifteen feet long, and tried to seize hold of the person who rescued the lad, although on horseback.

—The English journals have lately given accounts of several female dogs and cats having voluntarily taken to nursing broods of ducklings and young chickens which had been deserted by their mothers, or were orphans, and showing the greatest solicitude for their welfare.

—At a recent meeting of the London Zoological Society, H. E. Dresser exhibited a hybrid between the black and hazel grouse.

BIRD ARRIVALS ON THE HARLEM.

WEST FARMS, N. Y., April 8th, 1876.

EDITOR FOREST AND STREAM:—

I inclose a list of the arrivals of birds which I observed in this vicinity during the spring of 1875. Although across the Harlem River, this town is now included in the limits of New York city. My notes were as follows:— March 30th, Pewee (*Sayornis fuscus*); April 8th, swamp sparrow; April 19th, yellow red-poll (*Dendræca palmarum*), April 22d, house wren; April 25th, white-bellied swallow; April 27th, brown thrasher and chewink; April 30th, bara swallow; May 1st, yellow-rumped warbler; May 3d, whippoorwill; May 5th, solitary vireo; May 6th, least pewee, cat-bird and yellow warbler; May 7th, blue yellow-backed warbler, house wren, and redstart; May 9th, yellow-breasted chat; May 10th, woodthrush, blue-winged yellow warbler, chestnut sided warbler, chipping sparrow, Baltimore oriole, king-birds and chimney swallows; May 11th, hummiog bird; May 13th, green black-capped, black-poll, Blackburnian and Cape May warblers; May 14th, hooded warbler; May 15th, prairie warbler; May 16th, scarlet tanager; May 22d, bay-breasted and Tennessee warblers.

I have also observed here a mourning warbler (May 25th, 1872), a Connecticut warbler (September 14th, 1874), a Nashville warbler (May 13th, 1874), and a worm-eating warbler (May 14th, 1873).

WISTHROP G. STEVENS.

ANTELOPE IN MAINE.—M. A. Clark, Esq., of Danville Junction, Me., who has a fine private collection of animals, writes us under date of April 23d:—

"I have just received from the Colorado plains a pair of antelopes (male and female) two years old this spring, and they are as tame as a cosset lamb, and to my surprise the buck is in full horn, as I always supposed they dropped their horns in winter same as deer. I find by placing them beside my young deer of the same age, that the antelopes are a little the largest, but their legs are smaller and more delicate than those of the deer. I am also just in receipt of a tame beaver from Three Rivers, Province of Quebec, and it is a curious sight to see him taking his breakfast from a birch club."

RECENT ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDEN.—One young alligator, (*Alligator mississippiensis*). Presented by William Trimble, Jr., Philadelphia. One brown thrush, (*Harporhynchus rufus*). Presented by Jos. F. Vogels, Camden, N. J. One brown thrush, (*H. rufus*); one white-throated sparrow. (*Zonotrichia albicollis*). Presented by Louis Snyder, Philadelphia. One black iguana, (*Metopoceros cornutus.*) Purchased. Two pig-tail monkeys (*Macacus nemestrinus*). Purchased. Three macaque monkeys, (*M. cynomolgus*). Purchased. One rhesus monkey, (*M. erythræus*). Purchased. One entellus monkey, (*Semnopithecus entellus*). Purchased. One young alligator, (*Alligator mississippiensis*). Presented by Jas. W. M. Cardoza, Philadelphia. One black snake, (*Bascanion constrictor*). Presented by Peter Snyder, Centrebridge, Pa. One garter snake, (*Eutainia sirtalis*). Presented by Wm. T. Wiegand, Philadelphia. Three Canada geese, (*bernicla canadensis*). Presented by Amos R. Little, Philadelphia. Two gray squirrels, (*Sciurus cinereus*). Presented by Mrs. E. M. Wright, Philadelphia. Two brant geese, (*Bernicla brenta*); one Canada goose, (*B. canadensis*). Presented by D. R. Sandy, West Creek, Ocean Co., N. J.

RECENT ARRIVALS AT THE CENTENNIAL AQUARIA.—Five thousand gallons of sea water. Presented by the Camden and Atlantic Railroad. One spotted tortoise, (*Emys guttata*). Presented by Milton P. Peirce, Wenonah, N. J. Four grayhugs, (*Thymallis tricolor*), Michigan. Presented by J. M. Collection of water-breeding insects of New York. Presented by Sarah J. McBride, Mumford, N. Y. Five rock bass, (*Centrarchus æneus*). Two sun-fish, (*Pomotis vulgaris*). Three suckers, (*Catostomus communis*). One black sucker, (*C. nigricans*). One ——— (*Percopsis guttata*). Three yellow perch, (*Perca flavescens*). One roach, (*Leuciscus chrysoleucas*). Three cat-fish, (*Ameiurus catus*), habitat New York. Presented by W. M. Locke, Honeoye Falls, N. Y. One stand of Coste Hatching trays, and one hatching-box. Presented by Mrs. J. H. Slack, Bloomsbury, N. J. FRED MATHER, Superintendent.

RECENT ARRIVALS AT THE CENTRAL PARK MENAGERIE.—One long-tailed duck, (*Harelda glacialis*), captured in Hudson River. Presented by Master Lee Clark. One mink, (*Putorius vison*). Presented by Mr. L. Titus. One Carolina parrot, (*Conurus carolinensis*). Received in exchange. Four prairie wolves, (*Canis latrans*). Bred in the menagerie. W. A. CONKLIN, Director.

Sea and River Fishing.

FISH IN SEASON IN MAY.

Trout, *Salmo fontinalis*.
Salmon, *Salmo salar*.
Salmon Trout, *Salmo confinis*.
Shad, *Alosa*.
Land-locked Salmon, *Salmo Gloveri*.

For list of seasonable trout flies for May see our issue of April 27th.

FISH IN MARKET.—The supply of fish on the slabs during the past week has been unusually liberal, and prices correspondingly low. A large hunt of remarkably fine mackerel has been made just south of Sandy Hook, and the fish retail at from 10c. to 20c. each. Striped bass are worth 18c. per pound; smelts, 15c.; fresh Kennebec salmon, 35c.; California, do., 30c.; shad are in fair supply, Southern fish bringing 25c.; North Rivers, 40c., and Connecticut do. 50c. each; weakfish have appeared at the east end of Long Island, and sell for 12c. per pound; white perch, 15c.; Spanish mackerel, 50c.; green turtle, 20c.; terrapin, $12 per dozen; frost fish, 8c. per pound; halibut, 15c.; haddock, 8c.; kingfish, 25c.; codfish, 8c.; blackfish, 15c.; flounders, 10c.; porgies, 10c.; sea bass, 20c.; eels, 18c.; lobsters, 10c.; sheepshead, 35c.; scollops, $1 per gallon; soft clams 30c. to 60c. per 100; white fish, 18c. per pound; brook trout from Canada, 50c., Long Island do., $1; hard shell crabs, $3.50 per 100; soft do., $2 per dozen; pompano, 25c. per pound. The reduction in this last named delicious fish, from its usual price of $1, is the most marked feature in the market.

—Some striped bass of fair size have been taken near Kingsbridge. The fish find their way from the Hudson through Spuyten Duyvil Creek and Harlem River to Long Island Sound.

—Seth Green has been appointed a judge of oysters at the Centennial Exhibition.

BY LAKE AND RIVER: Francis Francis, Field Office, 346 Strand, London.

No title could be more suggestive or appropriate to the contents of the charming volume which has beguiled for us so many pleasant hours within the past twelve months. For years the essays and memorabilia of the veteran editor of the London *Field* have enriched the Angling Department of that valuable journal, to the exclusion of all but its favored readers; and therefore when the spirit moved him a little better than a year ago, to gather some of his life experiences and publish them in a book, we fain must bless the promptiug of the impulse. No author has told us half so much of what may be seeu and done in the streams of England and the lochs and burns of Scotland; and he does not impart, or attempt to impart this information by a stiff treatise or disquisition; he simply starts out with his rod and creel at the beginniug, and goes a-fishing! He travels from stream to stream, and from one preserve to another, rambling on over a long stretch of country—from Morpeth to the Cheviot Hills and to Solway Firth—chatting as he goes, sometimes to the reader and sometimes to himself, telling what he sees on the road, and what by the lake and river, just jotting down a few *marginal notes*, as it were, with hints and suggestions, and bits of advice. Nothing escapes his attention or comment, and we have only to follow him (as a gillie, if it pleases,) and give heed when he soliloquizes, to learn all that need be of the features of the country and the peculiarities of the people; how they talk and what they wear; of their ruins, legends, dialects, and pastimes; of the game to be found on the mountains and moors, and the fish that are found in the rivers; and the modes of capturing each and all of them. And most entertaining it is to listen! There is no need to question; all is told before the asking. The author is voluable and only stops between breaths to toss in a fly, or to refresh himself by a pull at the qualified water of the Dee or the Tweed, which he carries handy in his waist-coat pocket. All who care to know anything of the out-door attractions of the United Kingdom, and especially those who hope at any future time to test the quality of its heathers and streams, should obtain a copy of this book. The instruction it imparts is beyond estimate and indispensable.

One cannot but mark the elasticity of this old angler's step, and the vigor and exhilaration which the freedom of vacatiou and the pure mountain air seem to impart to both body and mind. His buoyancy seems to float in the air; he scarcely touches the sward under his feet. There is beauty and joy in all he sees and hears, and inspiration in the blue sky, the carols of the birds and the whisper of the winds. We catch something of his blithesomeness as we con over the parentheses between acts. Nothing seems to mar his enjoyment; neither bad luck nor stormy weather discourage him. The rivers may be too full, or may be clogged with drift and scum; misbaps may occur; the awkardness of his gillie may lose him a heavy fish, or some other angler may have precedence on a favorite water; he recks not, but passes on to other scenes, whistling as he goes, and pencilliug his memoranda in his diary. We cannot but envy the good fortune of the man who chances to be his companiou. In one instance, after several unfavorable days, and disappointed at last with the meagre result of ten wee trout that "might, with a penny piece or two, weigh three pounds;" we find him *en route* from Aberfoyle to Loch Chou, jaunting along the highway, with the past all forgotten, and absorbed by the beauties of the surrounding country.

"What a delicious bit of scenery it is!" he exclaims. "Lake upon lake, pool, brawling burn and waterfall, mountain and fell, rocks, ferns, heather, aftel cloud and waving wood,—it is just like fairy-land. One seems to want to lie down in the heather with a cigar and gaze on it all day without moving; to listen to the waterfall, and to skylark and mavis, curlew and grouse cock, and drink in all sorts of heavenly and earthly sounds and scenes in exquisite and healthy laziness, in perfect *abandon* to the bliss of complete rest of mind and body; to re-iustil into one's faculties some of that essence of nature which is gradually worn away in the daily friction of the world. Oh! ye toilers and moilers among meu—oh! ye paterfamilluses, whose wearying struggle it is to keep up with the world and the insane requirements of society, who race with bankruptcy and paralysis and get beaten on the post—don't take your families to the seaside, don't be cheated by hags and devoured by bugs, and humbugged by conventionality into the belief that you have enjoyed yourselves when you know you have been miserable and devoured of *ennui*, but if women *will* go there, send them, and come here yourselves for a season. So shall you have rest for your souls, and fortify yourselves with powers of endurance against the shocks of business and the agonies of Mrs. Grundy in the future."

Contentment and good temper, with a disposition to accept the adverse with the sweet, are requisites indispensable to the complete enjoyment of a summer's vacation and a full recuperation of weakened energies. He who grumbles at weather and mischances is not fit to be included in the brotherhood of sportsmeu.

Our veteran angler does not despise worm-fishing, which he maintains, "in very low and clear water requires a good deal of skill." He says:

"It is a kind of fishing I am rather fond of, rambling along amongst the hills from wee poolie to wee poolie, with miuie cascades and streams such as you might almost make with a good-sized ewer; keeping carefully out of sight, and casting the worm neatly into these spots, and pulling out the spotted yellow-jackets from every likely hole, and that to an extent astonishing to the uninitiated; wandering on, never tied to one place for more than a few minutes, calling on nature without notice, and finding her most charming when not adorned or interfered with by art. It is the *dolce far niente* of trout-fishing, for there is no bother about flies and tackle; a yard of gut—you can't lose it—and a couple of hooks is all your stock. There runs a little darkling stream under that hole in the overhanging bank or rock. You know that if you cast your worm neatly and properly into that stream, and guide it clear of those stones (just where the lady-fern and blechnum grow so luxuriantly almost in the stream,) you will catch a trout of half a pound or *less* to a dead certainty. Suppose you make a bungling cast—no matter—cast again; the only cast which is useless is that which does not permit him to see the worm, or which does permit him to see you. Barring these two contingencies, you may cast for a week; and the odds are a hundred to one that he takes your worm as soon as he sees it. And then the walking—save the brisk walk home with the heavy creel at night—what is it but a delightful lazy saunter from brae to brae, and cast to cast! Then, too, you lunch on a hard egg and a biscuit, as only a fisherman can, and after that lie down on your back in the heather, fern, or wild thyme, or all together, looking up at the ever-shifting canopy above; and you smoke your tobacco as though it were worth a guinea an ounce, while the laverock sings to you "Lirra la, lirra la, la, la, he hu, he hu," higher and higher, till you lose him in the clouds. The monotonous note of the cornerake, too, comes drowsily up from the lowlauds, and the bees hum a mid-day lullaby; the brooklet murmurs softly peace and fortgetfulness; the very "louping of the trouts" in the little ruby colored pool below the linn yonder makes itself heard through all, connecting itself in a wavering, indistinct and dreamy manner somehow with something you have in hand—you are fast forgetting what."

No doubt, the chief delight of angling is derived from its associations. We could not bring ourselves to a full day's work with the rod without eloying of the sport.

We wish we possessed the faculty of so epitomizing all the information which this delightful book contains, that we might present it to the reader within our limited space, or reflect it as by a camera obscura. We can say only, in brief, that the conditions that apply to angling in Great Britain are quite different from those of America. The streams are unlike, while the fish and the methods of fishing measurably differ. The expense of fishing, too, is very considerable, and the restrictions are not always pleasant, as the angler who fishes a preserve is constantly under the surveillance of the keeper, and exposed to his officious criticisms and attempted advice.

The burns, or mountain trout streams, rise and fall suddenly after a rain in the most perplexing manner. Though the best fishing is really afforded after a flush of rain, the water changes several times a day. It may be bright and low, red and roily by turns, according as the drainings sweep down from the hills; and the angler must provide himself liberally with an assortment of worms, flies, and minnows, to suit the conditions. Quick-sands often surprise the wader, who is moreover constantly perplexed by weirs and dams, refuse, scum, and sheep-washings. The weather is capricious, even in July, and showers are too frequent to be pleasant. Midges, we find, are just as troublesome there as here; but we discover no allusion to the festive mosquito. Venomous snakes are scarce, which is a comfort to the timid to know. The trout in many localities are small, averaging not more than seven to the pound.

In the salmon streams one finds a greater variety of fish than in America, a fact which may or may not add to the pleasure of his fishing, according to his temperament. There are pike, salmon, grilse, bull trout and brown trout, sea trout, bass, etc., and one is as liable to strike one of these as the other. We find, therefore, that the rod in general use is heavier than here; yet, while two-handed rods are much in vogue, the tackle and flies are of the finest description, and to take a good mess of fish is a creditable performance. The day after a flood the fish will hardly rise at all. Decidedly different patterns are required for different waters, both for salmon and trout. In chapters 9 and 13 will be found some valuable information in this respect. Wading, casting from the bank and from a boat is practised, according to the necessities of the case. Great use is made of worms and minnows, the latter both live and artificial. Mr. Francis says that when these are preserved by salting, they answer fully as well as when fresh, if not even better. They may be kept for weeks until they resemble dried caplins, but fill out almost as well as ever, when thoroughly wet. As anglers are often put to it concerning the obtaining and carrying of minnows, this information is worth noting upon.

A good deal of information relative to the dog and gun and the game of the country is scattered throughout this book, and when one has finished its perusal and closed the covers, he feels that the author has given him more than an equivalent for his money, and that he has learned as much about many other things as about those to be found beside "Lake and River."

—There was a fly-casting contest recently, in which four members of the Lake City, Minnesota, Sportsmans Club participated with the following score:—Geo. Lemley, 53 feet; Gen. Israel Garrard, 50 feet; Dr. D. C. Estes, 50 feet; Wm. Morris, 47 feet. The prize was a water-proof fishing jacket presented by W. H. Holabird, of Indiana. Out of fifty members of the club only four came to the scratch, which indicates that angling is below par among them, or that modesty has become epidemic in their ranks. Mr. Lemly, the victor, is one of the best fly casters known. At the next tournament the clubs throughout the State are to be invited for a split bamboo rod made by Dr. Estes.

—William H. James, the manufacturer, at 338 and 340 Kent Avenue, Brooklyn, has sent us some beautiful gold and nickel plated trolling spoons of the "kidney" pattern, which show great care and nice workmanship in their construction. Mr. James is also the inventor and manufacturer of the new improved patent revolving blue fish

squids, which he thinks are just what are needed for cavalli and redfish in Florida waters, as suggested by our correspondent "Al Fresco." We have not seen the squid, and cannot judge of it, but would advise sending one to Dr. C. J. Kenworthy, of Jacksonville, if the inventor is really convinced of its success.

LONG ISLAND.—*Sag Harbor, May 7th.*—The bunker fishing opens in this bay, Peconic, very successfully. Thousand are caught daily. One fishing party caught 100,000 in one day last week. The pounds are taking them in great numbers, but unfortunately these pounds, with which these shores are lined, catch up all the "good fish" besides, such as blue fish, weak fish, black fish and bass, and leave very little to be gleaned up by the rod and line.

J. MCLELLAN.

MASSACHUSETTS.—*New Bedford, May 5th,* '76.—During the past week the fishermen have been setting their "pounds, traps, etc.," and the plethora of spring fish is just beginning. At present they catch plenty of tautog, perch, flounders, tom cod, some mackerel and a few scup (porgies in New York), but a curious feature is that the traps in this vicinity are filled with dog fish, which have made their appearance unusually early on the shores. Some of the fishermen fear that the scups have "gone by" during the late cold weather. CONCHA.

NEW JERSEY—*Kinsey's Ashley House, Barnegat Inlet, May 5th.*—Flounders have been very plentiful for the past month, 50 per boat being not an unusual catch. Black fish—a few small ones have been taken from the stone piles. Weak fish have put in their appearance. Not taking the hook yet. Only the gillers are catching them. From the past winter being so mild old fishermen predict an early appearance of blue fish. For the benefit of your readers, who enjoy that sport, I send you the first catches for the past five years, 1875, May 31st, by E. W. Miller, of New York, 1 bluefish. 1874, May 28th, by Willie S. Kinsey, 71. 1873, May 18th, Noah D. Taylor and John C. Bailey, of Jersey City, 96 bluefish. 1872, May 20th, J. Mr Atwater & Co., Cranford, N. J., 3 barrels. 1871, May 26th, C. Parker, 48. Last year only one was caught on May 31st. On the day following as high as 70 per boat were taken. B.

PENNSYLVANIA.—*Harrisburg, May 8th.*—Shad catching has commenced in the lower Susquehanna, at Columbia and other points south, below the dam, where the finest specimens of fish are now being caught. Above the Columbia, so far as heard from, not a fish has yet been taken. One or two hauls were made, Saturday evening, two miles north of this city, but not a shad was to be seen. The fishermen here are of the opinion that the money expended on the fish-ways at the Columbia Dam, has all been thrown away and censure the fish Commissioners roundly for it.

Few brook trout, compared with other years, have been captured in the mountain streams within a radius of 50 miles from the city this season. AUDUBON.

VIRGINIA.—*Leesburg, May 3d.*—A few bass were taken with minnows on Goose Creek last Saturday by myself and friend, above and below the rapids, but none with fly. The largest weighed a pound and a half. We saw no signs of spawners or spawning. The river in places near the rocks is filled with little fry too small to scoop up.

T. W.

MOVEMENTS OF THE FISHING FLEET.—There have been 26 arrivals of the cod and halibut fleet the past week, 6 from the Banks and 20 from Georges. The receipts have been 560,000 pounds Georges cod, 64,000 pounds Georges halibut, and 450,000 Bank halibut. Sales of halibut at 4½ and 2½ for white and gray. Round fish, $1.75. The shore fleet have had a light catch. Sales of codfish at $1.75, and haddock for $1 per hundred weight. There is a demand for Western Bank kench cured fish at $5 per qtl., at which price 1,500 qtls. have been sold, and 5,000 more would be taken if the demand could be supplied. They are wanted for the Halifax market.—*Cape Ann Advertiser, May 5th.*

—The season is now at hand when the white perch, tempted by the warm sunshine and the temperate air, leaves his cold winter retreat in the deep water at the mouths of the numerous rivers and creeks on the Atlantic coast, and ascends the streams in search of suitable food, and to select appropriate places to spawn. No fish of its size affords the angler better sport, and but few are equal to it as an article of food. Like the shad, the white perch should be eaten within a few hours after it leaves the water, as it rapidly loses its delicate flavor, particularly in warm weather. During May and June all of the streams emptying into the Delaware on the Jersey side afford the angler very fair perch fishing.—*Germantown Telegraph, May 3d.*

PICKEREL FISHING IN CANADA.

EDITOR FOREST AND STREAM:—

Leaving London by the 6:30 A. M. train we reached Bothwell at 7:45, a small town about thirty miles west, which was once the centre of the oil region, but now fallen into decay, as the oil has long since ceased to flow. With a team we moved southward, taking with us the local Fishery Inspector and Mr. W. H. Effingham, (who is one of the licensed fishermen) as a guide. About two miles drive through the bush, we came to our first hauling place. Hitching our horses to the remains of an old oil derrick, we plunged through the snow drifts which in some places were more than eight feet deep. At length we reached the River Thames, at a point called Sturgeon Bar, and were just in time to see the men at work with both seines and dip-nets. The seines are about thirty yards in length and four feet wide with three-inch meshes, and require four or five men to work them. The river at this point is about fifty yards wide. The net is placed in the stern of a punt; one man takes the oar and pulls a trifle up stream, and when about ten yards from the shore the net is paid out and the punt then takes a downward direction, and reaches the strand about thirty yards from the base of operations; then the two men who are left in charge of the shore end of the net, (which is secured by two ropes of twenty yards in length) move downwards until they meet the other fellows who bring them their end of the net up. The haul now commences, the reward of all this hard work being two pickerel of two pounds each! This was the first attempt we witnessed.

Going up stream, we stopped to see the dip-nets at work. These nets are rather an original invention. The net itself is about ten feet square, and is bent on a hickory hoop, and suspended from a *horse* (not a four legged one) consisting of three two inch hickory poles in the shape of a triangle, to the center of which is fastened a heavy stone, and a rope which runs through a block fixed on the end of a stout pole which projects over the river bank about fifteen feet. The rope passes through another pully at the shore end of the pole, and so down to a windlass, which is worked by one man. In fishing, the net is lowered as deeply into the water as possible, and allowed to remain a few minutes; it is then wound up. We waited, and watched, for twenty minutes, and the performance was repeated five or six times, the catch amounting to three or four fish at each dip. When fish were caught, they were removed by a landing net and placed in a box kept in the river. When enough are caught they are packed in barrels, then shipped, principally to Buffalo and London, (Ontario).

We saw all that was possible at Sturgeon Bar, and were presented with six of the largest fish. We mounted the banks of the Thames, (here very steep) and drove to Cashmere, a mile up the river, where the principal fishing is done. We again saw the seine at work, this net much larger and deeper than that at the Bar. The fishermen complained of the poor luck of the past night, as the fish, they said, were not running. We persuaded them to try once more for our benefit and they kindly agreed to make the attempt. The net being placed in the punt, away they went for 100 yards or so from the mill-dam, which is the first dam on the Thames. They pulled out into the middle of the stream, which was running very fast, (hard work it was) paid out the net in the way before mentioned, and reached the bank fifty yards down; the two ends being brought together, the work of dragging in began. The result was a sight to delight their eyes and hearts, pickerel and mullet jumping about in dozens; even the old gentleman who owned the net quit cursing (a habit he has) for ten minutes, till the counting was over. The catch numbered 220, of from one to eight pounds each. This was well worth viewing and amply repaid us for our trouble. We returned to Bothwell, got on board the 11:55 express for London, reaching that city at 1:45 P. M. JAMES S. NIVEN, M. D.

BLACK BASS TACKLE.

102 NASSAU STREET, April 28th, 1876.

EDITOR FOREST AND STREAM:—

I noticed in your last number but one an article on fly rods for black bass. As I have fished for black bass with a fly rod for over twelve years, I would like to be heard on the subject. Thereof I have used for so long a time was made by Judson, and is an ordinary 9-ounce trout fly rod; ash butt, lancewood second joint and tips, and with the exception of a new tip now and then, is yet in good order. I have used the same rod for brook trout and have killed several thousands with it. The black bass were caught in different waters, including Greenwood and Canandaigua Lakes and the St. Lawrence River, and ran in weight from a few ounces to four and a half pounds. I have often killed two at a time, weighing together three pounds, and I think it has been well tested. Judging from this, I think nine ounces in weight plenty for such a rod, and I know a gentleman who has fished with a fly for bass in the St. Lawrence for about sixteen years (averaging two months each year there) and he thinks an eight-ounce bamboo heavy enough. The great trouble is in the maker of the fly. Most of the flies tied for black bass fishing are too heavy, and the hooks have too large a barb. It is impossible with a light rod to cast and fasten two or three of those flies; but such flies are not necessary, and I have found by experience that a fly tied a little lighter on a sprout hook, say No. 2, will cast better and hook the fish with more certainty. I fished in the St. Lawrence last summer, stopping at Clayton, and had fine sport and excellent quarters. I wonder that there are not more visitors there. The climate is very bracing, no fly of any kind, and plenty of fish, and I am told that later, in the proper season, there is good shooting near by. They have the most beautiful boats there I have ever seen, and very comfortable.

W. HOLBERTON.

The Kennel.

THE KENNEL REGISTER.

A very interesting feature of the late Springfield Bench Show was the presence there of our Kennel Register, and many sportsmen availed themselves of the opportunity of registering the pedigrees of their dogs on the spot. Our list comprises, since it was last published and for the week ending Tuesday, May 9th, the following high bred animals:—

SETTERS.

Mr. Chas. F. Bancroft's Gay and Bess.
Mr. Max Wenzel's Jack.
Mr. E. J. Robbins' Vic and Flirt.
Mr. A. Hart's Flaca.
Mr. W. H. Balcom's Peg and Trim.
Mr. Wm. Jarvis' Shamrock.
Mr. J. A. Lakin's Ned.
Mr. Obed Finch's Feathers.
Mr. H. B. Voudersmith's Don.
Mr. W. J. Conover's Floss.
Mr. E. H. Pomroy's Flash.
Mr. J. Dwight Francis' March.
Mr. D. F. Worden's Flora.
Mr. H. Bullard's Raphael.
Mr. W. H. Gibbon's Ben, Kate, Flora and Sakey.
Mr. E. H. Nicoll's Bang.

POINTERS.

Mr. F. S. Davenport's Don.
Mr. F. Howe, Jr.'s Rex.
Mr. F. Stevenson's Phil.
Mr. W. M. Williams' Quaker.
Mr. F. Schuchardt's Tom II and Fan.
Rev. H. C. Berg's Tell, Forte, Bean, Trim, and Bun.

COCKERS.

Mr. Charles Allen's Grip.

Mr. Ethan Allen has engaged spaces and numbers for his entire kennel of well-known setters, and in our next we shall doubtless print the names of many well-known Springfield dogs, whose owners, being members of the Rod and Gun Club, were too much engaged with their official duties to band them in at the time.

BREAKING PUPS.

WE are frequently applied to for information as how old a setter or pointer pup should be when taken in hand to be broken. For the benefit of those who are raising young dogs, with a view of breaking them, let us say that everything depends upon the physical condition of the pup. With a good, strong courageous pup we have generally commenced when they were four months old to teach them to follow, to get over or through fences, and to come in, and down charge when ordered, and to accustom them to the report of the gun; and in order that a pup should not be frightened at the report of the gun, great care should be taken not to fire a charge directly over him, but take him to the field with a few light loads, which should be fired, first two or three hundred yards away by a companion, and then, if he is not alarmed, keep approaching, and firing, and nine times out of ten all danger of making a pup gun shy is passed. It is an excellent plan to take a young pup to where trap shooting is going on, but keep him at a distance for a few shots, and then gradually approach the shooting, so that he can see the effect of the gun. We have frequently commenced shooting over pups in the early autumn, when they were only five or six months old, and by the end of the season, when they were seven or eight months old, had them right well broken. Great care, however, should be taken not to work a pup of that age too hard, as long, hard work would be calculated to make them slow dogs. If game is very plenty, such a pup may be safely worked a full day, for then the work is not hard, but if game is scarce, half a day's work is as much as a pup under a year old should be given. Some are so timid that but little progress can be made in breaking them before they are a year or even eighteen months old.

—The Chicago *Field* is in error in stating that the third prize in the large pointer class, at the late Springfield Bench Show, was awarded to Phil, Jr., over Mack. Phil is only a puppy, six months old, and was judged with the puppies, being beaten by Mr. Schuchards Ned by a score of 88 points to 86. The error of our contemporary probably arose from the fact of the judges' cards not indicating whether the corresponding dogs were puppies or not, and Macks' card being credited with only 85 points.

—At a meeting of the Philadelphia Sportsman's Club on May 3d, $200 was voted to be appropriated for the purchase of prizes, to be given for the best setter of any breed over one year old, and for the best pointer dog of any weight over one year, exhibited at the Centennial Bench Show, September 1st to 8th, 1876. The Philadelphia Sportsman's Club cordially invite all breeders of fine pointers and setters as well as other sporting dogs, to be present with their animals, as very many prizes will be offered by individuals independent of the Centennial Commissioner's awards, which number in themselves 300 and over.

DOG COLLARS.—There is no portion of the kennel equipment to which more attention should be paid than the dog's collars. An ill-fitting collar is as uncomfortable to a dog as a similar article of wearing apparel would be to a man. A great error is also made in placing the plate for the name near the buckle. This should be in the exact centre of the collar when it is buckled, the weight being thereby more evenly distributed. Messrs. Thomson & Son, No. 338 Broadway, in addition to their general sportsmen's outfits, make an excellent dog collar which we can recommend.

—Mr. J. W. Foster, of Leesburg, Va., writes us that his imported field trial bitch Kirby, is on a visit to Mr. Luther Adam's Rock.

ANOTHER BENCH SHOW.—In connection with the annual meeting of the New York State Sportsman's Association to be held at Geneseo on the 23d, 24th, and 25th, inst., will be held a Beuch Show of Dogs, Dr. N. Rowe acting as Superintendent. The prize list is as follows:—

CLASS 1.—Imported English setters or progeny of the same. For best dog over one year old, Association cup; for second best dog, diploma. For best bitch over one year old, Association's cup; for second best bitch, diploma. For best dog pup under one year, Association's cup; for second best dog pup, diploma. For best bitch pup under one year, Association's cup; for second best bitch pup, diploma.

CLASS 2.—Native English setters. Same as No 1.

CLASS 3.—Red, and red and white Irish setters, (native and imported). Same as No. 1.

CLASS 4.—Black and tan and black tan and white Gordons, (natives and imported. Same as No. 1.

CLASS 5.—Pointers. Over 50 lbs., same classes 1, 2, 3, and 4.

CLASS 6.—Pointers. Of 50 lbs. and under, same as classes 1, 2, 3, 4, and 5.

CLASS 7.—Cocker spaniels. For best dog, Association's cup; for second best, diploma. For best bitch, Association's cup; for second best, diploma.

CLASS 8.—Clumber spaniels. For best dog, Association's cup; for second best, diploma. For best bitch, Association's cup; for second best, diploma.

CLASS 9.—Irish water spaniels. For best dog, Association's cup; four second best, diploma. For best bitch, Association's cup; for second best, diploma.

CLASS 10.—Fox hounds. For best dog, Association's cup; for second best, diploma. For best bitch, Association's cup; for second best, diploma.

CLASS 11.—Stag hounds. For best dog, Association's cup; for second best, diploma. For best bitch, Association's cup; for second best, diploma.

CLASS 12.—Newfoundlands. For best dog. Association's cup; for second best, diploma. For best bitch, Association's cup; for second best, diploma.

CLASS 13.—Scotch terriers. For best dog, collar; for second best diploma.

CLASS 14.—Sky terriers. For best dog, collar; for second best, diploma.

CLASS 15.—Spitz dogs. For best dog, collar; for second best, diploma.

CLASS 16:—Shepherd dogs. For best dog, collar; for second best, diploma.

CHAMPION CLASS.

For the best setter dog or bitch of winners in class 1, 2, 3, and 4. The Chicago *Field* Champion Cup, valued at $75.00.

Entrance fee, $2. for each dog; certificates of entry and all particulars can be obtained by addressing Kidder, M. Scott, Esq., Corresponding Secretary, New York State Association for the Protection of Fish and Game, Geneseo, New York. All entries of dogs sent by express must be addressed N. Rowe, Superintendent of the Bench Show, Geneseo, N. Y. The circular says:—

"Inasmuch as a great many gentlemen have intimated their intention of visiting the show with the object of purchasing dogs, the opportunity for those who have dogs they wish to sell will be unsurpassed. On the last day of the show, after the premiums have been awarded, any dogs their owners may wish to sell, will be sold by auction."

THE CENTENNIAL BENCH SHOW.

PHILADELPHIA, May 4th, 1876.

EDITOR FOREST AND STREAM:—

As the entry books for dogs to be exhibited at the autumnal Bench Show, September 15th, do not close until July 1st, an estimate can be made of the number of finely-bred animals that will be displayed on that occasion. Already a great many owners of setters and pointers have registered their dogs, and quite a list of individual prizes have been offered independent of the awards that will be made by the Commission.

The individual premiums are as follows:—

The Philadelphia Sportsmen's Club vote $300 to be appropriated to the purchase of two pieces of silver, one for the best setter, of any breed, over one year old, and one for the best pointer.

Mr. John Krider donated a silver mounted whip for the best American bred setter dog over one year old.

Capt. A. H. Clay gives a gold whistle for the third best American bred setter over one year old.

Capt. Chas. E. Tucker offers a silver cup for the best Cocker spaniel.

Mr. F. Rous gives a silver cup for the best imported setter one year old, and a silver collar to the best dachshund.

Mr. C. S. Westcott donates a silver cup for the best pointer dog 50 lbs. or upwards.

The FOREST AND STREAM have offered $100 as a prize, but as yet have not mentioned for which class.

The Chicago *Field* give a silver cup for the best English or American bred dog or bitch over one year old.

Many other individual prizes, it is said, will be offered, some for the hound and terrier class, while the Centennial Commission have awarded the awards as follows to *respective* breeds: For dogs of two years and over; dogs of one year and under two; pups.

A sweepstakes award will be made for the best dog of any breed displayed by a foreign exhibitor.

A sweepstakes award will be made for the best home bred dog of any breed.

Awards will be made to *respective* breeds, for bitches of two years and over; bitches of one year and under two; bitch pups.

A sweepstakes award will be made for the best bitch of any breed displayed by a foreign exhibitor.

A sweepstakes award will be made for the best home bred bitch of any breed.

It will be so fixed that the judges will decide as to the merits of the dogs before entrance is allowed to the public, and the animals winning the several prizes can be seen at once as the champions.

Mr. Chas. Lincoln, of Detroit, has been appointed Superintendent of the Bench Show, and will soon be in Philadelphia to arrange the details of the exhibition, and from the able manner in which the Chicago show was conducted, under his supervision, he is looked upon as a valuable aid in the work to be done.

The Bureau of Agriculture looks to New York and the East for a long list of blue-blood entries, and it is already a foregone conclusion that many of the prizes will go to the sportsmen of your section of the country.

Blanks for entry, and all other information in regard to the Centennial Bench Show, can be had by applying to Capt. B. Landruth, Chief of Bureau of Agriculture, Centennial Grounds, Philadelphia City.

HOMO.

THE IRISH SETTER.

SAVANNAH, April 18th, 1876.

EDITOR FOREST AND STREAM:—

I would like to inquire about the Irish setter, being entirely in the dark about that superior animal, never having owned one. But I am much confused by seeing in your paper pictures representing the Irish setters belonging to Mr. Jarvis; also the brace owned by Mr. Saltus. They have tails well feathered, and evidently their bodies are also well coated with curly hair. Now, in the Chicago *Field* are the pictures of two dogs, claiming to be of superior breed of the same class of red Irish setters, the dog Elcho and the bitch Loo II, belonging to C. H. Turner and R. C. Sterling. Now, they are represented as having straight hair and very moderate feather on their tails. I am entirely at a loss as to which is the Simon pure article, and I would beg of their owners, or some other sportsman, to enlighten me on the subject. The color question is a subject on which there has been much dispute, ignoring the real points of quality, viz.: feather, whether there should be much or little. Now these pictures, representing the same dog in all its purity, (all I have to go by), are entirely different. How can both be the same species, as each is claimed? The rat, the mouse, the quail, the pigeons of different breeds, all have the same lines and points, so they can be told at once even by the most ignorant. Now for the pointer, see how firm and tapering the tail; should there be the least feather perceptible on it how quick he would be condemned as either a cur or of dropper origin. I do not question but what both are good, and all worthy of particular note, but I do think and believe that both can be the same strain, for I can hardly believe there are two distinctive strains of red Irish setters—one with a superabundance of feather, and the other with very little. MARTELLO.

[The pictures of Mr. Jarvis' dog Dick, and Mr. Saltus' dogs show just about the coat and feathering of thoroughbred Irish setters. But the pictures you allude to representing Elcho and Loo have not done their originals justice. We saw those dogs at the Chicago Bench Show, and, although they were not then quite as well coated and feathered as we expected to find them, yet they were much better than represented in the paper, and were certainly good specimens of high bred Irish setters. The fault was with the artist, not the dog.—ED]

MR. BURGES' BOOK.

MEMPHIS, Tenn., April 25th, 1876.

EDITOR FOREST AND STREAM:—

From "Slug Sing" town you published a critique in your last issue on Mr. Burges' book, which queerly enough is signed "Vindex," though it is far less a vindication than an impeachment, mainly alleging the book is not worth the price, although elegantly bound. In the book I have no interest in shekels; in Mr. Burges I have a grateful interest and have heard many plead the same indebtedness to him, founded purely on his having given to all ardent practical sportsmen a Vade Mecum, an invaluable book, terse, true, and pointed, "multum in parvo," and withal a thing of beauty. In my parlor it adorns my centre table, and were honorable field sports that were dear to Daniel Webster and Sir Walter Scott, as staunchly defended by their thousand votaries in person, as shown to be fair, delightful, and scientific in Mr. Burges' capital book, we should have fewer deerstore and be a more stalwart and fraternal power among ourselves. Briefly let us analyze the specks Vindex hath pecked at on this golden apple. Vindex "expected from what he had heard, Mr. Burges was *competent* to handle the subject properly, and it would be an exhaustive treatise, etc., but after reading it I found my mistake." Shorn of verbiage, Mr. Burges is incompetent, also warrants in title and price what he fails to give value for in information. Let Vindex have a chance to vindicate Mr. Burges, as he does in his own words further on: "He knows so much himself that he overlooks the necessity of going into details for the benefit of those less learned." "It may be said that *my* ignorance is deplorable." We cannot conscientiously combat the position he has fortified. Vindex thinks the work is not the "text book by which we may become well posted," and meets the himself by saying "the principal topics are largely borrowed from (standard) works that have long been extant, etc.," whereas Mr. Burges' main idea is to collate and group the highest authorities, the proven truths, and weave us a golden net-work of crystallized facts so patent and and "accessible to every sportsman in the land" that there shall be no room nor reason for error. In my esteem this is one of the several great virtues in the "American Kennel and Sporting Field;" it condenses and illumines, focalizes, and throws the spray of the headlight on the knotty points, and makes seniors of freshmen, unless they prefer to be perpetual ever-green sophomores. The main point of objection is that Vindex considers *only* thirty and one third pages on breaking *very* insufficient. *Mon ami*, more than half the dog's virtues as a feather-retriever are instinctive. And surely if thirty pages more of proper *quality* be put in his brain-pan he should know several, indeed, many refinements beyond the four cardinal points, stand, back, quarter, and retrieve. Hast ever read that gem of sporting literature, "Vindex," the "Dead Shot" by "Marksman?" Dost remember he thoroughly instructs us in breaking pointers, setters, spaniels, and retrievers, in nineteen small pages? Small only in *quantity*, signor. For my own part I have been amazed and dazed at the profuseness and iteration of some writers mentioned as models by "Vindex," notably by Mayhew's formulas, "or this, or this," all different until the wearied mind joins with the ever-effeminated lover who cries

"How happy I could be with either,
Were the other dear charmer away."

Now for the *creme de la creme* of Vindex's exordium—"the high-sounding title and corresponding price, and name of the author are apt to deceive those who are obliged to order it unseen, into a wrong estimate of its real practical value as they did Vindex."

Mr. Burges is abundantly vindexed from the above aspersion by the fact patent to all posted sportsmen, the body of his book was serially published ere the volume was bound, giving notice to all of its excellent and standard embodiment, a manual, an ornament, and an annual gem.

GUIDO.

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

SUBSCRIBER.—Thirty yards and No. 8 shot with both barrels is not a correct test. Try one barrel with 1¼ oz. No. 6 shot at 30 yards; count the hits and forward as the result. Your gun is probably not choke-bored.

H. R., Philadelphia.—I have a setter dog, he has rough hair from winter coat, is there any medicine to remove it and give fine coat? How will I act? Ans. Give your dog balls of tar size of a hickory nut, twice a day for three days.

C. N. T., Stratford, Conn.—Female fishes are generally the largest. In the animal kingdom, the reverse is the case as you state. There is very little difference in the quality of the flesh and flavor of shad at the earlier part of the run; the females deteriorate later on.

S. J., Philadelphia.—1. Will it improve the shooting of my 10-bore Remington to use the "Kay" cartridge? 2. The gun is much smaller at the muzzle than it is six inches towards the breech; would it injure the muzzle to use the "Kay" cartridge? Ans. 1. Yes. 2. No.

THYMALUS.—When do grayling spawn? Ans. Grayling do not spawn until after the middle of April, and are therefore not in season before the middle of June. From the latter period they increase rapidly in flesh and flavor, and in September and October reach their greatest perfection.

R., Boston.—A friend of mine has a pug pup only seven weeks old, which passes and vomits long worms. What shall I do for him? I think you prescribe areca nut, but how can I get it, and what would be the dose for so little a thing? Ans. We have sent to you some areca nut, with directions for giving it.

BIERBOWER, Harrisburg.—1. What advantage is there between a gun put together with soft solder or one with hard solder, or is there any? 2. What is the reputation of Rankin & Bros., makers? Ans. English guns are put together with soft solder, which is much the most lasting. German guns are brazed, or hard soldered. 2. We do not know these makers.

WM. WEIR, Thompson, Ga.—1. Why is Audubon's "Birds of America" not republished with chromo lithograph plates? 2. Are Audubon's sons living? 3. Are there central fire, non-corosive gun caps? 4. Is a 12 or 14 gauge gun of like length and weight (8½ pounds) the most effective in range and power? Ans. No publisher will undertake the expense. 2. No. 3. Yes. 4. No difference.

HEADLIGHT, St. Louis.—Will you please let me know where I can obtain pads for testing penetrations? I have a 10-bore, 6½ lbs., 30-inch barrel, what would be considered good penetration at 40 yards with 4 drachms powder, 1¼ oz. shot? Ans. Penetration pads cannot be obtained here ready prepared. The best substitute is stiff hardware paper; of this 30 sheets would be good penetration.

G. E., Jr., Pokeepsie.—I have a black spaniel dog 15 months old that is very afraid of a gun, will you please tell me if he can be broken of this or not? Ans. Everything depends upon the cause of his fear of the gun, and his temperament. If he is naturally timid of other thing as well as the gun, it would not pay to break him, if it could be done at all. But if he is only shy of the gun, pursue the course recommended in our Kennel Column of this week.

C. S. J., Cambridge, Mass.—My setter dog, some six weeks since, had a very large abscess on his fore shoulder, and ever since the sore healed, the dog's nose has been in a dry and cracked condition; but within a week I have noticed warts coming inside his mouth and on the tongue, and now there must be some ten or fifteen in all. What do you advise? Ans. Warts in a dog's mouth is a new thing to us, and we do not know of a remedy. Give your dog 1 oz. castor oil, plenty of exercise and access to grass.

GUNNER, Peacedale, R. I.—If the dog and bitch are thorough-bred you may get good pups from them, but we much prefer breeding from broken dogs. Have sent you some areca nut by mail. You would find much better shooting there in October or November. It would be impossible to estimate the cost of such a trip as you contemplate. You ask if $100 would answer. That depends upon how many the party consists of and the character of the out-fit. The Parker gun is good and well worth the price.

L. H. P., Clarksville, Tenn.—I have a valuable pointer, which of late become very drowsy and inactive, occasionally vomiting. I have been told that he has worms, and think it probable, though have seen no signs of them; have been advised to give sulphur, but do not wish to try any experiment on my dog. Any advice you will be so kind as to give me will be most gratefully received. Ans. Your pointer is in all probability afflicted with worms, and we have mailed to you the proper doses of areca nut with directions for its use.

D. H. M., Boston.—I have a Gordon setter puppy four months old. He seems to be perfectly healthy in every respect, but his fore legs are sprung. He is, in fact, what is commonly called bow-legged, the knee joints protruding so that they form hunches the size of a walnut, making him look exceedingly comical and all out of shape. I am also of the opinion that the joints are weak. Ans. It is by no means an uncommon thing for puppies to be affected as is yours. And with proper food and care they often outgrow it. They should not be kept tied up all.

WILD CHARLEY, New York.—1. Will you please tell me which is the best place for hunting and camping, Hoy's Wilderness or the Adirondack Mountains. How much does it cost to go to Hoy's Wilderness, and when is the best time to go? 2. Can you tell me what will cure the mange on spitz dogs? Ans. 1. Hoy's Wilderness would be the cheapest. For further particulars see our issues of March 2d and 9th. 2. Use compound sulphur ointment softened with spirits of turpentine, so as to be well rubbed into the skin; wash the parts affected occasionally with Castile soap; feed no meat.

S. L. C., Augusta, Me.—Please oblige me with the names of books concerning Florida which will give me a good idea of the climate and best localities for sporting. I have read your "Camp Life in Florida" and like it much. I think there is something published at Jacksonville and like it much. I think there is something published at Jacksonville that will give me the most gratefully received. Ans. Your pointer is in all probability afflicted with worms, and we have mailed to you the proper doses of areca nut with directions for its use.

D. H. M., Boston.—I have a Gordon setter puppy four months old. He seems to be perfectly healthy in every respect, but his fore legs are sprung. He is, in fact, what is commonly called bow-legged, the knee joints protruding so that they form hunches the size of a walnut, making him look exceedingly comical and all out of shape. I am also of the opinion that the joints are weak. Ans. It is by no means an uncommon thing for puppies to be affected as is yours. And with proper food and care they often outgrow it. They should not be kept tied up all.

WILD CHARLEY, New York.—1. Will you please tell me which is the best place for hunting and camping, Hoy's Wilderness or the Adirondack Mountains. How much does it cost to go to Hoy's Wilderness, and when is the best time to go? 2. Can you tell me what will cure the mange on spitz dogs? Ans. 1. Hoy's Wilderness would be the cheapest. For further particulars see our issues of March 2d and 9th. 2. Use compound sulphur ointment softened with spirits of turpentine, so as to be well rubbed into the skin; wash the parts affected occasionally with Castile soap; feed no meat.

S. L. C., Augusta, Me.—Please oblige me with the names of books concerning Florida which will give me a good idea of the climate and best localities for sporting. I have read your "Camp Life in Florida" and like it much. I think there is something published at Jacksonville that will give me the information. Ans. To Florida for the Winter, by S. Fleet Speir; Florida, by Sidney Lanier, Lippincott, Phila.; and Bertram's Florida. For local publications address Columbus Drew, Jacksonville, Fla., who makes a specialty of these works.

W. P. S., San Francisco.—What is the best kind of hounds for hunting deer by scent? I would like to know if bloodhounds would not be better than fox hounds; also where in the United States good hounds of the two breeds I have mentioned can be obtained? Ans. From the description of your hound we would take him to be a deer or fox hound, and we consider the full breed fox hound or harrier the best for deer hunting in this country. Yet a cross of bloodhound with the deer or fox hound may be found to answer a good purpose, although we have never met with such a cross. We do not know where bloodhounds are to be obtained. Can select for you one or two couples of thoroughbred fox hounds.

G. A. F., West Meriden, Conn.—An old sportsman says the true way to preserve a gun from rusting, is after using the same to leave it foul till wanted, and then clean for use; that the burnt powder left in a gun after using is a better preventive against rust than anything that can be used. Will you please give me your opinion? If the rule applies to a shot gun, does it also apply to a rifle? If not a good thing to do, what is the best preventive against rust now known? Ans. We hold that to leave a gun dirty after using it is not only a most careless and unsportsmanlike proceeding but no preventive whatever against rust. Clean your gun thoroughly and then oil, inside and out with good sewing machine or Belmontyle oil, the latter evaporates leaving a film over the metal which will exclude rust.

SPORT, Ottawa.—1. I have a fine deer hound pup 1 month old, would you please tell me what kind of food to give it, also, should I keep him out of the house, or would it do him any harm to let him sleep inside, as the nights are still chilly? Would it spoil him on deer hunting to learn him to retrieve? 2. What would a pointer pup that you could send me cost, also could it be conveyed safely from New York here? 3. Is there a book teaching how to break in sporting dogs? If there is please state price? Ans. 1. Feed bread and milk or oat meal porridge and milk, keep him in a comfortable clean place. We do not think it would spoil him to break him to retrieve, but we never knew a hound to be thus broken. 2. A pointer pup could be safely sent to you; price $25. 3. "Dinks, Mayhew, and Hutchinson," is such a book as you need, price $3—can send you a copy.

GROVER, Springfield, Ill.—What are the trade distinctions of the various kinds of mackerel, which enters so largely into the trade? Ans. The New York and Boston wholesale trade are governed by the following classifications: No. 1 mackerel should not be less than 13 inches in length from the extremity of the head to the fork of the tail, fat, free from rust, taint, or damage; No. 2 11 inches in length; No. 3 10 inches; No. 3 13 inches, and in quality are those that remain after the selections of No. 1; No. 4 comprises all not in the above, and should be free from taint or damage. Mackerel should be kept covered with brine, and not exposed to the air, as it becomes rancid or "rusty" in a few days. Mess mackerel—the finest fish with head and tails removed. Extra No. ones are selected fish. Large No. twos—fish over 13 inches in length, and not good enough in quality for No. ones.

J. G., West Lehmon.—1. Can you tell me of some place where a party of ladies and gentlemen can camp out, and find good fishing and bird hunting (the latter in particular) in September? 2. I have found some insects resembling sheep tick on my setter pup; what shall I do to get rid of them? 3. A friend of mine wants a dog that will tree birds and squirrels. What kind would be best; where can one be procured, and what would be the cost of one four or five months old? Ans. 1. There are many places in your State where you could camp out and have good fishing. But shooting in September is too early. In October you could find woodcock and ruffed grouse. 2. Any kind of grease with a little carbolic acid added, well rubbed in the hair, will exterminate the insects from your setter pup. 3. A spaniel or terrier would be best for your purpose, and would cost $15 or $20; can get one for you.

MORDAUNT.—In recent number of your paper you speak of "a fishing otter" being sent to the Centennial Exhibition by a Mr. Morris, of Lake City, Minnesota. What is it? Is it alive and trained to catch fish? Ans. It is an old English device for trolling with flies or minnows, and consists of a board about two feet long and one wide, shaped like a sled runner, the lower edge being loaded with lead so as to sink within two or three inches of the top. Long lines are attached to it amidships and astern, which are managed by the angler who walks along the shore. The machine acts on the principle of the swing ferry which is worked by the current. The flies or minnows are attached to the board by short lines. In England they can be found at the tackle dealers, but are not in request here. The one sent to Philadelphia by Mr. Morris was handsomely acknowledged by Profs. Henry and Baird

N. V. K., Savannah, Ga.—1. I have a skye terrier bitch about two years old. About four months ago she was attacked with mange, hair falling out and sores in various places on her body, and to cure which I gave her Fowler's solution of arsenic, but used no ointment on her body, as she had pups at the time, and I knew of none, except such as contained mercury in some form or other. 2. Will you also tell me what a good thoroughbred dog would cost, about three or four months old or younger, that I could train as a retriever, and what would be the best breed to have? 3. Can you tell me of a good book on training and rearing dogs, not only hunting dogs, but terriers, etc.? Ans. 1. Anoint the parts affected with compound sulphur ointment softened with spirits of turpentine, so as to be well rubbed into the skin. 2. Address J. H. Whitman, Chicago, who has a fine strain of Irish water spaniels. 3. Dinks, Mayhew & Hutchinson is the best book for your purpose; we can send you a copy; price, $3.

SCHNAPP SCHOTT, New Orleans.—1. I am in possession of a centre-fire breech-loader, 12 bore, 32-inch, 7½ pound S. R. Cooper gun, moderately thick at muzzle and ¼ inch thick at breech; cost $50, and is as good as new. I contemplate having same choke-bored. What would you advise? 2. Does choking destroy interior finish of barrels or weaken same? 3. A friend possesses a $175 Scott, same characteristic of my Cooper, but of much superior finish, he wishes his choke-bored; would you so advise? 4. A gunsmith, of some repute here, says he has never seen a barrel too thin to be choked; is his theory correct? 5th Would any ordinary smith be capable of choking a gun properly? 6. How much should be bored off for a modified and for a full choke? 7. Does J. R. Cooper, whose advertisement I have never seen, rank a good maker? Ans. 1. We could only advise upon knowing the pattern made by at present. 2. No; except inasmuch as it makes certain portions thinner. 3. Same answer as in query number one. 4. Not as regards some modes of choke-boring. On the Scott principle, for instance, the reboring is all done for a certain space near the muzzle; in others it commences at the breech, and is gradual to the muzzle. 5 No. 6. We cannot tell; ask an experienced gunsmith. 7. Yes; first class.

HAND BOOK FOR YOUNG SPORTSMEN. By Will Wildwood: printed by the Sentinel Company, Milwaukee, Wis.

Our friend Fred Pond, Esq., of Montello, Wisconsin, who is enthusiastic in all matters relating to sport and the preservation of game, and is doing much good to the cause in various ways, has sent us a copy of a little volume with the above title. The works contains a good deal of really valuable information pertaining to sports by land and water, and so far as it goes supplies a much needed want. It is, in its inception, the germ of a larger future growth, which some person (perhaps the author himself,) may supply in days to come. We cannot say more of it, and we do not think its author claims anything more for it.

One criticism, however, it is our duty to make.

Upon page 27 the author endeavors to impress upon his readers the importance of learning the world-wide scientific name and only proper name of the game they shoot. This is extremely desirable, as he argues, but his methods are unfortunate. He has copied from Forester a list of the game of the United States, its classification and nomenclature, which, he says may be implicitly relied on in every particular. He then continues, that he is well aware that ornithologists of the present day have adopted a different code of names, but this he disregards, for fear that an "attempt to select from each would be but to create confusion." But he is not asked to select from each. Since the time of Audubon and DeKay—who were Forester's teachers—scientific ornithology has made great progress here and in Europe. The Smithsonian Institution recognized one stage of this progress in the "Check List," which was published in 1859, and another stage in adopting Lilljeborg's classification for its collections; and Dr. Coues has summed up recent advances in his late "Check-List," which may be bought for 75 cents, and gives the proper names, common and scientific, of every American bird. Another guide is the pages of this journal. The changes in nomenclature are not matters of taste but propriety. We cannot say of all the names in this book, that they are wrong; but all are antiquated. And the less the reader pays attention in what is in Italics the better. It is the unfortunate part of the volume.

FOREST AND STREAM

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCULCATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,

[POST OFFICE BOX 2832.]

123 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty-five per cent. allowed for five copies and upwards.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent.; over six months, 30 per cent.

NEW YORK, THURSDAY, MAY 11, 1876.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Editor.

WILLIAM C. HARRIS, Business Manager.

CALENDAR OF EVENTS FOR THE COMING WEEK.

THURSDAY, May 11th.—Racing: Lexington, Ky., Austin, Texas. Trotting: Woodbury, N. J., Washington, D. C. Bench Show of Dogs: Lexington, Ky. Base-ball: Philadelphia vs. Campbell, at Philadelphia; Athletic vs. Mutual, at Brooklyn; Cricket vs. Carbondale, at Carbondale, Pa; Live Oak vs. Rhode Island, at Providence; Fall River vs. Suffolk, at Boston, Mass.; Boston vs. Harvard, at Boston; Chicago vs. Cincinnati, at Chicago; Louisville vs. St. Louis, at St. Louis.

FRIDAY, May 12th.—Racing: Lexington, Ky., Austin, Texas. Trotting: Washington, D. C. Meeting of Kentucky State Sportsmen's Association, Lexington, Ky. Base ball: Athletic vs. Hartford, at Hartford; Philadelphia vs. Centennial, at Philadelphia, New Haven vs. Live Oak; at New Haven; Alaska vs. Chatham, at Hoboken, N. J.; Lowell vs. Fall River, at Lowell, Mass.; Cricket vs. Wilkesbarre, at Wilkesbarre, Pennsylvania.

SATURDAY, May 13th—Racing: Lexington, K. Austin, Texas. Rifle, *Turf, Field and Farm* badge and Hepburn trophy, at Creedmoor. Base-ball: Boston vs. Athletic, at Boston; Chicago vs. Louisville, at Chicago; Cincinnati vs. St. Louis, at St. Louis; Harvard vs. Brown, at Boston; Philadelphia vs. Active, at Reading, Pa.; Live Oak vs. Fall River, at Lynn, Mass.; Hoboken vs. Stevens' Institute, at Hoboken, N. J.

MONDAY, May 15th.—Racing: Louisville, Ky. Centennial Billiard Tournament begins at Philadelphia, continuing two weeks. Columbia Rifle Association matches at Guttenburg, N. J. Base ball: Athletic vs. Boston, at Boston; Philadelphia vs. New Haven at Philadelphia.

TUESDAY, May 16th.—Racing: Lexington, Ky. Trotting: Suffolk Park, Philadelphia; Spring meeting American Rifle Association, Pelhamville. United Schuetzen Association, Greenville, N. J. Base-ball: Athletic vs. Hartford, at Hartford.

WEDNESDAY, May 17th.—Racing: Lexington, Ky., Washington, D. C. Trotting: Suffolk Park, Philadelphia. Spring Meeting American Rifle Association, Pelhamville.

THE ADIRONDACKS.—Just as we go to press a dispatch from our correspondent Romeyn, dated Keeseville, N. Y., reaches us *via* Whiteball, and announces "open water from Marten's to Bartlett's, on the Saranac lakes." This will be pleasant news to early Adirondack visitors, indicative of possible trout fishing, and the cream of the sport.

—Visitors to the Centennial exposition are to be registered by telegraph. By an ingenious contrivance every one of the eighty turnstiles set at the several entrances of the grounds will be connected by wire with a dial in the main office. When a person enters through a turnstile he is instantaneously registered on this dial.

—Although English snipe continue comparatively plentiful on the New Jersey meadows, the close season commenced on the 1st. A fair quantity of doewitch snipe and yellow legs have been killed near Rockaway.

THE MINK.

THE establishing of minkeries by securing the wild animals and keeping them in close yards has enabled the naturalist to ascertain facts regarding their breeding and habits which were before unknown. This branch of industry is not only remunerative, but has contributed much to the knowledge of the student of nature.

The mink resembles the ferret in general shape. It has a long and slender body, long neck, and short and stout legs. The palmer surface of the feet are covered with hair, even to the nails. The feet are slightly webbed, which adapts them to water as well as land. The hair on the tail is inclined to stand erect, which gives it a round appearance. When excited it emits a strong musky odor, which is secreted in glands situated on either side of the tail. Its fur is very valuable for articles for ladies wear. The foundation next the skin is composed of a downy fur with longer and stronger hairs penetrating through it, which contribute in tinting the coloring of the fur and conceals the downy fur beneath. The under coating is of a brownish yellow, the outer coating is of an uniform tawny brown, excepting the ears and the sides of the under-jaws, which are a little lighter. The under surface of the tail and the posterior portions of the back are of a little darker tint. There is some white about the jaws and throat extending on the breast between the fore-legs. In different specimens the stripe of white is wider than in others.

There is quite a variation in the tint of minks. Some are much darker than others. The Canadian minks are darker than those in the United States, and the white on the throat is less distinct. In the southern part of the United States they are larger, with more white on the under-surface, with coarser hair, which is lighter in color; tail longer and less bushy. Among the mountain streams of the Northern and Middle States there is a smaller variety which is darker in color. The mink measures in length from eleven to thirteen inches. The tail varies in length from seven to eight inches. It is one of the most destructive depredators among the poultry yard. A single specimen will, if not discovered, cause the stock of poultry in the farm yard to disappear. Audubon says, "A fowl may be seen moving in a singular and mysterious manner in the clutches of a mink towards a fissure or hole in some stone pile in the grey of the morning, and should he be pursued, it will be suddenly twitched into a hole too deep to fathom." In a state of nature they feed on frogs, cray-fish, meadow-mice, and rats. Having a good nose their prey is pursued by scent; when captured, it is conveyed in the mouth like the cat.

Some twenty five years ago when black Cochins were first introduced into this country, a friend sent me some very fine specimens of the breed, and they, of course, were visited many time a day. On rising one morning and visiting the hennery I was surprised to find the finest pullet dead on the floor. She was fearfully lacerated about the throat, but the floor was not much bloody. I could not devise the cause, and on each succeeding morning I was greeted with the same sight until my favorites had nearly disappeared. In the meantime I had fastened a severe watch dog in the house to protect the poultry, but in this I was disappointed; finally in despair I summoned to my assistance a shrewd, but roguish negro, acting on the principle that if it takes a rogue to catch a rogue the creature could not fail to be brought to justice. My detective scrutinized the premises carefully, and for a time was baffled until one morning after a rain he found foot prints of a mink in the wet clay which he traced to a small adjacent stream. He demanded one dollar each for every mink caught near the hennery. The traps were prepared and set, and each morning brought from one to two minks until they numbered thirty, when I deemed it prudent to close the contract, having had sufficient revenge. As I counted the silver coin, and each piece struck with a decided clink his broad palm, he showed his white ivories and chuckled audibly. The joke was good, for I afterwards learned that he had traps set for miles around my premises. A friend who enjoyed the joke rather more than I, has recently affirmed that this was a death blow to minks for not another one has since been seen in this vicinity.

Mink are fond of water, and are good swimmers. They are not cunning and are easily caught in a trap or deadfall. They do not burrow but avail themselves of the holes of any other vermin. They cannot climb a smooth surface and seldom take to a tree except to evade danger.

The month of March is considered the running season. The female remains in heat four days, and it has been observed that when a number are confined within an enclosure, that this season is confined within a period of ten days. One male will serve six females. The females carry their young six weeks, and in kittening they do not vary half a day from this time. They seldom have less than three or more than ten young at a time, which are blind and destitute of hair. In five weeks their eyes are open, and by that time they are covered with hair which is beautiful and glossy. The females obtain their growth in ten months, the males are grown when eighteen months old. The females are ready to assume the responsibility of mothers when one year old. In a litter of young, one sex or the other are apt to prevail. A grown male weighs about two pounds and the female one and three-quarter pounds.

During the running season the males fight desperately, and if confined in a yard one assumes the mastery. Mink never breed at unseasonable times, and never have more than one litter a year. Farm mink are stronger than wild ones, and invariably whip in an encounter. This is undoubtedly owing to the kind and amount of food taken. They are readily tamed when taken in hand. By the time their eyes are beginning to open, they should be taken from the mother and fed by hand. They resemble kittens in their playful antics, and are troublesome pets; their keen scent often enables them to detect food not intended for their use. Farm mink make excellent ratters, and they hunt with energy and speedily exterminate rats. When rodents find they are being pursued by mink they become bewildered and seem oblivious to the presence of man.

They never give battle, and when overtaken by mink the neck arteries are severed so speedily as not to be observed by the by-stander. Confinement will cause their fur to look dull and rusty. They require a dark place to exercise. Fish given occasionally improves their coat, and soft water for bathing also improves the texture of their fur. They do not relish tainted flesh though if forced by hunger will eat it. The nest of the female is peculiarly constructed with straw, grass, or leaves, and lined with fur from the body of the mother, which is so compacted as to be with difficulty torn to pieces.

The expense of feeding mink is very trifling in comparision with the profits. A moderate estimate claims that a mink with her increase will more than equal the profits of a sow, cow, or mare—any one farm animal.

The (N. H.) *Mirror* gives the particulars of the exploits of some young trappers who gained possession of a pair of old mink with four young. At this season their fur was worthless; they constructed a temporary place to keep them until maturity. A box was made 12 feet long by 4 feet high and six feet wide. One end was placed in a running brook with holes bored through it so as to allow a free flow of water. One end of the box was partially covered with earth, and the top of the box was overlaid with green boughs. The little family were deposited within and increased as opportunity offered until the colony numbered twelve. They were fed on wild meat, wood-chuck, and squirrels, and occasionally fish, caught in nets were added for their use. The mink thrived and grew like pigs. When their fur was in condition they were killed and their skins sold for fifty-seven dollars. The minkeries established in New York, however, find it more profitable to sell the kittens at twenty dollars each than their pelts for five dollars each. The demand is now so great that application must be made months in advance in order to obtain them.

OPENING OF THE CENTENNIAL EXHIBITION.—The Exhibition at Philadelphia was opened yesterday in due from, in great part accordiug to the following programme previously announced. We can give no particulars, as our paper was already on the press before the ceremonies began:—

"The dedicatory ceremonies will take place on the terrace between the Memorial hall and the main building, where semi-circular platforms will be erected and handsomely decorated. Grouped in appropriate positions in this semi-circle, will be the President, the Vice-President, and the Cabinet, the Supreme Court in its robes, and the Diplomatic Corps in "uniform," the United States Senate and House of Representatives, the representatives of the United States army and navy, Governors of States and territories with their staffs, Mayors of cities, the Pennsylvania Legislature, the Board of State Supervisors, the Foreign Commissioners, the United States Centennial Commission, Board of Finance, Government Board of Commissioners, the Women's Centennial Executive Committee, the City Government of Philadelphia, etc. When all these dignitaries are assembled, an orchestra of one hundred and fifty musicians, conducted by Theodore Thomas, will play the national airs of all the nations. The President will be escorted by Governor Hartrauft, of Pennsylvania, and a guard of honor.

After the President has been received, Wagner's march will be performed. Prayer will then be offered; a hymn by John G. Whittier will be read; the remarkably good cantata, which Sydney Lanier, of Georgia, has written for the occasion, will be sung to music written by Dudley Buck, of Connecticut; and General Hawley, as President of the Centennial Commission, will then report to the President, who will then declare the exhibition opened. There will then be salvos of artillery, much ringing of bells; the Foreign Commissioners will disperse to their respective departments, and, while a chorus of six hundred voices renders the "Hallelujah" of Handel, the President, escorted by officials and invited guests, will pass through the main building, then into Machinery hall, where he will, with his own hands, set the great Corliss engine, the motor of thirteen acres of machinery, in motion."

The following are the fixtures for the Centennial season, as given in Lipincott's Guide to the Exposition, which is a reliable authority on these matters:—

Main exhibition opens May 10th.
Grand ceremonies on exhibition grounds July 4th.
Trials of harvesting machines, June and July
Trial of steam plows and tillage implements, September and October.
Exhibit of horses, mules, and asses, September 1st to September 15th.
Exhibit of horned cattle, September 20th to October 5th.
Exhibit of sheep, swine, goats, and dogs, October 10th to October 25th.
Exhibit of poultry, October 25th to November 10th.
Main exhibition closes November 10th.
Exhibits must be removed by December 31st.
Society meetings, parades, regattas, etc.
Knights Templar (Masons) annual conclave May 30th.
Knights Templar (Masons) grand parade, June 1st.
Order of Good Templars, special gathering, June 19th.
International regatta (New York harbor) June 22d.
Yacht regatta, Delaware River, in June.
Sons of Temperance, special gathering, June.
International series of cricket matches, June and September.
Congress of authors in Independence Hall, July 2d.
Parade of Irish societies, (dedication of fountain), July 4th.
Parade of military organizations, July 4th.
United American Mechanic's parade, July 8th.
Knights of Phythias parade, August 23d.
International rowing regatta, August 30th to September 15th.
International rifle matches in September.
International medical congress, September 4th.
Independent Order of Odd-Fellows' parade, September 20th.

—Old fishermen prophesy an unusual season of plenty for fish of every description in our waters.

GAME PROTECTION.

TRAPPING PINNATED GROUSE.—We had flattered ourselves that the wholesale trapping of pinnated grouse, (prairie chickens), which has been going on so uninterruptedly for years past, had this year received a check, for which we had to thank either stricter legislation or an unusual season, probably the latter. Certain it is that "chickens" have never before been so scarce and high in price. In previous years, towards the close of the season, the birds have retailed for half a dollar a pair, but this year the 1st of March saw them at the same figures as had prevailed throughout the winter, viz.: one dollar and a half a pair. It was generally supposed this was not owing to any scarcity of birds, but to the fact that the mild season and light falls of snow had enabled the grouse to find shelter and an abundance of food without placing themselves within the reach of the lures of the netter and trapper. The following letter from a Canadian correspondent would, however, indicate that both our arguments and aspirations were at fault, and that the netted birds have been finding a market other than our own:—

NEWCASTLE, Canada, April 29th, 1876.

EDITOR FOREST AND STREAM:—

Cannot something be done to prevent the intel extermination of pinnated grouse now going on in the western States? At Toronto, yesterday, April 28th, I saw from 50 to 75 brace of birds exposed for sale; they had all been trapped; were fresh, and I should say had not been killed more than three days. On inquiry the dealers told me that they were just in from Chicago, and were shipped to them by a man named Booth, from whom they had received game weekly for some time. I have written to the Chicago *Field*, and trust by that means to call the attention of the local game association to the matter, but I think it should be brought before the Protective Association for the United States so that sufficient influence can be brought to bear to get the game laws in the prairie States so amended as to give power to detectives to open packages in the hands of express companies when suspected to contain game killed illegally; and also to make such companies liable for a penalty when game is found in their possession. This would at once put a stop to the pot hunters trade. I am advised that 35th Victoria Chap. 38, Sections 2 and 4 of the Statutes of Ontario would apply to pinnated grouse. If so, the dealers here will be made an example of, as I have called the attention of the Toronto Game Protective Society to the matter. JOHN J. ROBSON.

The remedy, as far as Canada is concerned, lies with Canadian sportsmen. We, on our side, are doing all in our power, and it is not improbable that the scarcity in our markets the past season was owing to a wholesome dread on the part of the pot hunters of the penalties of the law. It is simply absurd to have game birds like pinnated grouse selling in the markets at half the price of dung-hill fowls. A fact indicative in itself of lawlessness and poaching, and still more so of the certain extermination ahead.

—The New York Association for the Protection of Game held its closing meeting of the season on Monday night at the residence of Royal Phelps, Esq., a large number of members being present. It was a meeting of more than ordinary interest and importance, as was shown by the correspondence laid by the Secretary before the association, between Senator Kennaday and Assemblyman Sherman, relating to the amendments to the Game laws introduced in the Legislature, from which it appeared that while the association were under the impression that measures were being enacted for the protection of fish and game, they discovered, in the closing hours of the session, that an amendment had been introduced in the Assembly in the interests of the law-breaking marketmen which was exceedingly objectionable, and would be fatal to all the other amendments introduced by the Association, and destroy the efficiency of their body.

The President said that when this objectionable amendment—section 6—startled them into prompt action, he had written to Mr. Shearman, Chairman of the Committee, protesting against its passage, and informing him that did such a measure pass the New York Association would be compelled to dissolve, as the marketmen could violate the law at pleasure, and be able to protect themselves from punishment of any kind. He was able to state, fortunately, that this amendment had not passed, nor had the amendments introduced by the association, so that the game laws remained just as they were last year, with the exception of a very valuable amendment introduced by Senator St. John, amending sections 3, 6 and 9 of chapter 831 of the laws of 1871, which has passed both houses of the Legislature, and was now before the Governor for his signature.

On motion of Col. Wagstaff, the association approved the amendment, and passed a resolution requesting the Governor to sign it.

Senator Kennaday, who was present, detailed the efforts made by the Senate and Assembly Committees on Amendments to the Game Laws to pass the amendments introduced by the association. Owing, however, to the delay incurred in the Assembly by the addition of various amendments, when the bill reached the Senate there was not a sufficient time before the close of the session to give the amendments that consideration which so important a measure demanded.

A vote of thanks was passed to Senator Kennaday for the zealous efforts on behalf of the association at Albany, and a committee was appointed to represent the association at the State Sportsmen's Convention at Geneseo on the 22d inst.

The usual communications were read in the early part of the evening, including one from Seth Green, calling attention to the increase in quantity and decrease in price of North River shad.

The President, in closing the session of 1875-6, reviewed the labors of the association during the session, and that they might well congratulate themselves on the results accomplished, and their effect on other sportsmen in every State and Territory of the Union.

The meeting then adjourned to the supper room, where a banquet to commemorate the close of the season had been prepared by J. W. Phelps.

NOTE.—It will be seen by the second clause above that the game law of the State has not been changed, nor will it be unless the amendment of Senator St. John should receive the Governor's approval.

THE NEW YORK STATE SPORTSMANS ASSOCIATION.—The annual meeting of this Association has now been definitely fixed to commence Monday the 22d inst. The first day will be devoted to business, and the 23d, 24th, 25th and 26th to pigeon shooting, etc. 12,000 birds have been procured for the occasion, trapped in Michigan and delivered at Geneseo for $1.75 per dozen live count. A Bench Show of dogs will also be held at the same time, particulars of which will be found in our kennel column. The Livingston Sportsmans Club, under whose auspices the shooting will be conducted, have elected the following officers for the ensuing year. President, M. K. Scott; Vice-President, Dr. E. G. Chase; Secretary, G. D. Mercer; Treasurer, E. N. Shepard. W. A. Stevens, M. L. Forsyth, L. W. Crossett, J. W. Clement and T. F. Olmstead were elected as Executive Committee. E. N. Shepard, H. L. Arnold, A. W. Butterway, Finance Committee. Delegates to attend the State Convention, W. W. Bishop, Geo. W. Barney, Jr., R. A. Kneeland, Willard and W. A. Stevens.

—The Geneseo Club have elected the following delegates to the State Convention, John Rorbach, W. T. Howard, George Williams, M. H. Rector, Lewis Daton.

—At a recent meeting of the Onondaga County Sportsmen's Club the following gentlemen were elected delegates to the State Convention: Hon. F. E. Carroll, S. W. Sherlock, George W. Gray, John Bedford, and W. S. Barnum. The following are the alternates: Thomas E. Townsend, Thomas Kimber, Jr., W. Stalbanm, R. B. Strong and Thomas Brazel.

NEW JERSEY.—An association has been formed in Newark to be known as the Essex Associatiou for the Protection and Propagation of Game. The officers are: President, Dr. Pindell; Vice-President, Mr. J. Belcher; Secretary, Mr. Wm. Hayes; Treasurer, Mr. J. Poinier; Executive Committee, Messrs. A. P. Baldwin, Wm. Knecht, T. Osborne, Dr. A. W. B. Crane and W. Williams with the foregoing officers.

WEST JERSEY GAME PROTECTIVE SOCIETY.—This society met at Camden, N. J., last week, President Walker, of Vineland, in the chair.

Secretary Miller reported a balance of $700 on hand.

Mr. Emlen, for the committee on laws, read a bill now before the legislature making October 1st the end of the close season for pheasants and quail.

Mr. Richards, of the committee to propagate game birds and fish, reported that, owing to the open season, they were not able to procure as many birds as were ordered. Those received were distributed to those who did not get any last year. Thirty-five thousand salmon eggs had been placed in various streams and hatched with encouraging success.

Mr. Richards stated that it is believed that the streams of South Jersey are suited to the growth of the salmon. He also reported that the black bass placed in the creeks by the society are doing well.

Mr. Pierce said that the creeks between Camden and Woodbury were lined with nets, and that Mr. Howell, the fish commissioner, intended to prosecute the offenders.

Attention was called to the practice of gathering birds' eggs, and Mr. Price, of Atlantic County, said that egg gathering was followed as a business along the shore, and that it is not known to be unlawful by the people.

The President read the law which inflicts a penalty of $10 for robbing birds' nests, except they be predatory birds.

The committee on prosecutions were instructed to prosecute those violating the law.

The committee on propagation was instructed to use not more than $500 for the stocking of streams with game fish.

After the transaction of other business the meeting adjourned.

PENNSYLVANIA.—A correspondent writes us from Pittsburg that the Sportsmen's Association of Western Pennsylvania is in very successful operation, numbering over 200 members, with more constantly applying for admission. He writes:—

"Our markets and commission houses contained no game or fish out of season during the past year, with one or two exceptions, which were properly attended to, and in the future there will probably be little or no trouble in this respect here. These violations were always of a flagrant character heretofore in Pittsburgh. The association has recently removed to their present spacious and elegant quarters on Fifth avenue, where a large and rapidly-increasing number of handsome specimens, brought to bag by the members, adorn and instruct.

A handsome specimen of the swan, (*Cygnus americanus*), shot just below Pittsburg, has been mounted and presented to the association, rare only in the fact of his stopping near this busy haunt of civilization and manufacture, and as he was a great stranger and alone, he was, as a matter of hospitality, taken in and cared for.

What's the matter with our Ohio friends that they want to make a close season for quail till December, 1877? the birds are plentiful in that State, and ample protection could be given them by making a short open season, say from 1st to 31st December of each year. Let us hear from our friends over the border about the object and necessity for the law.

SOUTH FORK.

CONNECTICUT.—A few years ago a severe flood which visited certain sections of this State, quite cleaned out the already depleted waters of their fish. This, and the growing scarcity of game resulted in the formation of The Salisbury Bird and Fish Protective Society. Regarding their operations, a correspondent writing from Lakeville, Conn., says:—

"Such a thing as a prosecution for violation of the game laws had never been known here, and some of the citizens rather scouted the idea of our accomplishing any good, but after one or two violators of the law paid a good fair price for their amusement people began to think that there was really something in it. And we are now recruiting our ranks from good substantial citizens who are not personally fond of sporting but who are glad to have the little birds protected." W. H. W.

OHIO.—The latest amendments to the game laws of this State make a close season for quail and prairie chickens until November 15th, 1877, and after that date from January 1st until November 1st for quail; from January 15th until November 1st for wild turkeys; from January 1st until September 1st for ruffed grouse and teal; from April 1st until September 1st for mallard, wood, and other varieties of duck, and from January 1st until July 4th for woodcock. The trespass law which promised to be so obnoxious was not passed, at least not with the objectionable features. As passed it reads almost exactly as does the law of this State, requiring land owners to post their lands, or give the intruder notice to leave before a trespass can be committed. In fact, it goes further, and requires that the boundaries shall be clearly defined by the setting of stakes or by making ditches.

NOVA SCOTIA.—A correspondent writes us as follows:—

I regret that an effort made at the last meeting of the Council of the Game Society of N. S. to prohibit all shooting (but duck and teal) till Sept. 15th, and then begin at partridge (ruffled grouse, *T. umbellatus*), cock and snipe simultaneously fell through—the majority dreading to open a door to any legislative change until the close time for moose (*C. alces*) had expired.

As to this noble animal, which has been much favored by an almost snowless winter, he is again becoming more plentiful. During a caribou hunt this winter of some duration, I could have certainly shot 20, and in one day's weary walk of a 36 miles' loop from and back to camp, I entered six yards, and must have *gone round* many more.

OBITUARY.—It is with keen regret that we record the death, at Paris, last week, of Mr. Benj. F. Bowles, of Springfield, Mass. To the general public, Mr. Bowles was perhaps better known through his connection with the Springfield *Republican*, of which he was part proprietor, and for a long time business manager. But to sportsmen he was known far and wide as a lover of field sports. Mr. Bowles was a prominent member of the Rod and Gun Club, of Springfield, and also of the American Fish Culturists' Association, of which he was treasurer. In practical fish culture he took much interest, and his letters, published in the annual reports of the society, are both valuable and instructive. Mr. Bowles visited Europe last fall with his family, contemplating an extensive tour, embracing the Nile, etc. His letters to this paper over the signature of "Druid," written from Algiers as the "Ramblings of a Sportsman," will be remembered by our readers as exceedingly interesting contributions to sporting literature. Mr. Bowles was a contributor to FOREST AND STREAM almost from its start, and labored constantly to promote its success. He was forty-two years of age. He died of Roman fever.

—The season for deer shooting may be supposed to end in Florida, when the closing of the hotels ceases to provide a market for the venison. This is about May 1st. The St. Augustine Hotel alone keeps four hunters constantly employed, and that caravansary having now closed its doors, the occupation of the professional Nimrods is gone, and they have accordingly emerged from the bush. The deer will now have a rest until fall; yet very many does, heavy with fawn, have been destroyed, and the waste must have an appreciable effect to diminish the supply of this game should the slaughter continue uninterruptedly in this manner. The hunters referred to report having killed about twelve deer per week for the last four months—or, say, 200 head. Their favorite hunting ground is at Benlah, fifty miles south of St. Augustine. Now, as there are at least a dozen hotels in the State that may be deemed first class, besides a score of minor ones, the number of deer killed during the winter for their use, cannot be much less than 2,400. The number killed by sportsmen and residents for private use can only be estimated.

—Our constant friend "Guyon," of Corinth, Mississippi, has sent us three beards of wild turkeys, shot by himself and Mr. John N. Duncan, which are more than patriarchal in their length and general aspect. One of them measures 10½ inches in length, and, as the sender says, probably belonged to a gobbler of the Mormon persuasion, so that we can now safely swear "by the Beard of the prophet," in due oriental form. The other was evidently sported by a young galopavo of the Beau Brummel order, as it is curled and crimped at the end. To outwit one of these old boys who wears a beard in this style, is certainly an achievement of which a sportsman may well be proud. Human intelligence and skill opposed to animal cunning, and the animal cunning usually comes out ahead.

OUR JOURNAL IN CANADA.—Benj. Smith, Esq., member of council of the Nova Scotia Game Protective Society, says of FOREST AND STREAM:—

"Your paper has become so great a favorite among Canadian sportsmen as to be a *sine qua non*."

Samuel Wilmot, Esq., Superintendent of the Dominion Fish Works, at Newcastle, Canada, in sending an official communication to FOREST AND STREAM, remarks:—

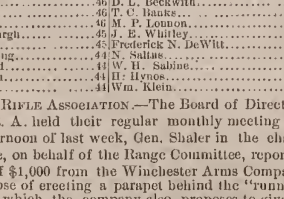
"As your paper is becoming so widely distributed, it is the best medium by which any information of this kind can be disseminated."

—From observations taken at New Smyrna, Florida, by Maj. George G. Alden, we find that the mean mid-day (2 P. M.) temperature was 80°. Lowest temperature during the month, 55°; highest, 86°.

—There were cut on Crown Timber Lands of New Brunswick, Canada, last year, woods of all kinds equivalent to about one hundred and ten million feet. This season the yield will probably be one hundred million feet,

The Rifle.

CREEDMOOR.—Saturday was a day at which no rifleman could grumble, and the scores made in the various matches are above the average. The first event was the long range match for the Luther badge, open only to members of the Amateur Rifle Club, for which there were twelve entries. The conditions were, five shots each at 800, 900, and 1,000 yards. Mr. W. B. Farwell was the winner, but the leading scores, as will be seen by the list below, were remarkably close:—



Names.	Yards.	Score.	Total.
W. B. Farwell	800	5 5 3 4 5	22
	900	5 5 3 4 5	22
	1000	4 4 2 3 3	16

J. B. Holland	0 0 3 3 4 5 2 3 2 4	26

The programme at Creedmoor for next Saturday will include the second competition for the "Hepburn" trophy at 800, 900, and 1,000 yards, commencing at 11 A. M., and the sixth competition for the *Turf, Field and Farm* badge, at 200 yards distance, at 3:15 P. M.

CONLIN'S GALLERY.—We give herewith a cut which is an exact copy of the champion target winning the champion's pin at this gallery. It was made by Mr. L. V. Sone, April 20th 1876, 10 shots with rifle, 110 feet, off hand. The pin was offered for the first fall score (50 out of possible 50) on 200 yards; Wimbledon target reduced in proportion for the range, made in the gallery, and after seven months constant practice by the most expert gallery shots in the city, Mr. Sone accomplished the almost impossible feat. The following is a list of the best scores; highest possible score, 50:—

Name.	Score.	Name.	Score.
L. V. Sone	50	C. G. Peters	46
W. B. Farwell	49	J. Woodward	46
Chas. A. Cheever	48	Wilson Macdonald	46
G. E. Blydenburgh	47	G. W. Hamilton	46
Wm. Hayes	47	Thomas Lloyd	45
J. B. Blydenburgh	46	J. D. Cheever	45
G. W. Yale	46	D. L. Beckwith	45
T. C. Noone	46	T. C. Banks	45
L. C. Bruce	46	M. P. Lonnon	45
H. D. Blydenburgh	45	J. E. Whitley	44
J. O. Wright	45	Frederick N. DeWitt	43
Gen. W. E. Strong	45	Sallas	43
W. J. Sherwood	44	W. H. Sabine	43
T. J. Dodworth	44	H. Hynes	43
Geo. P. Work	44	Wm. Klein	42

NATIONAL RIFLE ASSOCIATION.—The Board of Directors of the N. R. A. held their regular monthly meeting on Tuesday afternoon of last week, Gen. Shaler in the chair. Col. Wingate, on behalf of the Range Committee, reported the receipt of $1,000 from the Winchester Arms Company for the purpose of erecting a parapet behind the "running deer" target, which the company also proposes to give to the association. On motion of Gen. McMahon the Prize Committee were authorized to procure prizes for the matches in the spring meeting, at a cost not to exceed $450. The President announced that to erect a commodious headquarters at Creedmoor $1,500 had already been donated. The term "Special" military guns in matches was decided to mean all rifles not in use by the troops of any organized Government. On motion of Col. Wingate, it was resolved that the convention of riflemen, which had been announced to be held during the spring meeting, should be convened at the head quarters tent at Creedmoor, May 25, at 12 o'clock noon, when the roll of delegates will be called. In order to give concert of action to matters regarding rifle practice it was resolved to invite all the rifle associations throughout the country to send delegates to the convention or a written statement to the Secretary of such matters as they may desire to have acted upon. After the election of five life members the meeting adjourned.

THE INTERNATIONAL MATCHES.—The Joint Committee of the National Rifle Association and Amateur Rifle Club, having in charge the International Rifle matches to be contested at Creedmoor next fall, held a meeting yesterday afternoon, Gen. McMahon, the President, in the chair.

It was resolved to limit the expenditure for the Centennial trophy in the long range match to $1,000. Major Gen. Shaler, Col. Gildersleeve, and Col. Mitchell were appointed a committee to prepare a programme for the entertainment of foreign and out-of-town guests at Creedmoor on the days of the matches.

THE IRISH RIFLEMEN.—Dispatches from Dublin under date of May 2d, announce that the competition for places in the Irish Rifle Team to visit this country, commenced at Dundalk on the 29th ult., and were to be continued during the six successive Saturdays. Two squads consisting, No. 1 of Messrs. Johnson, Pollock, Patrick, and Franks, and No. 2 of Messrs. Rigby, Traill, Goff, Joynt, fired 15 shots per man at 800, 900, and 1,000 yards, scoring a grand total for No. 1 of 711, and for No. 2 of 674.

Most of those likely to compete for places in the team come from the north of Ireland or the neighborhood of Dublin. Dundalk lies close to the borders of both provinces, and is neutral ground. The military authorities have given the use of their rifle range.

Each competitor will be required to fire each day fifteen shots at each of the three ranges. The ten best men on the aggregate scoring will be selected; four additional men will be nominated by the captain. These fourteen will again compete, and the ten best will form the team of eight and the reserve. The actual components of the team will not, however, be finally selected until practice in America has decided their relative merit.

The second competition took place on Saturday last. The score resulted in a tie. W. Rigby made a score of 211 out of a possible 225, which has been seldom equalled. Of his 15 shots 34 were bull's eyes. Other scores were: Milner, 203; Goff, 195; Traill, 189; Patrick, 168; Dyas, 177; Joynt, 164.

SCHUETZENFESTS.—The Columbia Rifle Association will hold their opening spring meeting on the 15th inst., at their grounds at Gutteuberg, N. J. Shooting off-hand, at 200 yards, any rifles, open to all comers. Tickets entitling the holder to three shots at the Centennial ring target, $2 each; fifteen prizes to the amount of $160. N. B. Centennial ring target means the target adopted by the American Shapshooters' Society, and which will be used at the grand shooting tournament at Philadelphia from June 26th to July 7th. This target is divided into twenty-five different rings of one half inch diameter each. Bull's-eye or pool tickets, ten for $1. The opening festival of the United Schuetzen Association of Jersey City will take place at the Schuetzen Park at Bergen avenue, Jersey City, (Greenville), Tuesday and Wednesday the 16th and 17th inst. They open bull's eye, man, and ring targets, at a distance of 200 yards, and open to all comers.

—Attention is called to the advertisement of J. W. Hayes & Co., 922 Broad street, Newark, N. J. We have had the pleasure of admiring the superbly executed medals this firm have made for the Centennial shooting contests. They also made the FOREST AND STREAM badges. They have an artist who is very superior in the conception of designs, and the firm will take great pleasure in furnishing badges and medals to suit the taste of the gun clubs, rifle clubs, or other associations.

MASSACHUSETTS.—The Worcester Sportsmen's Club have adopted the rules and regulations of the National Rifle Association, with the single exception of the third class target. Taking the Wimbledon target at 200 and 300 yards; 8 inch bull's-eye, 15-inch centre, 28 inch inner, 40 inch outer. The following are the scores made on the 4th inst. Wimbledon targets, off hand:—

200 YARDS, OFF-HAND.

Name.	Total.	Name.	Total.
Stedman Clark	14	A. F. Hatch	16
G. J. Rugg	16	A. L. Rice	10
A. P. Cutting	17	Frank Wesson	7
C. B. Holden	12	A. E. Grimes	15
A. G. Mann	18		

600 YARDS.

Name.	Total.	Name.	Total.
Stedman Clark	29	A. F. Hatch	4
G. J. Rugg	22	A. L. Rice	5
A. P. Cutting	17	Frank Wesson	7
C. B. Holden	22	W. S. Perry	5
A. G. Mann	18	E. S. Knowles	10

NEW ORLEANS RIFLE CLUB.—At the range of the New Orleans Rifle Club there was very little shooting done April 30th, the heat no doubt keeping the members at home. The shooting is almost entirely on the Centennial target. Mr. A. Wattenhofer, the champion last shooting day, again walked off with the honors on the latter target on a score of 165. The following are the names of the winners on the off-hand cartoon targets: First prize, M. Winteler; second prize, H. N. Soria; third prize, A. Wattenhofer; fourth prize, J. C. Shipley.

The Crescent City Rifle Club tried the red bull's-eye in place of the black. As there was some controversy some time since in regard to the superiority of the red over the black, I shall report next week if it works satisfactorily or not. The following are the leading scores at 1,000 yards:—

Name.	Total.	Name.	Total.
George Howe	56	John Glynn, Jr.	45
J. K. Renaud	56	James Buckley	42
Dudley Sept	55	Wm. Arms	37

NEW YORK.—A match was shot last week between the Geneva Rifle Club and the Amateur Club of Rochester, the former using muzzle-loaders weighing from twenty to thirty pounds, of .53 calibre, while the Rochester men used guns weighing but ten pounds. The former were allowed to rest the muzzles of their guns on artificial rests, but the Amateurs were not allowed that advantage, but had to bind fast their Creedmoors in a sort of living vice, made by twisting their bodies into the peculiar position known as "Fulton's position." The advantage of greater weight in a gun and liberty to rest its muzzle artificially is enough, skill being equal, to win a victory every time, and although the Genevas are to be congratulated on their skill and good fortune, justice requires that the probable cause of the result should be stated. The following is the score at the long range:—

GENEVA TEAM.

Name.	Score.									Total.
Gaylord	4	4	4	4	5	4	5	5	5	45
Lingle	3	5	3	4	0	5	3	4	5	35
Smith	4	4	2	2	0	4	5	3	5	34
Fleming	2	5	4	0	4	3	5	4	0	31
Miller	0	3	5	3	3	2	2	0	3	24
Roberts	0	3	0	2	2	5	3	5	4	24
Post	2	5	2	3	3	0	2	2	3	22
Grand total										215

ROCHESTER TEAM.

Rider	3	3	4	4	0	3	5	3	5	33
Yates	3	3	3	5	3	4	4	5	3	33
Combs	0	3	4	2	5	5	5	3	3	30
Hart	3	3	0	4	5	5	0	4	5	30
Stillson	3	0	0	3	4	3	5	4	0	25
Brown	4	0	0	5	0	4	4	2	3	24
Servis	2	3	3	4	4	2	0	0	0	23
Grand total										198

The time consumed in shooting this match was so long that it became impossible to shoot a full team match at short range, but three individuals from each club shot an off hand match at 200 yards, which resulted in a triumph for Rochester by the following

SCORES.

Name.	Score.									Total.
Rider, of Rochester	5	5	4	4	4	4	4	4	5	43
Smith, of Geneva	3	4	2	1	4	4	3	3	2	5	35
Rider winning by eight points.										
Stillson, of Rochester	4	5	4	5	4	4	4	4	4	5	43
Miller, of Geneva	3	4	4	4	5	5	4	4	5	4	42
Stillson winning by one point.										
Yates, of Rochester	3	4	3	3	4	4	4	3	4	4	36
Gaylord, of Geneva	3	4	2	4	4	5	3	4	3	3	33
Yates winning by three points.										

E.

SHORT BARRELS FOR RIFLES.

CHICAGO, Ill., May 3d, 1876.

EDITOR FOREST AND STREAM:—

In reply to one of your correspondents, in your paper of 27th ult., you say "200 yards is rather too far for a 20-inch barrel." Ten years ago, after a great deal of experimenting with barrels of different lengths, I adopted the 20 inch Maynard as my favorite arm for all sporting service, having convinced myself that for any but the extreme ranges, which are sometimes required on the plains, it was equal to any possible demand, and the convenience with which it can be packed and carried making it the best weapon I know to carry on journeys, and to have ready at all times for real work. I have won matches with it at 220 yards in competition with muzzle and breech-loading rifles of great number and variety. I once put ten successive shots in a five inch ring at 200 yards, killed a wild goose at 100, cut off the head of a bittern at 150, and, generally, have found it more reliable than the old muzzle-loading rifle, which for many years I thought to be the best that could be produced. Mine is a 4-10 calibre, which of course would be more reliable than a 32, which your correspondent asks for; but for any distance required in ordinary service, and for a much longer range than 200 yards, I am sure from my own experience, and that of many others with which I have been familiar, that a 20-inch barrel is all sufficient.

H. W. S. CLEVELAND.

PHILADELPHIA, May 3d, 1876.

EDITOR FOREST AND STREAM:—

I see in the "Answers" you say "200 yards is rather too far for a 20-inch barrel." May I ask do you refer by this simply to the .32 cal., 20-inch barrel, or to that length in general? I have used a 20-inch Winchester, 1866 model, for several years, and apart from my attachment to the piece from associations, I have never changed it for the new pattern or longer barrel, because I have always found that for ordinary hunting it shot well enough. It has coarse sights and no elevator, but I have at various times shot ducks with it, shooting at them in the water at 200 yards off-hand, and at more than that. I never shoot at a mark once in six months, so I cannot say how regular it would be in a number of consecutive shots at the same object; but as game it seems to have inclusive faculties, which is necessary as to direction. I may add that I have a hard-looking 14-bore shot gun, only 18 inches in the barrels, with which I have killed deer running at 80 yards and over, using Elcy's green cartridges, with 3¼ drachms of powder—Dupont's No. 2 ducking. C. C.

[The disadvantage in a short barrel is in its incapacity for burning more than a limited quantity of powder, particularly where a small calibre is used. Besides, the answer to our correspondent referred to the Wesson *pistol*, fitted with a skeleton stock.—ED.]

Game Bag and Gun.

MAY IS A CLOSE MONTH FOR GAME.

—A number of gentlemen of Philadelphia and New York have formed themselves into a club and purchased two acres of land on Ludlam's Bay, Cape May county, N. J., where they have erected a two and a half story house, 30x40 feet, with sixteen sleeping rooms, which is under the supervision of T. F. Shute and wife. The officers are G. M. D. Peltz, President; T. F. Shute, Vice President; James F. Wallace, Secretary. The title of the club is the Curlew Bay Club of Philadelphia.

—A Boston correspondent relates a singular circumstance that happened last week to a lover of the dog and gun living in the suburbs of one of the adjacent suburban cities. He was awakened quite early with the intelligence that the grounds were full of snipe, and one dog that was already loose was "pointing in all directions." Then there was hurrying to and fro. He seized his gun with a promptitude that would put to blush the Minute man of 1776, and without waiting for reinforcements, was soon in the field. In a short time he bagged nine snipe, losing three from too close proximity to windows of the houses. Mc.

PIGEON MATCHES.

PHILADELPHIA SPORTSMEN'S CLUB.—The seventh annual spring meeting of the Philadelphia Sportsmen's Club was held at Tinuenm on Saturday, May 6th. A great number of invited guests were present, and the day was passed in the most social manner, nothing occurring to mar the general good feeling that prevaded among the members. The usual shooting match took place; 550 wild pigeons were furnished by Mr. S. T. Martin, of Chicago, which are

rived in good order, only 14 being lost on the way to Philadelphia. The prizes contended for were as follows: 1st, a handsome solid silver salver; 2d, a valuable bronze (English partridge); 3d, an emblematic locket. The match was shot from H & T trap, 21 yards rise, 80 yards boundary. The following are the scores:—

Names.	Total.	Names.	Total.
E. C. P.	9	G. K. C.	4
A. E. S.	9	G. R. H	7
J. L., Jr.	7	D. T.	7
H. B. T.	7	M. S. G.	7
J. C. H.	4	A. B.	7
S. P. B.	9	T. C. A.	8
T. L. H.	7	E. M.	8
F. W.	5	A. C.	7
A. N. W.	6	C. M.	7
W. C.	7	J. T. A.	7

TIES FOR FIRST PRIZE.

E. C. P.	1 1 0 1—3	Winner	
J. E. S.	0 1 0 0		

TIES FOR SECOND PRIZE.

E. C. A.	1 1 1 0 1—4	1 1 1 1 1—5	1 0 0 1 1—3
B. M.	1 1 1 1 0—4	1 1 1 1 1—5	0 1 1 1 1—4 Winner.

TIES FOR THIRD PRIZE.

Name.	Total.	Name.	Total.							
J. L, Jr.	0	O. S. G.								
H. B. T.	1 1 0	A. B.	0							
T. L. H.	0 1 1	A. C.	1 1 1—3	1 0	0—1					
W. C.	1 0 0	M*.	1 1 1—3	1 1—2						
G. R. H.	1 0 0	J. T. A.	1 0							
J. T.	1 0	*Winner.								

After the shooting match was over, the members sat down to a planked shad supper, and an enjoyable afternoon was passed in the building of the Tunnum Fish House Club.

BOGARDUS VS. PRICE.—The match between Captain A. H. Bogardus, of Illinois, and Mr. William G. Price, of London, for the championship of the world and the gold badge won by the Captain when in Europe, was decided at Indianapolis on the 5th inst. The following score shows the result:—Fifty birds from five traps, 30 yards rise, English rules. Bogardus, 41; Price, 36. Fifteen pairs, 18 yards rise, Prairie Club rules, of Chicaco. Bogardus, 24; Price, 21. Twenty single birds, 21 yards rise Prairie Club rules, of Chicago. Bogardus, 19, Price, 15. Total—Bogardus, 84; Price, 72.

PIGEON SHOOTING EXTRAORDINARY.

ST. LOUIS, May 4th, 1876.

EDITOR FOREST AND STREAM.—

A supply of wild birds arrived to-day from Chicago for the Gun Club. After a fair club match a novel match was made between Mr. C. Jeff Clark and H. C. Pierce, at 10 single birds, 21 yards rise, 80 yards boundary, the gun to be laid on the ground, the shooter to stand at score with arms folded, and to maintain that position until the trap was sprung and the bird on the wing. Mr. Clark had shot at five birds once before under similar conditions. Mr. Pierce had had no experience in that style of shooting. To the complete surprise of the spectators the shooters tied at ten birds, and afterwards at five birds, same conditions. As the skill of each party had been thoroughly tested under such novel circumstances, without advantage to either, it was agreed to draw the stake and rest upon laurels won. When it is considered that the birds were very strong, wild ones, having but recently been netted, and the wind blowing almost a gale from right to left across the traps, with a cold, drizzling rain prevailing during the entire match, together with the extra labor necessary to secure proper aim under conditions imposed, the score is simply wonderful. As any rate the result is so greatly ahead of the Paine-Talbot match, recently had in New York, and the terms so much more difficult—(Paine and Talbot laying their gun on a table instead of on the ground)—that either gentleman is willing to make a 50-bird single or double match under same conditions, with any one who imagines they know how to do such style of work better.

ST. LOUIS.

MT. VANDERWACKEN.

PHILADELPHIA, April 29th, 1876.

EDITOR FOREST AND STREAM:—

I see in an entertaining article in your paper of the 27th, your correspondent asks where the Vanderwacken Mountain is, as he could not find it on any map. I have been up the Vanderwacken Mountain some years ago, although not quite so far back as the date of the events recorded in your correspondent's article. The mountain lies south of the road from Root's to the Lower Adirondack Iron Works and east of the North River. It is, as he says, an isolated mountain, over four thousand feet high, I should say, speaking from memory and judging from the timber and other signs which those familiar with mountain climbing estimate altitude by. I went up the mountain in the winter of 1869-61, when I spent me five or six weeks in the woods, tramping about on snow-shoes and seeing what was to be seen in contrast to the summer time. The snow was five feet deep on a level, with a good crust, and I have no doubt that in some of the hollows and ravines among the foot hills at the back of the mountain, we walked over drifts thirty feet deep. In order to get a fine view, I left Mitchell Lahattie' House in Pendleton before day, and reached the top of the mountain quite early in the morning. Snow-shoes had to be discarded long before we got to the summit, as we attacked it from the north side, and it is very steep. The top was open and not large, the mountain making a peak. The view was grand. I looked up the long basin in which lay Lake Sanford, the head of it fifteen miles off. Across the end of the valley glistened the wall of the Indian Pass. On the right came toward me in order the rose-colored summits—for all were snow covered, and glowed Alp-like in the slowly rising sun—of Mounts McIntyre, Colden, Tahawas, and others, while on the left lay Seward and Santanoni. I can remember it well to this day. The rose color tipped with gold, then gilding imperceptibly into the softest shades of violet, which again went into purple, until at last, low down on the mountain sides, where the timber was larger and the snow could get to the ground, the dark spruces and balsams looked blue and black in the deep shadows. I went down on the south side of the mountain and took a circuit to the right almost to the river, having meanwhile run down a buck and cut his throat, for Mitchell had said he must have some meat, or we would face hungry at home, and then struck north again to the Crown Point road, which I did not reach until long after dark, or rather night, for it was moonlight and not very dark. One of Mitchell's boys and another youngster were with me, so having plenty of team we put a withe through the deer's nose and fore legs, and "snaked" him on the crust until after night, where we hung him up and went home, sending after him in the morning. If I pass the Vanderwacken again I shall most certainly try to find time to go up it. The view will well repay any one who cares at all for such things. So by the way will the view from Goodenon into a much smaller mountain, and one more easily gone up, not far from Newcomb settlement. C. C.

SNIPE AT THE WEST.

CLINTON, Iowa, May 1st, 1876.

EDITOR FOREST AND STREAM:—

In your issue of April 27th, under head of Game Bag and Gun, you predicted that English snipe had taken a western flight. "You have it right." The largest flight of snipe known for years has just passed over the eastern portion of this State. All along the Chicago and Northwestern Railway, from here to Tama City, every favorable piece of ground has been alive with them, owing to heavy rains. Corn-fields have been favorite feeding grounds, and as the farmers do not cut up their corn it affords fine cover. J. Anderson and G. E. Poyneer bagged ninety-three in six and a half hours' shooting on the 22d inst.; Messrs. Jackett and Poyneer bagged seventy-nine on 25th ult.; Page and Walden bagged sixty-three. Messrs. Morton, Lee, Everett, Holton, and Lamb have the credit of making good bags. Duck shooting was fair. Prospects are very flattering for a big season at pinnated grouse. If we do not have any heavy rains during May and June the shooting will be the finest for many years. ERIS.

THE FLIGHT OF WOODCOCK AND SNIPE.

KENTVILLE, Nova Scotia.

EDITOR FOREST AND STREAM:—

It always gives the sportsman pleasure to find the whereabouts of a brother of the rod or trigger with whom a bye gone day has been pleasantly passed. I therefore note with no ordinary delight a few lines from "Roamer," who is good enough to mention 1874, and the little Chambers who then conduced to our amusement. I am truly glad to hear that he intends looking me up next autumn, and while I regret the superannuation of his old beauties, make no doubt but that "their successors in office" will give a good account of their "days about" with my team. As for that good, thorough going shot, I feel sure that since we last met

"Age cannot wither *him*, nor custom stale
His infinite variety."

One thing I will say for all the gentlemen from over the border whom I have had the pleasure of meeting in the field, they are undeniable workmen, and understand cover shooting and the peculiarities of the "timber-doodle," its probable locality, and line and velocity of flight, and as we drive from cover to cover, smoke the post-prandial pipe, unless they are giving us solid information and the result of extensive personal observation among the fauna of North America. They are admirably fill-ing the role of what dear old Col. Chearnley called "the diverting vagabond."

In answer to "Roamer's" inquiries as to the advent of cock and snipe, I reply that as far as my own observation goes I am inclined to think that the influx of cock from the North is more clearly marked by flights than that of snipe. The latter breed here, both at Tantramar and Kentville in greater numbers than cock, and continuing during their early maturity on the opens it is very difficult to discriminate between flight birds and those driven off the snipe bogs to the edges of the dykes, (as we call our reclaimed grass lands) ditches, and potatoe furrows. But I can say that after easterly and northeasterly rainstorms with wind I find a black bog with scattered alders, I wot of, always well filled with snipe after September 22d. I therefore think they begin to come South earlier than cock, and further, I never killed snipe in November till 1874, when I got two brace on, I think November 10th, upon a bit of black intervale a mile or so west from Kentville, that had been submerged till autumn, and mown high off the ground.

The cock on the other hand, I always shoot until well on in November; even as late as the 16th making bags of three or four couple. Once I flushed a strong, loud winged bird the day before Christmas! It is probable he had been wounded, or *more parentis* been prevented from acquiring a knowledge of geography. The advent of the flight birds depends much upon the temperature in higher latitudes, and the prevalence of northerly gales. I look up well shot covers for new arrivals all along from October 15th to November 10th; after that, likely places. My heaviest bags of evidently flight birds have generally been made about the full moon nearest the 20th of October. I hope, however, to show my old friends some new covers before so late a date. B. S.

TENAFLY, N. J., April 22d, 1876.

EDITOR FOREST AND STREAM:—

In the late issues of your paper, I notice several of your correspondents claim that the scarcity of woodcock is due to the late snows and cold rains in the spring, and last, but not least, to the summer shooting. Now, in our section, the summer and fall shooting is about equal. In July and August we find the young birds in the densest cover, when they flee it is almost impossible to see them. While in the fall, after the leaves have fallen from the trees, we find them among the alders and white birches, where it is very open, and it is often necessary to let them fly some distance, in order to save them whole. Of course we all understand that summer shooting leads to the untimely death of a great many young ruffed grouse and quail, but it does not wholly account for the scarcity of the birds. If your correspondents will take the trouble to look under the telegraph wires, they will find another good reason. For instance, on the 4th inst. one of the trackmen on the rail-road, brought me a woodcock that has been killed by flying against the wire; he was found early in the morning, and was warm when picked up. A year or two ago eight woodcock were found one morning on the Hudson River Railroad, in a distance of two miles, and a short time ago the agent at the depot heard something strike the wire near him, and on looking, found a woodcock that was warm and bleeding. On the 7th inst I found three dead birds in a distance of one and one half miles. Three were found a few miles south of this place a year ago and I have just received a stuffed bird from Piermont that was killed the 17th of March, 1873. It seems that a single wire is the most dangerous as they can see and avoid a large number. Here is another reason: a friend of mine informs me that it used to be a customary practice for the citizens of the Southern States to hunt them at night with torches in the canebrakes, and he has known of seventy-five being killed in a few hours in this way. If this is the case, in a few years woodcock will be a thing of the past, unless the protection societies take hold of the matter. Woodcock have been very plentiful with us this spring, and there are enough left on the grounds to make good shooting when the season opens.

Wilson snipe made their first appearance this week. I shot five on the 26th, and saw two more which were very wild. The weather has been so cold that the flight has hardly commenced, but expect they will be along in large numbers in a few days, when I will send you word.

RED WING.

CHOKE-BORES.

JACKSON, Miss., April 13th, 1876.

EDITOR FOREST AND STREAM:—

Apropos of choke-bores, I have had my gun what Mr. Dougall might call "moderately choke-bored." My gun—you published a trial about two years ago—shot N. 7, Tatham's, badly, making a pattern of 125 pellets in a 30-in. circle, with 2¾ drs. orange lightning powder and 1¼ oz. shot. Now with 3¼ drachms American dead shot and 1¼ oz. No. 7 Tatham's shot, it gives an average pattern of 182 pellets in a 30 inch circle, not selected. It has improved the gun's shooting with No. 8 as well. Of No. 10 shot I kept no record, and here state positively, in regard to my gun, at least, that it has not lost in penetration, having broken both hind legs of an old hare—besides killing him so dead he never straggled—at about 40 paces, with St. Louis No. 10 (Tatham's) shot.

In regard to shooting a choke-bore at snipe or partridges I would say, to a poor shot like myself, be slow about bringing your gun to your shoulder; or, as Frank Forester says: "Keep your gun at half-cock, and cock it only after the game is on the wing." If you don't, you'll score more misses than birds, as I do.

In conclusion, one word about Mr. Dougall's statement that "closeness and velocity are antagonistic." With all due deference to Mr. Dougall, I question that statement. I shot my gun before it was choke-bored at a yellow pine plank; the shot entered it simply. I then used one of Eley's concentrators, and it splintered the board. I then took two concentrators, filled them with shot, with a wad at either end, and tied it together with fine wire. It tore a hole through the wood like that made by a grapeshot; all shots so fired at same distance, same size shot, and at different parts of the plank. A cartridge so made would knock down an elephant at close quarters.

If above is not analogous I would like to be informed why it is not; but is, in my humble opinion, if not a complete refutation, at least one that requires explanation in regard to "closeness and velocity are antagonistic" being accepted as gospel truth. GEO. C. EYRICH.

Rational Pastimes.

BASE BALL.

—The national game has never been played with the degree of skill it is this season, as the record of the leading contests which have thus far taken place fully shows. Thus far, in the League pennant series of matches, the Chicago Club takes the lead out West, and the Hartford Club in the East, each having won five games and lost but one up to May 9th. The model games thus far played in the West by the League clubs have been:—

St. Louis vs. Chicago, at St. Louis.....1 to 0
Cincinnati vs. St. Louis, at Cincinnati.....2 to 1
Chicago vs. St. Louis, at St. Louis.....4 to 3
Cincinnati vs. Louisville, at Cincinnati.....3 to 2
Chicago vs. Louisville, at Louisville.....4 to 0
Cincinnati vs. St. Louis, at Cincinnati.....5 to 4
St. Louis vs. Louisville, at Louisville.....6 to 2

The model games of the East are as follows:—

Mutual vs. Athletic, at Brooklyn (12 innings).....3 to 2
Hartford vs. Boston, at Boston (10 innings).....3 to 2
Hartford vs. Mutual, at Brooklyn.....4 to 3
Hartford vs. Athletic, at Philadelphia.....7 to 4
Hartford vs. Athletic, at Philadelphia.....6 to 3
Boston vs. Athletic, at Philadelphia.....6 to 5
Mutual vs. Boston, at Boston.....5 to 1
Athletic vs. Mutual, at Philadelphia.....7 to 5
Boston vs. Mutual, at Brooklyn.....7 to 6
Mutual vs. Hartford, at Brooklyn.....8 to 3

The record in full of the League contests is as follows:—

	Athletic.	Boston.	Chicago.	Cincinnati.	Hartford.	Louisville.	Mutual.	St. Louis.	Games won.
Athletic	..	1	0	0	0	2	0	0	3
Boston	1	..	0	0	0	2	0	0	3
Chicago	0	0	..	2	0	2	0	1	5
Cincinnati	0	0	0	..	0	1	0	2	3
Hartford	2	2	1	0	..	0	1	0	6
Louisville	0	0	0	1	0	..	0	1	2
Mutual	1	1	0	0	1	0	..	0	3
St. Louis	0	0	1	0	0	1	0	..	2
Games lost	4	4	1	3	1	4	5	4	26

The single figure contests in which professional nines have been engaged since our last issue are as follows:—

May 1—Chicago vs. Buckeye, at Columbus.....5 to 0
May 1—Mutual vs. Athletic, at Brooklyn (12 innings).....3 to 2
May 2—Boston vs. Fall River, at Fall River.....6 to 2
May 3—New Haven vs. Hartford, at Hartford.....6 to 4
May 4—New Haven vs. Hartford, at N. Haven (10 in).....7 to 6
May 4—Boston vs. Harvard, at Boston (11 innings).....4 to 3
May 4—Riverside vs. Aumbers, at Louisville.....7 to 5
May 4—Cincinnati vs. Louisville, at Cincinnati.....3 to 2
May 5—Hartford vs. Mutual, at Brooklyn.....4 to 3
May 5—St. Louis vs. Chicago, at St. Louis.....1 to 0
May 5—Stars vs. Ithaca, at Syracuse.....6 to 6
May 5—Harvard vs. Suffolk, at Cambridge.....8 to 1
May 5—Braddock vs. Allegheny, at Allegheny.....9 to 3
May 6—Hartford vs. Athletic, at Philadelphia.....6 to 3
May 6—Chelsea vs. Brooklyn, at Brooklyn.....9 to 3
May 6—Alaska vs. Nameless, at Brooklyn.....5 to 4
May 8—Mutual vs. Boston, at Boston.....5 to 1
May 8—Hartford vs. Athletic, at Philadelphia.....7 to 4
May 8—Louisville vs. Capital City, at Indianapolis.....6 to 5
May 8—Chicago vs. St. Louis, at St. Louis.....3 to 2

Among the best amateur games are the following:—

May 6—Charter Oak vs. Trinity, at Hartford.....2 to 1
May 6—Eureka vs. Contest, at Brooklyn.....7 to 5

The double figure games were as follows:—

May 2—Chicago vs. Cincinnati, at Cincinnati.....15 to 9
May 3—Louisville vs. St. Louis, at Louisville.....11 to 0
May 3—Athletic vs. Mutual, at Philadelphia.....11 to 5
May 6—Boston vs. Mutual, at Boston.....13 to 3
May 6—Louisville vs. Cincinnati, at Louisville.....13 to 3

RUTGERS ATHLETICS.—The spring trial of athletics at Rutgers College was held Friday, May 5th. The standing long jump was won by J. Bishop, '78, distance 10 feet 9 inches. The running long jump by O. Maynard, '78, distance 17 feet 2 inches. The base ball was thrown 316½ feet by Robert Fischer, '77. Best hop, skip, and jump, made by O. Maynard, distance 37 feet 4 inches. D. Randolph, '79, won the two mile walk, time 15 minutes 47 seconds; Lyall, '76, making it in 15 minutes 46 seconds, but was ruled out for skipping at the beginning of the second mile. The prize for the 100 yards dash was awarded to Whitehead, '77, time made, 10 seconds. Great enthusiasm was manifested throughout. Judges, Prof. Roekwood, Ph. D., Alex. Johnson, A. B., A. Martine, A. B. S.

INTER-COLLEGIATE ATHLETICS.—The gentlemen who were appointed last December by the Inter-Collegiate Athletic Association a committee to arrange for this years games, recently visited Saratoga, and selected for the purpose a field in the vicinity of the Clarendon Hotel on Ballston Avenue. A grand stand, tents, dressing houses, etc., are to be created, and the whole made into as complete a track as there is in the country. Although at the meeting of the association in January the motion to invite Oxford and Cambridge, England, and Trinity, Dublin, to participate was lost, there is reason to believe that an invitation will soon be extended to them. Their presence would, of course, add greatly to the interest in the contests. The following is the program of the meeting:—

For undergraduates, 3 mile run; 1 mile run; ¼ mile run; ¼ mile run; 100 yards dash; 120 yards hurdle; 1 mile walk; 3 mile walk; running high jump; running long jump; throwing the ball; putting the 16 pound shot; 3 legged race. For graduates, 1 mile run; 1 mile walk. Entries for any of these contests will now be received by the chairman of the committee.

PRINCETON SPORTS.

PRINCETON, May 6th, 1876.

EDITOR FOREST AND STREAM:—

To day has been something of a gala day for Princeton. The gymnastic contest of the class of '76 took place in the gymnasium this morning at 11:30. Prizes were offered for heavy weights, light weights, Indian clubs, and general excellence. The contest was very fine indeed. Messrs. Dunning and L. G. Walker distinguished themselves on the rings and parallels. Mr. L. M. Walker and Mr. Kaufman were particularly good on the horizontal bar and flying trapeze, at which latter Mr. Russell also succeeded admirably. The prizes were given as follows: Heavy weights, Mr. Frank Dunning, N. Y.; light weights, Mr. W. T. Kaufman, N. J.; Indian clubs, Mr. A. B. Turnure, N. Y.; general excellence, Mr. L. M. Walker, N. J. The judges were Messrs. A. Marquand, E.

Hall, and J. Dulles. At the close of the contest Mr. H. E. Davis, of Washington, on behalf of the class of '76, presented Mr. Goldie, the well-known gymnastic instructor, with a complete set of Appleton's Encyclopedia. Mr. Davis, in a brief speech, paid a deserved tribute to Mr. Goldie's popularity among the students as a gentleman of culture. Mr. Goldie thanked the class in a few hearty words. Dr. McCosh was called upon by some of the "boys," and made one of those laughable speeches of his, in which he also paid Mr. Goldie some high compliments. Among other things, he remarked that he valued Mr. Goldie's moral influence as highly as that of any professor in the college. After the speech the audience, which was large, dispersed. In the afternoon a game of ball was played on the college grounds between the University and a picked nine. The University played as follows: Denny, c.; Kaye, p.; J. Mann, 1st b; Furman, 2d b.; Woods, 3d b.; G. Mann, s. s.; Duffield, l. f.; Larkin, c. f.; H. Kaufman, r. f. The picked nine was vanquished by a score of 20 to 2. On Tuesday next the University play the Philadelphias, when Mann will pitch, Kay play first, Laughlin short, and Walker centre.

The University crew took a little spin in the afternoon. They are rowing as follows: Green '77, bow; Campbell '77, No. 2; Steward '78, No. 3; Stevenson '78, No. 4; Van Lenoep '76, No. 5; Nicoll '77, stroke and Captain. I am afraid boating interest is low in college. One does not hear the crew much talked about. They are a good crew, however, and are pulling well.

The spring meeting of the Princeton Athletic Club takes place next Saturday. The one mile walk promises to be very fine. LOUNGER.

CRICKET.

PHILADELPHIA, May 8th, 1876.

EDITOR FOREST AND STREAM:—

The return game between the Philadelphia and Germantown Cricket Clubs, on Saturday last, at the Germantown grounds resulted in a draw. The fielding all around was fair, the batting very fine, and the bowling bad enough. The Germantowns made the high score of 214. Tom Hargraves scored 66; H. W. Brown, 54; and John Large, 29 runs. The Philadelphias had no wickets down at 6 P. M., the time fixed for drawing stumps, for 87 runs.

The attendance at all the matches at these grounds is ample proof that the ladies take a deep interest in the play—or the players.

The game on next Saturday will be the Young America against, probably, the First Eleven of the Merion. SCULLS.

Yachting and Boating.

All communications from Secretaries and friends should be mailed no later than Monday in each week.

SCHUYKILL NOTES.

PHILADELPHIA, May 8, 1876.

EDITOR FOREST AND STREAM:—

The Crescent and Undine Boat Clubs will each hold a club regatta, on Saturday next, May 13th. The Crescents will have six-oared barges and four-oared, double sculls and single sculls.

The Undines will celebrate their 20th anniversary by six-oared barge and four-oared shell races, after which a steamer will take the members and invited guests to their new house, "Ringstetten," for an evenings enjoyment.

The Vesper Boat Club hold their annual club regatta on Saturday, June 3d.

The partisans of Saratoga do not rest entirely easy under the prospect of Philadelphia holding the great regatta of the season, and, although, owing to the general respect for the hearty hospitality of the Schuylkill Navy's invitation, and the assured numbers that will accept it, the opposition is not violent, nor exactly open.

They seem to entertain great fears that the climate of Philadelphia will interfere with training—a new discovery, if indeed it is a discovery at all, and not an invention. One advocate of Saratoga dreads the dust that will certainly fly here in August and September; but how the crews will manage to raise a dust on the river, unless the river should run dry, passeth understanding. The most reasonable objection they urge is to rowing races in heats. This is a point on which we willingly take issue, but we have no time to argue it now.

Besides the programme has been so fixed, and in all human probability will so remain, but if the colleges, or any other of the rowing associations that will assemble here insist upon a trial of their merits over a three mile course, straight away—wide enough to accommodate all the boats that can draw in line within hearing of a starter's pistol shot—the course can be had.

Nothing can be said in favor of Saratoga that can not be said of this course.

It is easy of access, presents excellent opportunities for twice ten thousand spectators. Can be kept clear of all obstruction, and is like the Saratoga course, as smooth as glass when the wind don't blow.

No course on which a large number of boats can start but is liable to this objection. SCULLS.

—The fleet of the College of New York, numbering thirty-eight boats, including five four-oared barges, manned by about one hundred and twenty students, started from Raynor's boat-house, Harlem bridge, at 9 A. M., on Saturday, under the command of Commodore E. Weed, of the class of '77, on the annual regatta. The course was up the Harlem River and through Spuyten Duyvil Creek to the Hudson, which they crossed and disembarked under the Palisades for dinner and athletic games, returning in the same manner. The display was very fine, and the regatta a success.

—The three mile race in open gunwale-rigged boats for $1,000 over the Charles River course between the Faulkner-Reagan and City Point Crews, which was to have taken place on the 5th inst., is postponed until the 19th.

GALLANT RESCUE.—An incident has been brought to our notice by our Philadelphia correspondent "Sculls," which should not be permitted to pass without a public commendation of the gallant fellows who were conspicuous for the part they played in it.

On the 20th of April, we believe it was, as the barge Undine of the Undine Barge Club was opposite Shawberry, the coxswain saw an accident of a distressing character. A carriage containing four persons was backed over the bank on the East side of the river at Laurel Hill. At the command the crew ran their boat to the scene of the accident, and Mr. A. L. Wilson, jumping into the water, succeeded in bringing two of the unfortunates, a mother and her son, to the boat, while the crew picked up a young lady, the daughter and sister of those already rescued. One young lady sank before the boat reached the spot and was drowned. The crew, although doing their duty, and what any crew would have done, certainly deserves a more than honorable mention. It consisted of Woodbury, coxswain; Allison, Madeira, Stille, Wilson, Hart and Jones.

THE NATIONAL ASSOCIATION.—The Executive Committee of the National Amateur Rowing Association met last Saturday at the Knickerbocker Cottage on Sixth avenue. The following members were present:—Chairman, A. F. Dexter, Narragansett Boat Club; E. R. Craft, Argonauta Rowing Association; Marcellus Bailey, Analostan Boat Club; G. W. Parker, Quaker City Boat Club; Alexander Krumbhaar, Philadelphia Barge Club; John E. Eustis, Atlanta Boat Club, and H. W. Garfield, of Albany, Secretary. The case of Mr. Gannon was gone into, and as not sufficient evidence was found to justify its being reopened, he remains suspended. After much discussion it was finally resolved that the Association should hold but one regatta this season, and that at Philadelphia. On motion of Mr. Parker the case of Riley, of the Neptunes, was reopened, and it was resolved that Riley was disqualified as an amateur. Mr. Craft then gave notice he would offer the following amendment to section 2 at the next meeting: "Any committee of this association having power to investigate the status of oarsmen entered for their regattas may require any club making an entry, to cause their president or secretary to declare upon his honor in writing that he believes the oarsman so entered is qualified to row under the association definition of an amateur; that he has been a member of said club for three months prior to the date of said regatta, and has not within that period entered or rowed in any regatta or race as a member of any other club (competition between members of the same club being excepted). In case such declaration be not furnished, then the oarsman entered by said club shall not be permitted to row in said regatta."

Messrs. Craft and Garfield were appointed a committee to report on the status of Thomas Fearon as an amateur.

—The freshmen at Columbia are now training on the Harlem. The crew is composed of H. Y. Cartner, bow; S. T. Eldridge, 2; C. H. Brown, 3; W. B. Parsons, Jr., 4; H. G. Hilton, 5; G. P. Seeley, stroke and captain. The average weight of the crew is about 146 pounds, and the average height is 5 feet 9½ inches.

—Thos. Fearon, the boat builder of Yonkers, will have on exhibition, at Philadelphia, a four-oared shell of the following dimensions:—Length, 40 feet 6 inches; width, 17 inches; depth, 7½ inches; weight, 75 pounds. It is built of Spanish cedar which is covered entirely with fine linen and a brilliant coating of varnish. There are a number of new ideas introduced in its construction which have been invented by Mr. Fearon, especially as regards the make of sliding seats, stretchers and out riggers. The steering apparatus is on an entirely new plan, and instead of the rudder being placed on brackets, as formerly, it is placed on a pivot on the deck and works like a beaver's tail.

FOREIGN AQUATICS.—Joseph H. Sadler and Edward Trickett, of Sydney, Australia, have signed articles of agreement to row a scullers' race from Putney to Mortlake on the 26th of June next. It is for £200 a side, and already the coming together of these men has created much interest in English aquatic circles. Sadler is almost as well known in America as in his own country, and, therefore, the reputation which he has achieved in the use of the oar needs no reference. Trickett has long been the acknowledged champion of Australia; he is twenty-five years old, six feet three and half inches high and weighs 210 pounds.

William Lumsden and Robert Bagnall rowed an open boat race on the Tyne, 11th inst., for £50 a side. The distance was half a mile, Lumsden winning easily by a length and a quarter. So soon as the race was over Bagnall's backers offered to again match him to row Lumsden. This was accepted, and the men will come together on the Tyne, May 9, for £100 a side.

THE ENCHANTRESS.—Mr. J. F. Loubat, owner of the American Yacht Enchantress, has written the following to the editor of *Bells Life*:

SIR—My attention has been called to some remarks which appeared in print some time since relating to the Enchantress having "turned up racing."

I beg leave to repeat the offer that I made through your columns August 15, 1874, that, if it should be agreeable to any member of an organized European yacht club owning a schooner yacht of at least 300 tons, R. T. Y. C. measurement, to sail a match for a one hundred guinea cup with the Enchantress over H. R. H. the Prince of Wales's Challenge Cup course, according to the rules and regulations and time allowance established for said course, I shall be most happy to sail such a match on any day after the 15th of August next, the race to take place on the appointed day without regard to wind or weather, and to be play or pay.

This offer remains open until the 15th of May next.

PARIS, April 12, 1876. J. F. LOUBAT.

Commenting on the above challenge the editor says: "Mr. Louhat's offer is couched in fair sportsmanlike terms, but unfortunately, through restricting the weight to 300 tons, there would be but the Boadicea, Elmina and Guinevere eligible to compete with the Enchantress. The Guinevere's past performances would, of course, cause her to be regarded as the English representative vessel, but now that she has dropped to the cruising class racing in her case is out of the question, and neither the Boadicea nor the Elmina is equipped for racing. There is Mr. Adrain Hope's new schooner, Fortuna, up to the size, but we have not seen ing to justify us in supposing that she is intended for other than a cruiser, and we are, therefore, afraid that, as in the case of Mr. Loubat's challenge of August, 1874, the present will be also allowed to pass by unnoticed by English yachtsmen."

THE LADY DUFFERIN.—The Cobourg *Star* says:—"The Lady Dufferin will soon be (as a nautical ball says) launched into her native element. On the stocks she is a beauty, and her figure the perfection of grace. Captain Cuthbert is the owner and builder, and he is backed by Major Gifford, who is always ready to push forward an enterprise. Of the chances of success in the coming contest it is impossible to calculate. Her model would seem to indicate that the requisites of speed and strength have been combined in the most satisfactory manner, but it will require one or two trials before it will be possible to judge how she will work on the ocean, or what conditions of wind and weather are the best suited to bring out her sailing qualities. We have confidence, however, that she will be no discredit to the Dominion." This is the yacht which has challenged for the American cup.

—The clipper ships for which America was famous twenty-five years ago, are again being put in competition with steam, on the long voyages of the Pacific. The steamers lose by being obliged to stop at the coaling stations while the ships keep on by the straightest course. Recently an American barque left San Francisco in company with a British steamer, for Japan, and reached her destination 24 hours ahead.

METAL SAIL BOATS.

NEWARK, N. J., April 28th, 1876.

EDITOR FOREST AND STREAM:—

We have frequently noticed in the columns of your valuable journal communications from Jacksonville, Fla., over the *nom de plume* of "Al Fresco." To say that "Al Fresco" was simply a good correspondent would hardly be giving him the justice he is entitled to, and having read his spirited letters to your paper for months past, I have come to the very natural conclusion that, like Saul among his brethren, "he stands head and shoulders above them all." In one of the "Al Fresco" letters which we had the pleasure of reading some weeks since, in giving some most excellent counsel to sportsmen and others traveling in the "Land of Flowers," he writes about a small sail boat, giving description as to size, etc., and further says the boat should be built of cedar. Why cedar, we are at some loss to know, for there are no waters on the coast of these United States in which that pest to wooden vessels, wooden docks, piling, etc.,—the *Teredo navalis*—are more abundant, and wooden boats of every kind that are used in the salt and brackish waters of Florida are riddled with them in a couple of seasons, so as to become almost as leaky as a sieve—in fact, ruined for practical purposes, except they are pulled on shore when not in use. As land is not the proper element for boats, the handling they receive, with the climatic influences they are under while high and dry, are not beneficial to them in any way, but just the reverse. Under such circumstances why not use boats in these Florida waters made of a material other than wood? Metal of some kind, zinc, galvanized iron, or something of the sort? We feel well assured that metal boats could be made as smart, safe and comfortable as similar small size boats made from wood, and in addition, boats properly made of metal would be quite as light in draft, and possibly draw less water than boats of same size made of wood.

Small vessels of this kind, made by some practical boat-builder like Holmes, Shaw & Brown, of Bordentown, this State, would in our opinion be a great success for the shallow bays and streams of the Florida coasts and inland waters. We can safely say from our own experience that metal boats built on the same plans and models of the sailing skiffs of the shallow waters of the Upper Delaware River, and in constant use at Burlington, Bristol, Beverly, Bordentown, etc., would be fully equal to all the wants of the tourist and sportsman in speed, safety, comfort and light draft, while voyaging through the Florida waters, and give them the complete satisfaction that would be exceedingly difficult to get in any other class of small vessels.

We are somewhat surprised that in this "iron age" some metal boat builder has not given the sporting world something in the way of a small light draft, and safe sail boat that would merit their approval, and true the time is not far off when the metal sail boats of many northern sportsmen will be doing the waters, coastwise and inland, of the State of Florida. RIP RAP.

VIRGINIA RIDING CLUBS.—A correspondent who has contributed many articles to our columns relating to sport in Virginia, sends the following memoranda: It will be seen, if his statements are sweeping, that the long time tournaments have given place to steeple chases and fox hunting. These facts are interesting in view of the growing interest in these sports in the North and West:

"In Fauquier County, Va., last year was organized a riding club, composed of the wealthy young men, splendidly mounted. They have different kinds of races in the summer that attract visitors from a hundred miles around. Yesterday I saw at Galt's, in Washington city, a "punch bowl" costing $250, as first prize for the best rider in the hurdle race, to be run next summer under the auspices of this club. At the time set for the racing, or the meet, every man is attired in a fancy dress—brilliant in color and serviceable in wear—and every one is splendidly mounted, and this has entirely superseded the childish tournament. There is a large riding club in Richmond, two or three in the Valley, and more are organizing, and doubtless this summer will witness their introduction into the Northern States. These clubs are identical with those in Great Britain, and are the certain consequence of a love of blooded horses. The various agricultural fairs in the State have made all perceive the advantages in blooded the stock, and having fine horses tends to form these clubs."

—Findley's Lake, situated in the western part of Chautauqua county, N. Y., one hour's drive from northeast Pennsylvania, on Lake Shore & Mich. Southern, Railroad and about the same from Sherman, on the Buffalo, Corry & Pittsburgh Railroad, is a beautiful lake three miles long, well stocked with fish, such as black bass, rock bass, sun fish, perch, bull heads, etc. Mr. R. A. Corbett, proprietor of the hotel there, put 30,000 salmon trout in the lake last winter. In the spring and fall there is good duck, snipe and woodcock shooting. The woods are well filled with partridges and squirrels. Board can be had from $5 to $8 per week. Mr. Corbett has a fine steam yacht in connection with the house, also plenty of row-boats for his guests. There are good roads and pleasant drives.

DESCRIPTIVE GUIDE TO THE

ADIRONDACKS,

AND HAND BOOK OF TRAVEL

Saratoga Springs, Schroon Lake, Lakes Luzerne, George, and Champlain, the Ausable Chasm, the Thousand Islands, Massena Springs, and Trenton Falls.

By E. R. WALLACE,

Newly Revised Edition.

Handsome 12mo., Flexible Covers, Red and Gold, Maps, etc. Beautifully illustrated. Over 300 pages. Price, $2.

TESTIMONIALS.

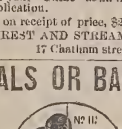
From Hon. J. T. Headley, the Historian, Author of "Adirondack, or Life in the Woods," &c.

"It is admirably written, and has just enough of incident, sentiment, and description of scenery mixed, to make it delightful. The illustrations are well chosen and very effective, while the instructions respecting guides, localities, distances, outfits, &c., embrace everything that can be desired. Taking it all in all, it is the most complete book that has been published on the Adirondacks, not excepting even my own—a compliment that I trust will be properly appreciated as an extraordinary disinterestedness."

From Albert B. Street, the Poet, and Author of "Forests and Waters," "The Indian Pass," &c.

"I think it is the *best* work on the forest that has appeared—superior in word-painting to Murray's, and of wood pictures and vivid scenes of camp-life, realize that we are in the forest, are living with in the scenes described, and that the trees are ing and the waters flowing over and by us. This, ak, the true test of a good book, impressing its ty and distinctive life on the mind. As an "Guide," it is most creditable and valuable. Indeed, it *the only* thing of the kind that has yet been published—the very thing that has been so long wanted wished for. It must have cost you intense application and labor. You may well be content that you produced a good book.

From Benson J. Lossing, the Historian.



have read those portions descriptive of the places it came under my personal observation, with the most interest, and most cheerfully testify to the ood accuracy of your pictures as I recall impressions made of them at the dates of my visits. I tee your "Descriptive Guide" and the "Appendix" most useful—nay, indispensable, manual for tourto that wonderful Wilderness. A tour in that on is eminently a practical matter, and for that son I regard your "Guide" as an important, useful, timely publication.

FOR SALE, OR TO LET.

The elegant country residence, WILLOW LAKE, at Locust Valley, near Glen Cove, Long Island.

Suitable for Summer Boarding-House.

The house is 2½ stories, frame, 40 feet front and 32 feet deep, with wide piazza front, rear, and on south end. On first floor are parlors, sitting-room, and dining-room; wide hall through the centre. Up stairs are 9 bed-rooms, all large and airy; kitchen well-arranged and convenient; cellar large and dry.

On the premises, and at a convenient distance from the house, are a stable and carriage house, chicken-house, shed, coal, tool, and ice houses. The grounds are well laid out and tastefully planted with ornamental trees and shrubbery. The approach leading from the road to the house skirts a beautiful lake, on the border of which the house stands. A Paper Mill at the north end of the lake will be sold with the above, subject to a lease. The lake and land embrace about 27 acres. As a place of residence it is elegant and healthy; for manufacturers it is convenient; for the propagation of trout, for pleasure or profit, there is no better place in the State. Apply to

THE "FISHING LINE."

Brook Trout and Grayling Fisheries

OF NORTHERN MICHIGAN, VIA

Grand Rapids and Indiana Railroad.

(Mackinaw, Grand Rapids & Cincinnati Short Line.)

The waters of the Grand Traverse Region and the Michigan North Woods are unsurpassed, if equalled, in the great abundance and variety of fish contained.

Brook Trout abound in the streams, and the famous American Grayling is found only in these waters.

Brook Trout Season opens May 1st.

Grayling Season opens June 1st.

Black Bass, Pike, Pickerel, and Muscolonge are also found in large numbers in the many lakes and lakelets of this territory. The sportsman can readily send trophies of his skill to his friends or "Club" at home, as fee for packing fish can be had at many points.

Take your family with you. The scenery of the North Woods and lakes is very beautiful. The air is pure, dry, and bracing. The climate peculiarly beneficial to those suffering with hay fever and asthma.

The Hotel Accommodations, while plain, are, as a rule, good, far surpassing the average in countries new enough to afford the finest of fishing.

On and after June 1st Round Trip Excursion Tickets sold to Points in Grand Traverse Region, and attractive train facilities offered to tourists and sportsmen; also on and after July 1st Mackinaw and Lake Superior Excursion Tickets.

Dogs, Guns, and Fishing Tackle Carried Free at owner's risk

Camp Cars for Fishing Parties and Families at low rates.

It is our aim to make sportsmen feel "at home" on this route. For Tourist's Guide, containing full information as to Hotels, Boats, Guides, &c., and accurate maps of the Fishing Grounds, send to Forest and Stream office, or address

THE SPORTSMEN'S ROUTE.

Chicago & Northwestern Railway.

This great corporation now owns and operates over two thousand miles of road, radiating from Chicago. Like the fingers in a man's hand, its lines reach in all directions, and every about all the country north, northwest, and west of Chicago. With one branch it reaches Racine, Kenosha, Milwaukee, and the country north thereof; with another line it pushes through Janesville, Watertown, Oshkosh, Fond du Lac, Green Bay, Escanaba, to Negaunee and Marquette; with another line it passes through Madison, Elroy, and for St. Paul and Minneapolis; branching westward from Elroy, it runs to and through Winona, Owatonna, St. Peter, Mankato, New Ulm, and Tracy; cops out until Lake Kameska, Dakota, is reached; another line starts from Chicago and runs through Elgin and Rockford to Freeport, and, are the Illinois Central, reaches Warren, Galena and Dubuque, and a country beyond. Still another line runs almost due westward, and passes through Dixon, Sterling, Fulton, Clinton (Iowa), Cedar Rapids, Marshalltown, Grand Junction, to Council Bluffs and Omaha. This last named is the "GREAT TRANS-CONTINENTAL ROUTE," and the pioneer overland line for Nebraska, Colorado, Utah, Idaho, Montana, Nevada, California, and the Pacific Coast. It runs through the Garden of Illinois and Iowa, and is the safest, shortest, and best route in Omaha, Lincoln, and other points in Nebraska, and for Cheyenne, Denver, Salt Lake City, Virginia City, Carson, Sacramento, San Francisco, and all other points west of the Missouri River.

TO SPORTSMEN:

THIS LINE PRESENTS PECULIAR ADVANTAGES—FOR PRAIRIE CHICKEN, DUCK, GEESE, AND BRANT SHOOTING. THE IOWA LINE TO-DAY OFFERS MORE FAVORABLE POINTS than any other road in the country, while for Deer and Bear Hunting, and for Brook Trout, Lake Salmon, Pike, Pickerel, and Bass Fishing a hundred points on the Northern and Northwestern lines of this company will be found unsurpassed by any in the West.

MARVIN HUGHITT, W. H. STENNETT,
Gen. Supt., Chicago. Gen. Pass. Agt., Chicago.
ap16

TO SPORTSMEN:

THE PENNSYLVANIA R. R. COMP'Y

Respectfully invite attention to the

Superior Facilities

afforded by their lines for reaching most of the TROTTING PARKS and RACE COURSES in the Middle States. These lines being CONTINUOUS FROM ALL IMPORTANT POINTS, avoid the difficulties and dangers of reshipment, while the excellent cars run over the smooth steel tracks enable STOCK TO BE TRANSPORTED without failure or injury.

The lines of

The Pennsylvania Railroad Company

also reach the best localities for

GUNNING AND FISHING

in Pennsylvania and New Jersey. EXCURSION TICKETS are sold at the offices of the Company in all the principal cities to KANE, RENOVA, BEDFORD, CRESSON, RALSTON, MINNEQUA, and other well-known centers for

Trout Fishing, Wing Shooting, and Still Hunting,

Also, to

TUCKERTON, BEECH HAVEN, CAPE MAY, SQUAN, and points on the NEW JERSEY COAST renowned for SALT WATER SPORT AFTER FIN AND FEATHER.

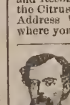
BUY IT Vanity Fair.
It is shaved from the best Natural Leaf, for Meerschaum and Cigarettes. Does not make the tongue sore. Sample on receipt of 20 cents. Highest award, Vienna, 1873. Send for circular. WM. S. KIMBALL & CO.,
PEERLESS TOBACCO WORKS, Rochester, N. Y.

From Seth Green, Supt. N. Y. State Fisheries.
I find Vanity Fair to be the best article of tobacco adapted to the wants of the sportsman. Have used your tobaccos for many years, and know them all to be first class.

For Sportsmen.
A trusty friend, in weariness or trouble; a solid resource in Winter and rough weather, is a sweet pipe with Vanity Fair. Best dealers have it.



From A. B. Lamberton, Rochester.
Having smoked your tobacco, Vanity Fair, by the camp fire and by the hearth, I believe it in point of fragrance and taste superior to all brands known to me. Being in search of a tobacco that would not fire the tongue and mouth, I was made acquainted with your Vanity Fair, and found it to be the *ne plus ultra* of natural leaf.

For Cigarettes.
A cigarette is an interlude to the serious habit; a graceful make-believe for spare hours. For cigarettes Vanity Fair has no equal. Best dealers have it.

From Forest and Stream, N. Y.
We have received from Messrs. Kimball & Co., of Rochester, some choice specimens of their celebrated Vanity Fair tobacco in neat metal cases holding a pound each; and, after most thorough trial, do not hesitate to concede to it all the good qualities which its manufacturers claim for it. It is a most superior article, and a great comfort to discriminating smokers.

THE
PAPER STEM PIPE.
Just the Thing for Home and Camp Use.
Supplies a want which smokers have long felt—a pipe which shall give simply the taste and odor of tobacco smoke. This pipe never accumulates rank smelling liquid in stem or bowl, but is always clean and sweet. The bowl and mouthpiece are permanent, but the stem is of porous paper, to be laid aside after a few days' use and a new one fitted. Extra stems accompany each pipe. The price of extra stems, when not furnished with the pipe, is as follows: Four and a half and seven inches, 5c.; twelve inches, 15c. Sold by pipe and cigar dealers generally, or a complete sample sent by mail for $1 by

GUNPOWDER.
Dupont's
SPORTING, SHIPPING AND MINING
POWDER.
DUPONT'S GUNPOWDER MILLS
(ESTABLISHED IN 1801),
Have maintained their great reputation for 75 years. Manufacture the Celebrated
EAGLE DUCKING, EAGLE RIFLE, AND DIAMOND GRAIN POWDER.
The most Popular Powder in Use. Also,
Sporting, Mining, Shipping and Blasting Powder
Of all kinds and descriptions.
For sale in all parts of the country. Represented by
F. L. Kneeland,
Feb 10-1y 70 Wall Street, New York.

The Hazard Powder Co.,
MANUFACTURERS OF
Gunpowder.
Hazard's "Electric" Powder.
Nos. 1 (fine) to 5 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. *only.*

Hazard's "American Sporting."
Nos. 1 (fine) to 3 (coarse). In 1 lb. canisters and 6¼ lb. kegs. A fine grain, quick and clean, for upland and prairie shooting. Well adapted to short guns.

Hazard's "Duck Shooting."
Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6¼ and 12½ lb. kegs. Burns *slowly* and very clean, shooting remarkably close, and with *great penetration.* For field, forest and water shooting it ranks any other brand, and it is equally serviceable for muzzle or breech loader.

Hazard's "Kentucky Rifle."
FFFG, FFG, and "Sea Shooting" FG, in kegs of 25 12½, and 6¼ lbs, and cans of 5 lbs. FFFG is also packed in 1 and ½ lb. canisters. Burns strong and *moist.* The FFFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard *Rifle* powder of the country.

SUPERIOR MINING AND BLASTING POWDER.
GOVERNMENT CANNON AND MUSKET POWDER; ALSO SPECIAL GRADES FOR EXPORT, OF ANY REQUIRED GRAIN OR PROOF MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's agents in every prominent city, or wholesale at our office.
88 Wall Street, New York.

Bound Volumes
OF
Forest and Stream.

Orange Sporting Powder.
ORANGE LIGHTNING POWDER,
The *strongest* and *cleanest* Powder made. Nos. 1 to 7, packed *only* in sealed 1 lb. canisters. The coarser sizes (higher numbers) especially are recommended to owners of fine breech-loading guns, giving great penetration with very slight recoil.
ORANGE DUCKING POWDER,
For water fowl. Very strong and clean. Nos. 1 to 5. Packed in metal kegs of 6¼ lbs. each, and in canisters of 1 and 5 lbs.
ORANGE RIFLE POWDER,
The best for rifles and for all ordinary purposes. Sizes F.g, FF.g, FFF.g, the last being the finest. Packed in wood and metal kegs of 25 lbs., 12½ lbs., and 6¼ lbs., and in canisters of 1 lb. and ½ lb.
All of the above give high velocities and less restraint than any other brands made.
BLASTING, MINING, AND SHIPPING POWDER OF ALL GRADES AND SIZES PACKED IN WOOD OR METAL KEGS OF 25 LBS.
SAFETY FUSE AND ELECTRICAL BLASTING APPARATUS.
LAFLIN & RAND POWDER Co.,
26 Murray St., N. Y.
Sole proprietors and manufacturers of the celebrated ORANGE brand of GUNPOWDER. Recommended and used by Capt. A. H. BOGARDUS, the "Champion Wing Shot of the World."

CHALLENGE.
The undersigned is prepared to prove all the superior qualities he claims for his powder.
Safety, Cleanliness, Strength, Little Recoil, Little Smoke, Small Report, Less Heating of the Barrel in Rapid Firing, and its Regularity in Shooting.
He challenges all riflemen to shoot against him with black powder, 200 rounds, without wiping; 100 rounds off-hand, at 200, 500 and 1,000 yards respectively, and 100 rounds in any position at same distances; the 300 rounds equally divided at the three ranges; sighting shots extra.
Will shoot for money if desired.
The powder is also well adapted for shot guns.

THE NEW

BOSTON

SHOOTING SUIT,

Manufactured only by

G. W. SIMMONS & SON,

Boston, Mass.

We offer this season an entirely new design of WATER-PROOF SHOOTING SUIT (made from extra quality duck), in the preparation of which we have been assisted by the advice and suggestions of our best resident sportsmen.

The design embraces the best points of the English and French Suits, combined with the necessary requirements for American service. Particular attention has been paid to color.

Each suit is thoroughly water-proofed by a new patent process. The seams and pocket corners being securely fastened, the arm holes ventilated, and nothing neglected to render the suit perfect in every respect.

The price has been fixed at $13, to include Hat or Double Visored Cap, Detachable Haversack, Coat, Vest, and Pantaloons.

One hundred suits will be kept ready in stock, so that we can furnish to order any size required, at a moment's notice.

In the *Golden Rule* (Rev. W. H. H. Murray's paper) the enthusiastic editor writes:—

"We were shown, the other day, a new water-proof suit, specially adapted for sportsmen, designed and made up by Simmons & Son, of Boston, and in which we can the attention of all brethren of the out-door and shore-shooting fraternity, because it meets the demand of personal comfort and convenience beyond anything of home manufacture seen by us before. As a sportsman, we give it our unqualified endorsement, as combining the best points of the English suits, and in addition skilfully adapted to the necessities of the American service. It is a most admirable and satisfactory contrivance in color, style, water-proof quality and capacity. The coat is a marvel in this latter respect."

Persons ordering from a distance need send only the following to be sure of a perfect fit:—Waist Measure, Height, Breast Measure, Length of Sleeve, Size of Head.

No. 3.—Same as No. 2, 22 cal.; 24 in., $30.00; 26 in., $31.50; 28 in., $33 00; 30 in..... 34.50

No. 4.—Octagon barrel, extra heavy case-hardened frame, first class in every respect, fully warranted, 38, 40, 44, 45, and 50 cal.; 26 in., $32.00; 28 in., $34.00; 30 in., $36 00; 32 in., $38.00; 34 in..... 40.00

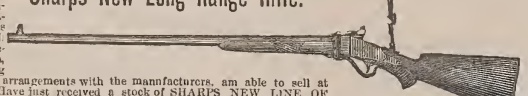
No. 5.—"Pacific," same as No. 4, double set triggers, cleaning rod under the barrel; 28 in., $40.00, 30 in., 42.00

No. 6.—"Off-Hand," 40 and 44 cal., 30 and 32 inch barrel, hand-made stock, German style, extra fine registering sights, double set triggers..... 75.00

No. 7.—"Creedmoor A1," to 1,000 yards, 44 cal., to 110 grains, selected hand-made pistol grip stock, finest Vernier and wind gauge sights, with spirit level, sight case, finest finish..... 100.00

No. 8.—"Creedmoor," same as A1, but not so highly finished..... 85.00

No. 9.—"Creedmoor," without pistol grip..... 75.00



Address

SCHOVERLING & DALY,

[P. O. Box 5380.] 84 and 86 Chambers St., New York.

I have now in stock a complete assortment of Rifles of all well known and reliable makers, and having made special arrangements with the manufacturers, am able to sell at their prices. Have just received a stock of SHARPS NEW LINE OF LONG RANGE AND OFF-HAND RIFLES. Riflemen are invited to call and examine. They will be cheerfully shown to all who take an interest in Rifle Shooting. REMINGTON, BALLARD, WESSON, AND STEVENS RIFLES, all lengths and calibre. Every Rifle purchased can be tested in the 100 yard range on the premises. Liberal arrangements made with rifle and associations. Send for illustrated circular. HOMER FISHER, 260 Broadway, corner Warren St., N. Y.

Sharps New Long Range Rifle.

Paper and Metallic Shells

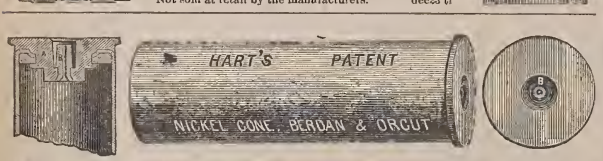
FOR

Breech Loading Shot Guns,

Manufactured by the

UNION METALLIC CARTRIDGE CO.,

BRIDGEPORT, CONN.



THE STURTEVANT SHELLS are the easiest reloaded. Do not have to unscrew the head nor use an awl to remove the exploded caps. THE PATENT MOVABLE ANVILS, made of steel wire, will not bend or break.

THE BERDAN PATENT SHELLS, new model, with Hobbs' patent waterproof primers, never miss fire, and are highly prized by all that have used them.

PAPER SHELLS.—By repeated experiments and great outlay for improved materials, and machinery made expressly for the purpose, we can now warrant our BROWN PAPER SHELLS equal to any imported. They are sure fire, and will not burst in the gun.

Inquire of any of the dealers in sporting materials for the U. M. C. Co.'s Shells.

Not sold at retail by the manufacturers. dec23 tf

Hart's Sportsman's Favorite Metallic Shells for Breech Loading Shot Guns.

These Shells are easily loaded, and the caps easily extracted from inside. Head solid, and much thicker than any shell now made, giving a solid seat for cone or anvil, which prevents it from driving through or springing away, thereby causing misfires. The cone is made of nickle and fastened solid in its place. It neither rusts or corrodes fast like moveable anvil made of steel. The nickle cone also prevents misfire when cap has been left on shell for a few days, which is liable to occur either in steel or iron. These shells are finely finished, and made any length ordered, from 2¼ to 3½ inches.

Shells and Loaders, and description Price Lists, can be obtained from all the leading sportsmen's houses throughout the country. GEO. E. HART & CO., 363 and 365 Market st., Newark, N. J.

From Captain Bogardus, Champion Wing Shot of America.

MESSRS. GEORGE E. HART & CO.,

Gentlemen—The fifty shells I received from you to-day suit me better than any I have ever used. They are stronger and better in every respect, and I shall use them in all my shooting hereafter. Yours truly,

may18-1y A. H. BOGARDUS.

Camp Life in Florida.

By CHARLES HALLOCK,

AUTHOR OF THE FISHING TOURIST.

This is a most seasonable book for Sportsmen, Tourists, Invalids, and Settlers, and has been long needed by Winter tourists to Florida and persons seeking settlement there. It gives a full classification of the game and fish of the Southern Peninsula, routes of interior and coastwise travel, the agricultural resources of the country, and sites for settlement, hints for camping out, resorts for game, hotels, and such other information as will be of great benefit to visitors seeking Florida for health, pleasure, exploration, or permanent settlement.

318 pp., 12mo. Price, $1 50.

CONTENTS:

Introductory Chapter.
Birds-eye Glance at Florida.
Outfit for Sportsmen.
Hints for Southern Hunting.
Coastwise Route of Travel.
Game Animals and Birds of Florida.
Game Fish of Florida.
Three Months in Florida for One Hundred Dollars.
Supplementary Hints for Cheap Recreation.
Up the St. John River.
Indian River.
Florida the Promised Land.
Fort Capron.
Fishing at St. Augustine.
Black Bass Fishing on Spruce Creek.
Hunting the Panther.
The Environs of Tallahassee.
Private Dougherty and the Bass.
Pet Birds of St. Augustine.
Steam Yachting on the St. John.
Among the Seminoles.
In the Cypress Swamps.
Cruising Along Shore.
Shooting at Salt Lake.
The Okeechobee Expedition.

SOUTHWEST FLORIDA.

Angling in Nova Scotia.

"Fancy ne'er painted to the sons of song
Scenes to which more of nature's charms belong."
—*Nova Scotia's poet statesman, Howe.*

At the southern end of the peninsula of Nova Scotia there is a locality abounding in fine trout streams but little known to our anglers. Having seen mention in your paper of the Tusket River as the best for trout in the United States, I determined last May to visit the land of the Mayflower. Leaving Boston at noon on Tuesday by the steamer Dominion, we reached Yarmouth on the following day about 4 P. M. It is a town of 8,000 inhabitants, has five school-houses, and some beautiful private residences. The Customs officers were obliging, and passed all our traps without delay and formalities. Thursday was spent in buying supplies, the numerous groceries having an excellent variety, and in seeking information about the fishing grounds. A map of the county of Yarmouth showed a large area of lakes scattered over its surface, and the Tusket divided into numerous branches forming an intricate net work of rivers. The main river flows into the salt water at Tusket, nine miles from Yarmouth, and through its whole extent trout were said to be plenty. Salmon trout and salmon enter the river as early as April, and can be taken with the fly in May and June. The angler's main dependence there is the common brown or brook trout, which we were told were most abundant near the headwaters. Learning that Kemptville was the best point for departure on the river, everything was put in readiness for an early start next morning. My canoe was securely strapped on an express wagon, with tent and luggage snugly stowed inside. Friday morning we were off for Kempt. The birds were singing gaily in the sunshine, the roads good, and as a fine roadster from one of the livery stables bowled us along rapidly, the driver remarked that everything was "hunky." The route we took was *via* Tusket—the longest, but the charming bits of scenery we met with made it all the better for the greater distance. After passing through the beautiful village of Tusket, the way lies through the forest, not only of "the murmuring pines and the hemlocks," but of many other deciduous and evergreen trees which grow side by side and mingle their foliage in pleasing variety. The road affords frequent views of lakes and river, and often was I tempted to stop and try some of those inviting casts where every angler "knows there must be good fish." We reached Prosser's, our destination, at noon, found they had word of our coming and dinner ready. Mr. and Mrs. P. assisted at serving, and the honest old fellow's humor and the banter of his wife were highly amusing. This worthy pair are an interesting study. The writer can only say that the sportsman can nowhere find more hospitable, kindly people than they. Then, sitting on the kitchen doorstep, I took in with the smoke from my pipe the noble view it commands. In front, the broad expanse of Pearl's Lake sparkled in the sunshine, and beyond, scintillating like a star, the far-off Silver Lake lay half hidden in the forest, whose extreme hills seemed to support a mass of glorious summer clouds. To the right, a fine growth of hard wood encircled the lake, concealing the exit of the river, which on the left, winding through the distant meadows, beneath a long bridge, ran swiftly in.

Eager for sport, I questioned Mr. Prosser as to the nearest fishing, and he induced a neighboring shoemaker to take me down the lake in a punt to the first rapids on the river, about half a mile away. Rounding a point we found the river, rejoicing to be free from the confinement of the lake, hurrying on its way to leap and play around the rocks and bars below. Straight away it ran down a gradual descent, until divided by an island, it seemed lost in the trees for a time, producing a beautiful effect. These rapids are called Eel-Weir, and have often furnished good sport to local anglers. This day the trout were not rising well, but perseverance put a lining of spots in my basket before we returned at night. After dark several parties of young fellows arrived from town to spend the next Monday, a public holiday, on the river. With the dawn of Monday all were making ready to set out. I had decided to go up a branch called the Little River, and my canoe and dunnage had been transported to a point above the dam of the gang mill, about three miles from Prosser's. A party going in the same direction found room for me in their wagon, and I was soon at the mill looking for the guide engaged for me, who was to be an old man with a pipe in his mouth, and to answer to the name of Gray. In a few minutes there came along a path on the opposite bank a tall, muscular old fellow, with keen eyes and Wellingtonian features, pulling a short pipe. Hailing me he stepped into the canoe, poled her across, and shortly we had everything stowed. Each taking a paddle away we went up stream. A hail from some lumbermen of "had a smoke yet, Gray?" brought out some samples of the old man's dry humor.

My canoe was of light wood, broad on the bottom, with a skin of waterproof varnished canvas. In fishing I stood in the bow, and could make casts with ease and safety in any kind of water. A properly made canoe is better than any boat for river fishing. It can go in very shallow water, through narrow passages, can be lifted over or carried around obstructions, propelled easily and swiftly, and in rapids, with proper handling, is safer than a boat of any kind. A canoe trip, even without fishing, is delightful; there is no better exercise than paddling, you see where you are going, and get no twists in your neck. Given blue sky and sunshine, it is great enjoyment to light your pipe after a good dinner, stretch out on your back in a canoe, watch the smoke, look at the sky, have somebody else paddling vigorously against a light breeze, listen to the music of the water, and feel the poetry of motion as the canoe dances and rocks over the ripples. Gray was a good canoeman from long practice; he guided mine with remarkable skill in the rapids, and in his own words, could "shove her anywhere she'd live." After passing through a few miles of still water, we stopped to fish an old mill brook and the Island Falls, then keeping on and fishing each rapid, by noon we reached the foot of the Long Falls, ten miles up, and stopped for dinner. There I learned how delicious is a freshly caught trout, well broiled over a wood fire. To our great annoyance it was discovered that a bag containing the most of the tinware and camp utensils, which Gray called the "trumpery," had been left at the mill. We had to go back for it, and had only got three miles above the mill again when it grew dark, and we camped for the night.

The next day we pushed on rapidly, taking few trout, as natural flies swarmed on the water, and we wished to make up for lost time. Towards noon they rose well, and at the foot of Dave's Falls I caught two brace of pound trout in succession, and lost a leader by a third. By night we had made good progress, and camped at the Upper Long Falls. Gray pointed out to me a meadow where he once shot two moose, and showed me fresh bear signs near the camp. Muskrats showed themselves often in the water; we saw many sticks which had been gnawed by beavers, and moose tracks in the woods. A large firkin had been brought, in which to pack the surplus trout, and Gray, in view of my unskillfulness and the small catch, dryly suggested that we leave it until our return, "as it took up so much room." This wasn't to be thought of, and the following day I had the satisfaction of seeing thirty-two heavy trout cleaned and deposited in the bottom thereof. Wednesday we came to the Little Branch, went up it a short distance, but finding the water very low, dropped down and continued on our way. Thursday morning we reached the Big Bad Falls, at the foot of which was splendid fishing. Here in an hour I caught thirty-eight game trout, averaging full a pound in weight, and lost as many more. These rapids were nearly a mile in length, and as to proceed we would have had to carry around them, we decided to turn back. At noon I enjoyed seeing fifty good trout added to the contents of the firkin, which was filled the next day. Friday evening we got back to Prosser's without accident or mishap of any kind. We had gone up about twenty-five miles—farther than any fly-fishermen, save one, had ever been before, and the farther the better seemed the fish and the fishing. The Little R. is not remarkable for scenery, but is in general pleasing. Its average width is twenty yards, and is easily navigable for boats. The trout are of good size and very abundant. My own catch was not large, but as my time was divided between rod and paddle, and my fishing more enthusiastic than expert, I think a skilled angler, with a fair chance, could take more fish than he would know what to do with. I learned at Kempt that two N. H. gentlemen had recently returned from a five days' trip up the main river, with over five hundred trout, having, they said, never had better sport.

Saturday passed in preparing for a long canoe trip. This was to descend the Tusket and carry from one of its lakes into Bloody Brook branch of the Clyde, to go down B. B. and Clyde to the sea, thence by team to Barrington, and ascend the Barrington River to its source in Great Pubuico Lake, and there get conveyance by land to Yarmouth. I had engaged a Canadian half-breed, by name Jerry Bartlett, a tall, sinewy young fellow, full of Indian cunning, French mirthfulness, and Yankee slang, who proved, to use his favorite expression, "a good general" guide. Though I expected to do little fishing, having only eight days in which to make the round trip of about one hundred and twenty miles, I had hopes of getting a salmon in the Tusket or Clyde. Leaving Kempt on Monday morning, our light craft skimmed like a bird over the lake, and entering the river raced with the current down rapid after rapid, through little lakes and runs, between banks clothed with green foliage, until at noon we stopped at the Bad Falls, the worst on the river. These we could not run with safety, so made a portage to the still water below. While Jerry was cooking dinner I waded into the stream and tried for salmon. After wielding a heavy rod half an hour, with only a few trout for my pains, I despaired of a rise from larger fish, and carefully trailing my line down stream, I stood gazing at the falls above. Glancing at my fly, I was astonished to see the silvery sides of a salmon, bent like a bow, rising out of the water. A moment later I felt the line running off the reel and raised my rod to strike, but too late! the fish had let go. After dinner I tried again and again all the pools and eddies, but with no success. I have since framed many excuses for the loss of that, my first salmon, and justified my delay in striking by citations of excellent authorities, but the truth is I was so disconcerted by the unexpected rise that I failed to strike with that deliberate promptitude which is requisite in salmon fishing.

We reached the Forks at sunset and camped near the bridges. A branch enters the main river at this point, whence the name given to the settlement which is entirely French. We had this day passed through a beautiful country and fine fishing grounds, often tempting us to tarry by the way; yet we were told that the portion of river between the Forks and Tusket Falls was more attractive than that above. A favorite trip with Yarmouth anglers is to descend the river from Kempt to Reynard's Bridge, a mile above Tusket. Our plans obliged us to leave the main river here and ascend the branch, which we did the next day. After working through some troublesome rapids we entered on a long, wearisome stretch of still water, which wound for miles through dreary barrens. In the middle of the day we got to the long, bad rapids at Hurlburt's Mill, and made a portage to the stream above. In the evergreen forest again, we paddled on, and late in the afternoon entered Great Barren Lake, singularly misnamed. It is a noble sheet of water, three miles long, dotted with numerous picturesque islands which, with the shores, were finely wooded. Huge granite rocks lifted themselves high out of the water, as if guarding the entrance, and from one of these, called Molsoa's, the Indians have a tradition that a squaw once shot a fatal arrow at a moose on an island fifty yards away. Skirting the shore, we startled a wild duck with her young brood, as they were feeding on the water. The cunning old bird sought to draw our attention from the young while they hid on the

bank, by counterfeiting a cripple, and keeping on the water a short distauce ahead until we had gone on some hundred yards, when she dashed into the air and winged her way back over our heads. By a very narrow, deep, and rocky stream, teuanted by large gamy trout, of which I took some samples, we entered Gull Lake, which, though out of our course, proved well worth a visit. It is circular in form, a mile in diameter, and environed with forests. In the centre is a curious group of rocks, the nesting-place of gulls, which, high above us, shrieked their alarm at our intrusion. Inflamed by the prospect of eggs for supper, we made for the rocks, found eggs, but alas! the abodes of life. Returning to Barreu L., we pitched our tent on one of its charming islands. Next morning, through Stony Creek and the Stony L. beyond, we reached the English Mill, or rather the stream which bears its name, nothing being left of the mill but some old timbers. This streau is deserving of its local repute, for it seemed full of trout. Through the clear water we saw them darting about on the bottom, and they broke the water all around us after natural flies. The big fellows were flopping about in such a way that I staid an hour casting over them, but indneed very few to take my flies, they seeming to prefer a less metallic diet. This stream connects two large lakes, usually a favorite situatiou for trout. Another portage to get around the dam, aud we were on Meadow Lake, which is similar to Barren. Paddling through this and into a little creek as far as we could go, two miles of woods lay between us and Bloody Brook. This portage was made in two trips during the afternoon, and we had embarked and paddled down a lake before uightfall. The lugging was very wearisome in a still air and under a hot sun, but the sweat that flowed from us in consequence was an effectual eulexiuge for the black flies. (We afterwards got out of "fly oil," aad found a mixture of Johnson's liniment and castor oil a good substitute). None but lumbermen and Indians had ever been through there before, and probably few, if any, of my readers will care to repeat the trip.

The Bloody Brook is a beautiful stream, about the size of the Little River at Kempt. Silvery white birches line the banks, and green meadows stretch away on either side. It is deep and clear, with a bottom of clean, coarse sand and gravel, the best of spawuing ground for salmon. Half way down we found a young moose, dead and floating in the water. We conjectured that it had been driven in and drowned by one of the old bull moose. Through a few miles of rapids and ten of still water we reached the Clyde, aud over the placid surface of this noble river we paddled four miles through an open farming country, affording extended and pleasing views, reaching at sunset the Victoria Falls, whose roar we heard half a mile away. We had been told by a farmer above that we could not run these rapids "in that thing;" so we landed and took a survey of the falls from the bank. The water ran swift and deep through a channel left in a high dam built for logdriving, and twenty yards below, foaming and breaking, fought its way through jagged projecting rocks. We mapped out a course through the falls, stepped into the canoe, and pointed for the descent. I knelt in the bow, with paddle in haud, while Jerry, armed with a long pole, stood up in the stern, pausing for a moment on the brink; with a light touch of the paddle we shot straight down the sluice, and as we neared the rocks, tried to check our speed with the pole. It slipped on the bottom, aad he fell into the canoe, yelling out, "Gone sucker!" We narrowly escaped an upset, but by a few strokes of the paddle I succeeded in guiding the canoe through the rocks in safety. We lauded below and camped for the night.

Early next morning I went aloae in the canoe, and anchored among the rapids to fish. The trout rose well, and at one cast I hooked three, one on each fly, and netted them all myself from the unballasted canoe. Embarking and running more rapids we arrived at Clyde River village by noon. I was disappointed to find that it was too early there for salmon, and after a day of fruitless casting, we got coaveyance to Barrington, and embarked on the Barrington River. This stream is very rocky, the first ten or fifteen miles of fair width and navigable, and connecting several large and beautiful lakes. A few miles from its source, in Pubuico L., it becomes so narrow that it is very difficult, even for a canoe, to get through, and the banks so overgrown with trees and bushes that fishing is impossible. At the time we ascended, the water was low, and the fishing bad in consequeaee. Where the stream issues from Pubnico L. there are fine deep pools abounding with fine sea trout in Jnne. This point is about thirteen miles from Barrington by road, and affords fine fishing.

It was necessary to wade the last mile or two, as the stream became too narrow in many places to nse either pole or paddle. I waded at the bow as guide for the canoe, with Jerry at the stern, giving such strong and timed shoves as frequently to send me up to my neck in water. We spent two days on this river, and reached Pubuico L., vowing never to return to it. This lake is about six miles long and two in width, studded with islands, aad well wooded. We paddled through it to a landing place, and the succeeding day got an express to Yarmouth, thirty miles distant. A few days more and I was home again, looking and feeling vastly better for any trip into the wilds of Acadia.

As some of your readers may wish to visit this region, I will add something about the route aad equipment. Take tent, and blankets must be taken with you; everything else had better be purchased at Yarmouth. The most direct route is *via* Boston by steamer, leaving Tuesday nooa. The season is May and Jnne; the best time to go usually about the 15th of May. The black flies are troublesome in Jnne, and should be prepared for. Guides aad boats can be engaged by letter to Mr. William Brosser, Kemptville. Boatmen are well paid at $1.50 per day; provisions and lodging cheap. The weather is seldom uncomfortably warm, and the nights are always cool, making a heavy blanket desirable.

MUDJEKEEWIS.

VINE GROWING AT THE SOUTH.—If the reports we read as to the success met with in growing grapes at the South are correct, a source of industry is open to the people which may almost rival cotton growing, being less expensive to continue, and requiring less capital at the outset. Vines near Mobile six years old, are said to produce three bushels of grapes each, making a good wine. It is notorious that almost worthless soil is the best adapted for wine-making grapes. Worn out plantations may yet be made profitable. Let the Western crooked whisky men emigrate, and try making wine on the square.

For Forest and Stream.

WINTER IN MIDDLE FLORIDA.

WHY do seekers after health or pleasure, or both, ever go to East Florida, to walk in Fifth avenne attire on the sandy roads and streets of Jacksonville, to see a repetition day after day of the flat and uninteresting scenery of the St. Johns? Scenery! Can that be called such whose monotone is a weariness to the flesh? Here, in Middle Florida, is the true winter resort for pleasure and health-seekers; at least so I have found it among the pretty wooded hills and lovely dells around Tallahassee and Quincy. The capital of the State is situated on the top of quite a high hill for Florida, said to be 200 feet, or thereabouts, above the sea, and the views in every direction and a great distance are really very fine. Hill upon hill, like the rolling waves of the sea, stretch away to the horizon, each topped by some pretty farm-house glisteuing white from among the trees, each covered by groves whose varying shades of green enchant the eye; the noble pine, with its high straight trunk and branching top, appearing against the sky like a palm tree, and the live oak, that handsomest of trees, with its dark green leaves and spreading branches, add beauty to the scene. The eye is relieved by bright fields that checker the country like a vast chess board, and by the exqnisite lakes and ponds dotted here and there in every direction. The climate is lovely; not too warm, but clear, genial, invigorating; a delicious breeze fans your cheek, your lungs inhale fresh vigor with every breath, and the mere pleasure of life, the simple fact of existence, is almost intoxicating. The drives around are, as a rule, delightful, the roads, except to the south, being of hard clay, making it excellent for horse and wagon. The soil is superior and produces fine crops of cotton, corn, and tobacco, the two former being mostly in cultivation, and of a quality much above the average, though the quantity is small. And here let me notice one of the causes of the general poverty in the South, and the paucity of the crops. During many days riding and hunting over the plantations, both here and elsewhere, we never saw a white man tilling the ground, nothing but the everlasting negro, and as these only labor till they earn enough to keep them in idleness double the time that they work, it is easily conceivable how such unsteadiness and want of application affects the productions of the soil, and indeed the moral and material wealth of the whole country, and yet the negro, properly handled, is an excellent worker, and with a good head over him, will do more in this climate than a white man. As far as my observation went, he is the only hard worker (*i. e.*, in manual labor) in the South, and as a friend remarked to some gentlemen in Tallahasse, if the white Southerners do not look out a little more sharply the black man will be his master some day, for, said he, "I'll back the man that works against the man that loafs, be he white or black." It is no donbt very unpalatable, but take an instance: A friend hired a carpenter (white) to do a job round his house, and on returning home from business found his lordship hands in pockets, leaning against the wall looking on while a darkie was hard at work at the job. Is that darkie going to work for that white man long? No, he will some day take the business away from his boss and pocket the whole profit himself, instead of the pittance he now receives. What the negro lacks—I speak now of the ordinary field hand and laborer—is ambition to lay up something, to possess more than the mere necessaries of life. A large number already own their little cabin aud acre or two of ground, raise their own corn and vegetables, with perhaps a pig or two, and are proud of it, too, but there they stop, and think not of rainy days to come, or hard times, and the provisioas necessary for them. Again, look at the enormous rate of interest on money the Southerners submit to. The only bank in Tallahassee told us they got two and one-half per cent. per month for loans on undonbted security. Two and one-half per cent. per month! What country or community, commercial or agricultural, can stand that without ruination? And such is the actual result. A planter that discounts his crops to the tune of thirty per cent. per annum that does not personally supervise the work done day by day, that spends every cent of his income in advance, what does he, what can he expect but bankruptcy and ruin? There is no money in the South. How can there be under these circumstances? The poorer farmers are forced to barter and exchange kind for kind, aad do they not lose by it? A cattle ranger gives an approximate value in oxen, a farmer in pigs or corn, a few pounds of tobacco, or a bag of cotton; is the woods the poor cut down trees, no matter to whom belonging, rail them to town and exchange for groceries. This may seem exaggerated, but it is not, and though surprising to the Northerner, is not even commented on or noticed at the South.

But let me turn to pleasanter subjects, and give the sportsman some idea of what can be done in his way in this part of Florida. In the environs of Tallahassee and Quincy are great quantities of quail, or partridge, as they call them here; all the old fields and hollows are full of them, aad fine, fat, sweet birds they are. It requires rather quick shooting, as the birds fly low and rapidly, and a covey scatters in all directions when put up. On the lakes and ponds are pleuty of ducks—red-heads and mallards—and a couple of hours in the morning or evening will well repay all trouble, to say nothing of the delightful ride there and back. The dogs are of fair breed, point well, but are badly broken. The horses are good under saddle, and many will stand fire without flinching. This brings me to suggest a trip I took myself, and that is for those who love deer stalking and a life out of doors to get a guide, horses, pack mules, aud a darkie; then, leaving civilization behind them, start right out into the pine forests for a couple of weeks. No tent is needed; a rubber blanket and a shawl for your bed, tea, sugar, coffee, and condensed milk, with a little bacon and flour for grub, some tin ware and cooking utensils, and you can live like a king, getting all your fresh venison, game, aad fish as you go along. There is a superabnndance of light wood for fire wherever you are, and the long dry grass of winter makes an excellent soft couch. The delicious perfume of the pines, the freedom of the woods, the long avenues leading in every direction, green above and green below, with glimpses of a startled deer now and then, or a herd of cattle picturesquely groaped under the trees, added to the excitement of the chase, combine to form a hunter's paradise; and then the glories of the camp fire when, tired and hungry, you throw yourself full length before it, enjoying its warmth aad brightness, or when, after a good supper, the pipes are lit, and the stories aud songs go round, the woods re-echoing to the shouts of laughter or applause. Some writer has remarked that even the highest educated among men are but part savage after all, and there is no doubt no intense pleasure in the wild nomadic life of the woods. To any one with a spark of the man in him the rough life, rough clothes, and rough work (for it is not all play) give a keen zest to life that nothing else can. The expense is not much, not over a dollar per day for each horse, a dollar and a quarter per day for each guide, and three dollars per week for the darkie; provisions are not dear, the main cost being that one always takes far more than one needs. By-the-way, in the list of articles to take I omitted one very important item, *viz:* "a drop o' the eraythur," which is indispensable when wet or cold, aud an excellent cure for snake bites; for though to say the truth, I did not see a snake the whole time I was in Florida, still an onnce of prevention, you know, in that form, is not disagreeable. Speaking of snakes reminds me of the enormous quantity of ferocious animals we were led by our friends to expect to meet in our peregrinations; but alas! after serewing up our courage to encounter all sorts of thrilling adventures, and providing ourselves with weapons of offence and defence, we saw neither bear, panther, alligator, nor snake during the whole time of our sojourn in the Land of Flowers. It was dreadfully disappointing, especially to the youngest of our party, who had made up his mind to be particularly brave, and it was sad to return without some trophy of our prowess. Deer are, however, in great numbers and afford excellent sport, either by stalking or hunting with dogs, and 'tis a beautiful sight to see a noble buck running through the woods, horns back, flag up, and taking such lesps as astonish the beholder, so easy and graceful are they, and no fuss over it, either—done just as easy as the traditional rolling off a log. In proper season I have no doubt there are plenty of bears and panthers to be had, as we found tracks all over; but they, with their friends the alligators and snakes, had all laid up for the winter, and not even a laudable curiosity to see real Northerners brought them ont of their holes. We consoled ourselves with the reflection that their room, under most circumstances, is better than their company.

The hospitality of the Southerners is proverbial, and we eajoyed it wherever we went. The ladies are graceful, chatty, and warm-hearted; the gentlemen, though rather given to enormous visionary schemes, *a la* Col. Sellers, are really obliging, jovial, well-informed men, and none will grudge any trouble to make the stranger comfortable and at home. The great lack of Florida is sufficient traveling accomodation. Not only do strangers suffer from this, but the natives themselves complain of the extreme difficulty of communicatiou between one point and another discommode parties going to that State, especially in the direction of Tallahassee. The Atlantic & Gulf R.R., by their want of common courtesy, force the passenger to lie over at Savannah twenty-two and a half hours, the train arriving from the north at 5:25 P. M., and their only train to Tallahassee leaving at 4 P. M. But I need not trouble my readers with a rehearsal. On the railroads annoyances and hindrances are constantly occurring at every step of your journey to and through Florida, and entirely caused by defective management.

Among the objects of interest near Tallahassee is the famous Wakulla Spring, that fountain of eternal youth, for which Ponce de Leon so vainly searched. A pleasant drive of about fifteen miles brings you to it, when leaving your horses at a farmer's near, you get into a wretched scow and paddle out through the long grasses and lily patches, and over the blue, blue water till you reach the centre. A strange, weird place it is, and a kind of awesomeness comes over one, as oppressed by the intense, painful silence, one gazes around on the tall gaunt cypress, white and ghostly, hung with heavy festoons of the funeral moss, the various deciduous trees growing up in the water, leafless aad bare at this season, that rise around one like the walls of a prison, and seem to shut one in from the world beyond. You look over the boat's side and see the white sands one hundred feet below you, the smallest pebble distinctly visible, and the myriads of fish darting hither and thither in their frightened efforts to escape. The loud, harsh cry of the whooping crane startles you, and you turn to see that huge bird with its heavy flapping wings slowly sailing away in disgust at your presence. You fancy all this time that you are on a pond, till you look around and see that your boat has drifted down the stream, which never narrows, but goes on, on, the same width at its source as at its mouth. The current is about a mile an hour, which, combined with its depth and width (say 300 yards), will give the reader an idea of the great bulk of water, nothing more nor less than a full-grown river flowing out of the earth and away towards the ocean. The visitor can also vary his amusements by a trip to the gulf, where fish, oysters, and ducks abound. There is a tri-weekly train from Tallahassee to St. Marks, and from thence he can get passage in an oyster schooner to Apalachicola, where he will find good accommodations and excellent sport.

The chief expense of a trip to Middle Florida is the fare going and returning. By rail from New York all the way there aad back, with meals, etc., on the journey, it will cost about one hundred dollars, but it can be done by steamer, and taking a return ticket for I believe one-half of that amount. The City Hotel of Tallahassee, which is well kept, has large, airy bed-rooms, good fare and attendance, at two dollars and a half per diem, and at Quincy several excellent boarding-houses are to be found, charging thirty dollars per month. A carriage and pair with driver from three to five dollars per day, according to distance traveled, and a saddle horse two dollars per day, though a bargain for regular use can be made at much less terms. Even the rates above named are but little over half what they cost at Jacksouville, and this of itself is a great desideratum to those of moderate means who wish to pass a pleasant winter at moderate expense. To all such, whether seekers after health or pleasure, I would again recommend Middle Florida.

T. B. L.

March, 1876.

—The total number of Indians in the Dominion is returned at 91,910. Of these 15,000, (roughly speaking) are in Ontario; 11,000 in Quebec, 25,000 in Manitoba and the Northwest Territories; 5,000 in Rupert's Land, and 31,000 in British Columbia; Nova Scotia and New Brunswick each coataining less than 2,000, while Prince Edward Island only 302.

—Said an Irish justice to an obstreperous prisoner on trial: "We want nothing but silence, and but little of that."

HISTORIC ONONDAGA.

A TERRITORY famous in history as far back as 1643, the scene of many battles, and for centuries the home of a once honorable and powerful tribe of Indians—the Onondagas. A century or more ago the county was rich in fish and game, and was choice hunting ground. Its sturdy forests gave way to civilization, and now it is one of the wealthiest counties of the State, and has a population of about 110,000. Some eight miles south of Syracuse a remnant—numbering about 300—of the once honored and powerful tribe is still found, scattered over a large area of uncultivated land, known as the Onondaga Reservation. They still maintain many of their rites and ceremonies, though they have become semi-civilized, and quite recently elected a chief, according to the usages of a century ago. The old chiefs have all passed away. Capt. George was the last of the ancient line, and his death seemed to sever much of the past from the present. He was a noble, stalwart, intelligent chief, and in his day among the best warriors and hunters known to the Five Nations. They are now an indolent class, subsisting on the commonest food, and in scanty quantities at that. Many of them are still adepts with the bow and arrow, and all retain a love for hunting and fishing. There are many evidences of the once fruitful "happy hunting grounds" remaining. A century ago Central New York was densely covered with sturdy timber, and it requires no very vivid imagination to picture a country as wild and picturesque as the great Northern Wilderness is now, and thousands of times more valuable. Looking out from Syracuse, we see the Oneida Lake, twelve miles distant on the north, well stocked with bass, pickerel, and other varieties of fish, with its outlet leading into the Oswego River, famous half a century ago for its eels, and now for its Oswego bass. To the south are a dozen small lakes and many streams where trout flourish, and in Skaneateles Lake, clear and cold spring water, as handsome salmon trout are taken as ever struck a hook. To the westward are Cayuga and Seneca lakes, which flood thousands of acres, known as the Montezuma marshes, by all odds the most fruitful locality for ducks and snipe anywhere in this region. The marshes are drained into the Seneca River, which has an outlet into the Oswego River, crossing the foot of pretty Onondaga Lake, 1x6 miles, near this city, where there is found at proper seasons good fishing and shooting.

The rolling lands of the county are particularly favorable for the maintenance of trout streams, but with so many anglers as are found here it is not surprising that the streams are rapidly becoming barren. A few catches are brought in betimes from streams in the towns of Pompey and Fabius, in the southern part of the county.

Reuben Wood is the Seth Green of Syracuse—a fat, jolly, and faithful son of Walton, who is a sort of oracle among anglers. He has fished everywhere, and "the boys" do say he can catch a trout where one was never seen before.

John H. Mann is both a good angler and hunter, and the inventor and maker of trolling spoons.

There are many evidences still in existence of the different races of people who have been upon the soil of this locality, and also of the turmoils that have at various times stained its acres with blood. In the town of Pompey stones bearing singular carvings and unintelligible hieroglyphics have been found, which, taken in connection with a sugar-loaf shaped hill a short distance south of Syracuse, at once reminds us of Phœnecians and mound builders. Crucifixes, medals, and other articles of antiquity have been from time to time found, and distinct traces of fortifications, of which nothing whatever is now known, have been found in several localities. The French war left forts at the outlet of Oneida Lake and at Green Point, and though constructed more than a century ago their outlines are still well defined. Stone axes, arrow points, and many other Indian antiquities are so frequently found that they attract little interest. Rev. Dr. Bush, of Cicero, has a very large and interesting collection of such articles.

There is a deal of mystery connected with the history of this locality, and it is certain that a vast amount of very valuable knowledge and information has been lost to history. This is particularly true of Syracuse and the country immediately surrounding it, and embracing the wonderful salt springs, once valuable only as deer licks, and now yielding annually many million bushels of salt. There is every reason for believing that this locality was not long ago covered with water, and a water line is easily traced along the base of the mountainous hills on the south. That there has been a vast amount of wash from these hills is proven by the discovery at various times of the heads and antlers of deer, bones of large animals, and, in sinking a salt well, pieces of an elm log 180 feet below the surface were brought up, and sea shells have been found at as great a depth. There are people now living who remember when the land now occupied by the Central City was a dense swamp, full of rattlesnakes and other venomous reptiles, together with ferocious wild animals.

For Forest and Stream.

THE GREAT FALLS OF THE POTOMAC.

THERE probably is not in all the broad limits of this Union a river which unites more sport of flesh and fowl, more picturesque beauty, and more varied grandeur than the Potomac, or, as the old chronicles spell it, Paw-to-meck, meaning in the Indian dialect, "The River of Swans." Commencing and originating in the Alleghany Mountains, it ripples along a small stream, but still is the dividing line between the two States of Maryland and Virginia, and gathering strength as it advances—fed as it is by numberless small streams and creeks—its banks widen, its depth increases, and current grows more rapid, until it reaches the Blue Ridge Mountain, when it assumes the appearance of a swift flowing river, and it rushes through the mountain pass at Harper's Ferry a stream of indescribable beauty; still onward it flows until within some ten miles of Washington, when the river tumbles over the Great Falls.

The scenery at this place looks as if there had been a war of the Titans, huge masses of rocks of every conceivable shape and size wall in the river, and through its rocky bed the Potomac falls some thirty or forty feet, and dashing upon the rocks below, all churned into white foam that bubbles and seethes in mad turmoil, eddying and surging around the rocks. The river here is shut in a narrow passage of about two hundred feet, and the roar of the falls and bubbling of the water can on a calm day be heard for miles. Around the falls there is a long avenue of trees, and there are some of the most beautiful and romantic spots I ever saw, rivalling in scenic loveliness Watkin's Glen. This place is celebrated for its bass fishing, and is a famous spot for anglers, and those disciples of Izaak Walton who delight to catch these gamy fish. They are very plentiful at the foot of the falls, and as many as one hundred have been caught in one day by a single rod, varying from nine to fifteen inches in length. The bait is a silver minnow, and as it is twirled in the water, the bass takes it at a dart. There are many different kinds of fish in the river a little below the falls that can be caught in great profusion. I know of no place where the fisherman can so successfully prosecute his trade, and have more enjoyment at such a cheap rate as at this lovely spot. Good board can be obtained at the falls for a dollar a day, and boat and lines thrown in, and there are no extra expenses that I know of. Write to Mr. Wm. E. Dickey, Springvale, Fairfax County, Va., and he will give all necessary information. At the foot of the falls is the celebrated haunt of the shad, and men with dip nets, stripped and tied for safety to the rocks, take them out in great numbers. A tragedy happened there, a few years ago—two negroes were engaged in dipping out shad, when one taking his turn refused to tie himself to the rock, saying that he could swim out easily. He was a tremendous fellow, and a splendid swimmer, but he fell in and was tossed like a cork from side to side, and though he struggled for his life gallantly, and tried to reach the rock, yet the waves bore him circling around until he sank to rise no more, and his horrified companions could do nothing to save him. His body was never recovered though every effort was made. A singular fact is that the depth of the water at the foot of the falls has never been ascertained, though there were repeated trials. It must be like the "devil's hole," near Niagara—bottomless. To a lover of the grand and beautiful this is a favored spot, a few days could be most enjoyably spent, and the reality of the scene must be left to the imagination. I can no more do justice to this sublime picture of the falling water, nor convey an adequate idea of its grandeur and grace by my pen, than can an artist by his pencil paint the cataract; he may represent the whole expanse of falling waters, the foam, the cliffs, the spray, but where is the motion, where is the rush of the torrent, the smooth gliding of the waves above the falls, and the dash of the waters beneath, the ever-changing glistening stream, with its vivid rainbow shifting from point to point—no, it can never be done by the pencil or brush, nor even by the pen of an Onida, a de Lorgy, or a Julie d'Artonne.

I have said that the Potomac was as fruitful for game and fish as any river on the continent. Such has been the fact, its waters swarming with wild-fowl, its creeks with birds delicious to the epicure, and its depths teeming with fish of many varieties, made it the paradise of the sportsmen; but now all this is changed. The hundreds of pot-hunters kill all the birds, swivel guns and the deadly sink boxes exterminate the wild-fowl, and the seines and gill-nets devote the fish to destruction. Unless the States of Maryland and Virginia pass stringent game laws, and that very soon, the superb sport in the Potomac for the sportsman and fisherman will be a myth and a tradition. It is estimated that there are fully one thousand gill-nets always set on the Potomac from the mouth of the Chesapeake to Washington, and they destroy ten fish where they catch one. To show the consequence, and the truth of my assertion, I will give, as Mr. Grudgrind would say, a few facts: At the Stony Point landing, (fished this year by Mr. H. Clark), there are employed seventy-five men, with a steam engine for hauling, and this week, with a five-mile seine, the hauls averaged but 600 shad, when a few years ago 60,000 shad was a common haul. At Highpoint landing Capt. Cramp employs sixty-five men, and he averages about 300 shad and as many herring. And this is but the tale of all, and the fisheries have proved a failure, and nearly all the proprietors of the landings have in despair "cut out" with a heavy pecuniary loss. This tells its own tale; and it is a shame upon both States that the enactment and enforcement of adequate laws for the protection of fish and game have not been made. And not until the press brings this subject home to the people will it be done.

In conclusion I will say that the best time to fish at the falls or in the river is the latter part of this month until July. CHASSEUR.

Alexandria, May 6th, 1876.

A PETRIFIED FOREST IN THE DESERT.—David Rideout, who has been engaged in preparing a section of a petrified tree for the Centennial Exposition, gives the following relative to the petrified forest of northwestern Humboldt. On the plain, about thirty miles west of the Black-rock ridge of mountains, stands one of the greatest natural curiosities ever discovered in Nevada. It is a petrified forest, in which the stumps of many of the trees, now changed into solid rock, are still standing. There are no living trees or vegetation of any kind other than stunted sage brush in the vicinity. Some of these ancient giants of the forest, which flourished perhaps thousands of years ago, when the climate of Nevada was undoubtedly more favorable for the growth of luxuriant vegetation than at present, rival in size the big trees of California. Stumps, transformed into solid rock, stand in an upright position, with their roots imbedded in the soil, as when growing, that measure from fifteen to twenty-six feet in circumference, and the ground in the vicinity is strewn with the trunks and limbs, which retain their natural shape and size. Mr. Rideout, determined to secure a section of one of these trees for the Centennial Exposition, with two other men, spent twelve days in cutting it from the stump. This was accomplished by drilling all around the tree and separating it with wedges. The specimen is three feet high and eighteen feet in circumference, and its estimated weight is three tons.

—The London *News* of the 29th gives an itinerary of the new lines of coaches, the gentlemen drivers of which include the Earl of Beetive, Col. Chaplin, Major Furnival, and other members of the aristocracy. Above a half-dozen lines are enumerated.

—Spain, having got rid of the plague of Carlists, is now suffering from a plague of locusts; and the soldiers have been told off to destroy the insect devastators.

Fish Culture.

THE USE OF POUND NETS IN INLAND WATERS.

DEPARTMENT OF MARINE AND FISHERIES,
FISHERIES BRANCH, OTTAWA, 26th April, 1876.

SIR—Reverting to several telegraphic and other communications which have lately passed between the Minister and yourself, on the subject of the close seasons for spring breeding fishes, and the use of gill nets and "pounds" for the capture of those and other fishes during the spring and summer time in Lake Erie and the Detroit River, I am desired to request your attention, and that of other parties more immediately interested, as well as of the general public, to an entirely disinterested view of the matter.

The close seasons for pickerel, maskinonge, and bass are fixed by the Fishery Regulations of the 3d September, 1875, at various periods between the 15th April and the 15th June, and for whitefish between the 12th November and the 1st December. In adopting these restrictions the Government has in view the protection and increase of fish, the improvement of the fisheries, and the lasting benefit of the fishermen and consumers.

The operation of these necessary regulations appears to some—and usually to those persons who are at least impatient, if not altogether opposed to, any restrictions whatever on their fishing pursuits—to be comparatively injurious to Canadian fishermen, in consequence of their proximity to United States fishermen, who are said to fish unrestrictedly within the same geographical district. Whenever, therefore, the close seasons adopted, or methods of fishing prescribed, are found to curtail somewhat the operations of Canadian fishermen engaged in these border waters, the cry is raised that we are protecting fish for the benefit of United States citizens; and that we not only deprive British subjects of catching the fish in Canadian waters when the market is most profitable, but thereby abandon such market to the exclusive profit of our foreign neighbors. It must be admitted that all this seems at first sight to be very plausible, and is no doubt well calculated to attract public notice and enlist local sympathies. But is it not, in a considerable degree at least, fallacious? Every unbiased and observing person, who devotes any attention to this subject, knows that the spring and summer fishes of our great inland lakes are attracted inshore and towards the islands and shoals by the two great leading instincts of want of food and reproduction. The quantity of food and the facilities for propagation are quite as attractive generally on the Canadian as they are on the United States side of the lakes and rivers. Indeed, it is pretty well known that, with the sole exception of the shoals around those groups of islands which are situated on either side of the boundary line, the best feeding and breeding places are on the northern shores and in the waters of Canada. Then, as regards the "deep sea" fishings in outside waters, the fish frequenting those areas which are more or less open to both nations, cannot be considered in any other light than a common property of mutual advantage altogether irrespective of the shores to which they may resort for nutriment or to increase their species. It seems, therefore, conclusive to impartial minds that the invidious effect of our protective system is in fact and effect, however convincing in theory and appearance, much more fanciful than real. The idea that, in such extensive bodies of water as the great lakes, the local range of various kinds of non-migratory fishes extends across an imaginary water boundary, is not at all a practical one. It has been very industriously cultivated in support of claims made by fishing communities to be exempted from economical restrictions; but it is so obviously an excuse that the parties using it have always confined themselves to mere assertions.

Regarding the licensing of pound nets, it is necessary to make some observations. The pound net is an American invention. It has succeeded in fishing out certain United States waters, and has gradually crept into ours. Its destructive qualities are indelibly impressed on the languishing fisheries of the Lake States and the impoverished shores of the northeastern Atlantic States of the American Union. It flourishes for awhile everywhere, and having exhausted fish in one locality it is shifted to another. Fishing in season and out of season, and all through every season, for all kinds and sizes of fish, it abates not its ravages for any cause but exhaustion. This is substantially the account given of its workings in the United States by Professor Baird and Mr. Milner, two able officials of the Federal Government. The Fishery Laws of Canada have always prohibited this obnoxious engine, but out of consideration for the relative position of Canadian fishermen living on the lakes where pounds were in common use by their American neighbors, the Fisheries Act provides for their use under certain conditions imposed by means of special licenses. Hence their existence on the shores of Lake Erie. Notwithstanding these precautions, and the imposition of a heavy license fee, they have multiplied under the pressure of just such arguments as are now used to induce us to remove from them every prudent restriction. The applicants for licenses to set additional pounds each year are almost invariably connected with the interest of United States citizens, who have fishing gear to use or dispose of, or have overcrowded or used up their own fishing grounds. In addition to their increase in numbers, their capacity has been enlarged, and it has proved impracticable to ensure the strict observance of close seasons for any kind of fish so long as they exist. Each holder of a pound net license binds himself to observe the fishery laws. Yet he does no such thing. He catches fish when everybody else is forbidden, and by means of nets having meshes of a size prohibited to all other fishermen. Complaints against the "pounds" are frequent from the gill netters and seiners. They fish steadily from morning to night throughout forbidden periods, when certain kinds of fishing are unlawful, ostensibly catching other kinds of fish which are always in legal season. Their owners assert that it is impossible to put them into disuse from Saturday nights to Monday mornings, during which time the fishery laws and the Sabbath observance laws forbid every description of fishing. The seine fishermen on the Detroit River, and the gill net fishermen around the islands in Lake Erie, incessantly complain that whilst they are compelled to observe the close season for pickerel, maskinonge, and bass in the spring time, and for whitefish in the autumn, and to do this are obliged to desist altogether from fishing, the "pounds" are killing off everything. They con-

tinue in place during the weekly close time, when all other nets are raised or disused. It is represented that there is no attempt made to liberate alive the forbidden fish in accordance with the law and the license. This state of things has caused frequent remonstrances on the part of seiners and gill netters, as you are no doubt aware. And it was for such reasons that the Department found it necessary, after several years of expostulation and forbearance towards the owners of pound nets, to insert in their licenses for 1876 a specific condition that the capture of pickerel, maskinonge, bass or whitefish during the respective close seasons for those kind of fish would subject the licenses to forfeiture. The owners of pound nets, who have all along contended that their pounds are fished in such a manner as to enable them to release alive all prohibited fish, suddenly declare that if held to a strict observance of the close season at present in force for pickerel, maskiuonge, and bass, they cannot catch herrings, sturgeon, and whitefish. This is the cause of all the outcry which has arisen. There has been no new fishery regulation sprung upon them, and nothing more than usual done beyond binding them to observe the close seasons for certain fish, which all other fishermen find themselves compelled by the Fishery Laws to respect.

It is hardly necessary to remark, in conclusion, that in making allowance for the lateness of the present spring, and other circumstances which you have urged on behalf of the fishermen, by permitting them to fish for all kinds of fish up to the 1st of May, the Minister gives fresh proof that it is still, as it ever has been, the earnest desire of his Department to so deal with fishery matters as to promote the truest interests of the public and all others concerned, whilst affording always reasonable relief to those more immediately interested, on whom existing circumstances might bear with undue severity.

I have the honor to be, Sir, your obedient servant.

W. F. WHITCHER,
Commissioner of Fisheries.

WM. MCGREGOR, Esq., M. P., Windsor, Ontario.

[From the London Field.]

FISH CULTURE UNDERTAKEN BY COMPANIES.

A RECENT official report on the industries of the Grand Duchy of Baden communicates the following interesting information respecting the fish cultural undertakings of that country.

Owing, it appears, to the advancing price of nearly all articles of food, and the greatly increased demand for trout, grayling, etc., at the different watering places of the Black Forest, the culture of these choicer kinds of fish has been much more remunerative of late throughout the Duchy, and every year adds to the number of its pisciultural establishments. Two of the most important of the latter are those carried on respectively by the Baden and Bonndorf Companies, and a few particulars respecting their organization and management may perhaps be not unwelcome.

Commencing with the Freiburg undertaking, that conducted by the Baden Company, it was proposed in 1865 to raise a capital of 40,000fl. (rather less than £3,400) by the issue of 1,600 shares of 25fl. (about 2 guineas), each payable by instalments in five years. Should the net profits in 1870—the first year fixed for the payment of any dividend there might be—exceed 5 per cent., the excess was to be put aside as a reserve fund, the same measure being adopted annually until the reserve capital amounted to another 40,000fl. Private individuals or parishes not taking shares, but contributing by voluntary subscription to the support of the undertaking, could in turn claim the assistance of the institution should they at any time require professional advice as to the erection of hatching works, the stocking of rivers, etc. Towards the construction of the building, which is the property of the present director, the State contributed the sum of 2,000fl. (£166), and the annual Government grant since 1871 has been 1,000fl. (£83). This State support is given on condition that the company shall undertake to supply pisciculturists resident in the Grand Duchy with fertilized ova and young fry at a lower charge than is made to outsiders; and since 1871 the prices have been 3s. 4d. per 1,000 for salmon or river trout eggs, 3s. 6½d. per 1,000 for char, lake trout, and hybrids of salmon; and 15fl. (25s.) per 100 for young fry, the latter having arrived at the close of the yoke-sac period. Purchasers not living in Baden have paid 6s. per 1,000 for river trout and salmon eggs, and 8s. for hybrid ditto; and such care is observed in the packing of them, that in the case of a large consignment to Turin, which, owing to some irregularity remained eleven days *en route*, the mortality only amounted to 2 per cent., and the loss last winter on a sending of 5,000 ova (first batch of a consignment of 25,000) despatched to the north of England, did not exceed one eighth per cent. The eggs forwarded to Turin were packed in layers of moistened cotton wool; those sent to England in moss.

Since 1865, when the Freiburg works were first planned, the buildings have been considerably enlarged, and now contain appliances and accommodation for incubating over 1,000,000 eggs. The cement hatching troughs, twenty-two in number, lately introduced in the place of wooden ones, are fitted up with lids, which will open and shut; and at intervals in the same there are wire-covered openings, with slide doors for admitting the light gradually. At one time spring water was preferred for incubating purposes; but experience having shown that brook water, which is colder and more aerated, produces healthier and hardier fry, it is now arranged that the hatching troughs and ponds shall be supplied with water from a mountain stream, and only receive sufficient spring water to prevent the temperature falling below 37° Fahrenheit. Each of the nine ponds belonging to the establishment, some made shallow for the young fry, others tolerably deep for the spawning fish—in addition to the supply it receives direct from the stream, is fed by the overflow from the pond immediately above it. By a simple contrivance, however, the water from both sources can be turned off at any moment and the pond run dry.

Concerning the food given at Freiburg, this consists of ox and calves' brains, of finely-chopped refuse meat, etc., (heart, liver, lungs, etc., of freshly killed animals), from the slaughter house, and of minced horseflesh. During the first few months brains are looked upon as especially suitable food, being light and nutricious, and not liable, as is the case with meat, to sink to the bottom and taint the water. Of this fare the young fry require a good supply three times a day.

As to the number of young fish turned every year into the waters rented by the company—*i. e.*, the river Dreisach and its tributaries—this amounted in the winter 1873-74, to take an average season, to 100,000 river trout and hybrids of salmon, and 20,000 salmon.

The subjoined figures, on the other hand, represent the quantity of ova and fry disposed of between 1870 and 1874:—

	1870-71.	1871-72.	1872-73.	1873-74.
FERTILIZED OVA.				
Name.				
River trout	25,400	35,500	50,500	94,000
Salmon	8,800		3,500	4,000
Hybrids of Salmon	7,500	10,000	6,000	16,500
Charr	—	—	13,000	6,500
YOUNG FRY.				
River trout	3,300	5,000	13,500	12,600
Salmon	100	2,000	3,000	
Char	500	2,000	11,800	5,100
Lake trout	300	1,000	2,200	1,300

The eggs are mostly despatched in the months of January and February, young fish in March and April. In the case of a long journey and large sending of fry, it is considered desirable for a man to accompany the latter. Applications for ova require to be addressed to Herrn Oberbürgermeister Schuster, Director of the Institution, before October 1st each year; and for the guidance of any one desirous of visiting the works, we may mention that they are situated on the above gentleman's property, Selzenhof, about six English miles from Freiburg, eastward of Hexenthal.

With regard to the only other pisciculturat company out of the many lately formed, viz., that of Bonndorf, respecting which details are given in the official report, we are told that its new and larger establishment in the valley of the Wutach was completed in 1873, and covers, including ponds and runlets, an area of about eight acres. The supply of water is obtained in part from two springs, (which furnish 120 gallons per minute), in part from the neighboring river; the system of mixing the two kinds of water for incubating and rearing purposes being adopted here as at Freiburg.

In the year 1873 the company hatched out 600,000 eggs, turned 400,000 young fry into its ponds, and sold 4 cwt. of grayling, and rather over two tons weight of trout. It now rents the greater part of the river Wutach and its tributaries.

—Dr. M. C. Edmunds, fish commissioner of Vermont, left Rutland on the 10th, says the Rutland *Herald*, with a quantity of salmon fry intending to plant them at Wells River. Before starting the fish began to show symptoms of dying, by reason of some carbonaceous substance in the water, and before he had proceeded far their mortality was so rapid that he concluded to turn them loose in the first water he came to. This he did in the Winooski River, at what is called Lime Kiln Fall. Thirty per cent. died in the transit, and the whole quantity would doubtless have perished before reaching their destination. Only once before, the doctor says, has he met with such ill luck, and then a stream in Massachusetts got stocked with salmon that otherwise would not have received any. Parties in Northwestern Vermont will doubtless be disappointed for the time being by this loss, which has proved to be Winooski's gain, but dead fry would hardly have served their purpose. The mortality of the fish on this occasion cannot be accounted for, as the water had been changed just before starting.

—Forty thousand more young trout have been placed in Lake George and adjoining streams in Vermont, making in all 120,000. A local fish and game protective association is to be formed at St. Albans.

BLACK BASS IN WINTER.

JACKSONPORT, ARK., May 5th, 1875.

EDITOR FOREST AND STREAM:—

In your issue of April 27th, I noticed a letter from Fred Mather on the above subject. From an experience of several years, I am satisfied that our black bass (*Grystes salmonides*) do not hybernate in winter. They are caught here at all times in the winter months regardless of the cold, whenever the water is low enough. My friend Peter Bach, of this place, frequently fishes for them when the intense cold requires a fire on the bank to keep warm by. On the 31st last December, in deep water at the mouth of Wall's Lake, above here, on White River, I took with the Whitehall spinning bait my half of a large wash-tub full of black and striped bass—mixed about half and half—and on the next day, which was very cold, took both sorts together with dominique perch, upon minnow bait. I have taken them, and have seen them taken here every winter for several winters by sportsmen fishing for "jack salmon," (pike perch), and am fully satisfied that in this locality they are "lively" all winter.

WM. A. MONROE.

WEST MERIDEN, CONN., May 8th, 1876.

EDITOR FOREST AND STREAM:—

There is much said here and in different parts of the country, just now, about our black bass fishing. On all sides I hear expressions of dissatisfaction, and I believe there are good grounds for it. Lovers of the rod who were wont to visit favorite ponds, certain to return with a satisfactory basket of pickerel, do so no more, for some body has planted the ponds hereabouts with black bass and our pickerel are not to be found, and the worst of it is, that no body seems to meet with any success with the bass, either. I know that some few bass have been caught in a pond not far from here, but do they compensate for the loss of fine strings of pickerel which were caught there almost daily during the season? Now if it be true that pickerel and trout are being destroyed by the bass, would it not be well to be on the safe side and not stock so many of our ponds with them? I would be glad to hear the opinion of others on this subject. VON G.

SUBTERRANEAN FISH.—The Virginia City *Enterprise* (Nevada) is responsible for a report that curious specimens of fish have been found in the water now flooding the Savage and Norcross mines. The fishes are eyeless, and are only about three or four inches in length. They are blood red in color. The temperature of the water in which they are found is 128 degrees Fahrenheit—almost scalding hot. In appearance they somewhat resemble the goldfish. They seem lively and sportive enough while in their native hot water, notwithstanding the fact that they have no eyes nor even the rudiments of eyes. The water by which the mines are flooded broke in at a depth of 2,200 feet in a drift that was being pushed to the northward in the Savage. It rose in the mine to the height of 400 feet. This would seem to prove that a great subterranean reservoir or lake has been tapped, and from this lake doubtless came the fish hoisted from the mine.

Natural History.

[This Department is under the charge of a competent Naturalist, indorsed by the Smithsonian Institution, and will henceforth be made a special feature of this paper. All communications, notes, queries, remarks, and seasonal observations will receive careful attention.]

For Forest and Stream.

THE AMERICAN GRAYLING.

"The grayling is not found in America, except in the Arctic regions, where swims the magnificent *Thymallus signifer*, requiring as much dexterity to land as a trout six times its size."

THESE are the words of that enthusiastic angler, and most scholarly and eminent divine, Dr. Geo. W. Bethune, in a foot note of one of the most popular editions of "Walton and Cotton's Complete Angler." Familiar as he seems to have been with the entire range of authors, in everything pertaining to fish and fishing, from Diodorus Siculus, and the Halieutics of Oppian, down to the latest monograph on practical angling, he appears to have overlooked certain important, and interesting facts in regard to the habitat of the grayling. Nor is he alone, for many others, I find have fallen into the same error. It is with the intention of correcting what I honestly believe to be a mistake in regard to the discovery of the grayling within the United States, and from a sincere desire to have honor rendered to whom honor is due, that I send this contribution.

Although the grayling was well known, and held in the highest estimation in Central Europe, as far back as the days of St Ambrose, who considered it as the "flower of fishes," and although it has been the coveted object of the angler's skill in the rivers of Great Britain from the time of honest Izaac Walton, no species of the genus was known to exist on this continent until the discovery of Back's grayling (*Thymallus signifer*), in one of the tributaries of the Polar Sea at the time of Sir John Franklin's first journey to the Arctic regions in 1819. So far as I can learn from any works on ichthyology, or from the reports of Fish Commissioners, fish culturists or anglers, no one claims to have discovered any species of grayling within the United States until 1847 or 1848. Prof. E. D. Cope, of Philadelphia, in 1864 examined a collection of fishes belonging to some of the educational institutions of Michigan, and among them found some specimens of a grayling from the waters of that State, to which he gave the name of *Thymallus tricolor*. Since that time the habitat of this fish seems to have extended over a wide area of our country. It has been found to be more liberally distributed in the waters of Michigan than in any other portion of the country up to the present time; the clear, cold rivers, Jordan, Ausable, Muskigon, Marquette, Rifle, and other streams emptying into Lake Michigan, or Lake Huron, containing this beautiful, delicious, and gamy fish in such numbers as to afford fine sport to the angler. Those of my readers who have not enjoyed the oportunity for personal experience in taking this savory fish, have doubtless been delighted in reading the spicy sketches of the exploits of the renowned "Uncle Thad," and his friend D. H. Fitzhugh, on the Manistee and Ausable. So far as discovered, the grayling of this country is much inferior in size to the grayling (*Thymallus vulgaris*), of England. While in this country the average size is from half a pound to a pound; in England the average size is from one and a half to two pounds, and specimens are often taken of three pounds. Since this fish has attracted so much attention, is found to afford such genuine sport to the angler, and is reputed to be so edible and delicious as to rival the *Salmo fontinalis*, you will surely pardon me, if I propose the question: Who was the first to discover, and mention the grayling as a habitue of the waters of the United States? In solving this problem, no doubt the name of Prof. E. D. Cope, will occur to the mind of the intelligent reader. To him doubtless belongs the credit of being the first to describe in scientific form, and to name *Thymallus tricolor* the species which he found in 1864. To Mr. D. H. Fitzhugh, of Bay City, Michigan, some credit is also due for his discovery of this species in its native streams, and for procuring and forwarding specimens to Chas. Hallock, Esq., Editor of FOREST AND STREAM, and also to the National Museum at Washington, in 1873.

In connection with this subject, there is an important fact, which does not seem to be generally known; indeed it appears to have entirely escaped the observation of that class of persons who take a special interest in ichthyology, and who would give to any new fact bearing upon the subject, the consideration and credit which it justly deserved. Among the books which have chanced to come into my possession during the last year, and which I read with unabated interest, is the "Narrative of a Journey across the Rocky Mountains to the Columbia River," by John K. Townsend, member of the Academy of Natural Sciences, Philadelphia. He and his friend, the late Thomas Nuttall, the eminent botanist and for many years Professor of Natural History in Harvard University, joined a party of men under Capt. Wyeth, who crossed the Rocky Mountains to the Pacific Coast, in the interest of "The Columbia River Fishing and Trading Company." The object of these distinguished naturalists in joining the expedition, was solely to obtain specimens, and gain information in regard to the Fauna and Flora of the extensive country intervening between the Mississippi and Columbia rivers. They were both eminently qualified for the successful prosecution of their cherished enterprise. Leaving St. Louis on March 29th, 1834, and pursuing their journey westward, they came at length to the banks of Green River, Siskadee, or Colorado of the West. This was on June 30th, a most favorable season for camping on the banks of a beautiful stream, abounding in delicious fish. He says on page 76, "Our camp here is a most lovely one." * * * Our tents are pitched in a pretty little valley, or indentation in the plain, surrounded on all sides by low bluffs of yellow clay. Near us flows the clear, deep water of the Siskadee; and beyond on every side is a wide, and level prairie interrupted only by some gigantic peaks of mountains and conical *buttes* in the distance. The river here contains a great number of large trout, *some grayling*, and a small narrow-

mouthed white-fish resembling a herring. They are all frequently taken with the hook, and the trout particularly afford excellent sport."

If I am not mistaken, we have in the above paragraph, the first recorded discovery of the grayling within the limits of the United States territory.

Five days after leaving their camp, on the banks of the Siskadee, we find them encamped on Bear River, about one hundred miles above Salt Lake. In regard to this river he writes on page 80: "This is a fine stream of about one hundred and fifty feet in width, with a moveable sandy bottom." Under the same date, July 5th, he also writes: "Trout, *grayling*, and a kind of clear, arc very abundant here, the first very large.

In conclusion I will venture to assert that, in my opinion, the fact is very clearly established that to John K. Townsend belongs the honor of having first published to the world, that grayling existed in the waters of the United States. If any one is disposed, by way of objection, to state that our author may possibly have been mistaken, and that the fish which he pronounced a grayling was not a grayling, but some other species, widely differing, I would reply that his scientific knowledge, as well as the circumstances under which he must have made his observations, were such as to preclude his making such a mistake. Although he is more extensively known and quoted for his accurate knowledge as an ornithologist, yet he was well posted as to the distinctive characteristics of the grayling. His friend, Prof. Nuttall, who was a native of England, and eminent as a scientist before he came to this country with his thorough knowledge of the English grayling, could not have fallen into an error of this kind. His resemblance to the English species may have been so striking as to lead them to the conclusion that if the two were not identical, the points of difference were so slight as not to entitle it to be classed as a new species. Finally, in view of the fact that Townsend's discovery of genuine grayling in the waters of the Siskadee and Bear Rivers was long prior to the reported discovery of the species in Montana, Michigan, and other parts of the United States, he ought to receive the full credit due to his name; and the American fish discovered by him ought to have received the specific name of *Thymallus Townsendii*.

C. A. KINGSBURY.

Philadelphia, May 13th, 1876.

FIELD NOTES AT RIVERDALE.

April 2d.—Clear; warm south wind in the afternoon. Much insect life at the pond. Some buds of saxifrage (*Saxifraga vernalis*) almost open.

April 3.—Southeast rain all day. Kingfisher made its first appearance.

April 6th.—In early morning noticed a solitary blue heron (*Ardea herodias*) flying northward over the fog-enveloped bushes of a swamp; saw the first yellow-bellied woodpecker (*Sphyrapicus varius*) since January 22d.

April 7th.—Field sparrow (*Spizella pusilla*) first seen.

April 9th.—Thermometer 27°, the lowest point reached this month; northwest wind. Flushed an English snipe, (*Gallinago Wilsoni*); golden crested kinglets (*Regulus satrapa*) abundant for the first time since last fall; have only noticed them once or twice during the winter. "Dutchmau's breeches." (*Corydalis cucularia*) in bloom.

April 11th.—Yellow-rumped warbler (*Dendræca coronata*) seen.

April 12th.—Warm south wind. Fish hawk has arrived; golden-winged woodpecker seen for the first time since March 13th.

April 13th.—Purple finch (*Carpodacus purpureus*) seen; none of these birds were observed here the past winter.

April 14th.—Very foggy in the morning; cloudy all day, with warm south wind; saw several hermit thrushes (*Turdus Pallasi*) and ruby-crowned kinglets (*Regulus calendula*); also yellow red poll warbler (*Dendræca palmarum*), and chewiuk, (*Pipilo erythrophthalmus*). Started two night herons (*Nyctiardea grisea*) in a swamp, and noticed two white-bellied swallows (*Tachycineta bicolor*) flying north. Robin first seen building.

April 15th.—The warmest night of the month; the temperature did not fall below 47°. Chipping sparrow first seen; for four years I have observed this bird arrive exactly eight days after the field sparrow; there is a remarkable regularity among several other birds in their relative arrival, but I have observed no instance as marked as this. Swamp sparrow (*Melospiza palustris*) seen. Phœbe-bird has begun building.

April 16th.—Dandelions and dog-toothed violets (*Erythronium americanum*) in bloom.

April 17th.—Saw several yellow-winged sparrows (*Passerculus savanna*). Two brown thrashers loudly proclaimed their arrival this morning from the bushes by the roadside.

April 19th.—Cold northwest winds; flurry of snow. Vesper sparrow (*Poœcetes gramineus*) first observed. Wild violet out.

April 22d.—Saw one solitary vireo (*Vireo solitarius*), which was very common last fall; it arrives in the spring earlier, and departs in the fall later than any of the other vireos.

April 23d.—Water snake seen; this is the first snake that I have seen this spring. Several anemones (*Anemone nemorosa*) and marsh marigolds (*Caltha palustris*) found blooming in the swamps.

April 24th.—Barn swallows (*Hirundo horreorum*) have arrived. Two green herons (*Ardea virescens*) seen.

April 25th.—Procured a specimen of the rough-winged swallow, (*Stelgidopteryx serripennis*), the first that I have ever seen here. Several of them were noticed at the pond; they appeared to light on the trees and bushes oftener than the other swallows and were very tame and unsuspicious.

April 27th.—Currant bushes in blossom, and a few cherry blossoms out. House wren singing around the house in the morning.

April 29th.—Noticed a purple martin flying north; this species is very uncommon here at all times; also observed a chimney swift (*Chætura pelasgia*) and cliff swallow (*Petrochelidon lunifrons*). White-throated sparrow abundant; a few remained with us through the winter, but have not been common till to-day. Wild strawberry blossom out, and *Potentilla sarmentosa* in bloom; Japan quince (*Pyrus japonica*) in flower.

April 30th.—Raining in the morning; clearing with south wind all day. Black-and-white creeper (*Mneiotilta varia*); blue yellow-backed warbler (*Parula americana*); black-throated green warbler (*Dendræca virens*); redstart (*Setophaga ruticilla*), and whippoorwill all made their first appearance to-day. Saw one English snipe, and a snow-bird, (*Junco hyemalis*). Robin's nest almost completed. Columbine (*Aquilegia canadensis*) in bloom. Noticed the beginning of a caterpillar's nest on an apple tree.

E. P. BICKNELL.

Riverdale-on-Hudson, May 1st.

BIRDS OF CENTRAL NEW YORK.

(*Continued from Page* 180.)

Eremophila alpestris. Shore lark. Resident and tolerably common in winter. A few breed.

Mniotilta varia. Black and white creeper. Rare; arrives the first week in May, and departs in September.

Parula americana. Blue yellow-backed warbler. Not very common during the migration; reaches here the third week in May.

Dendræca æstiva. Summer warbler. With us from the last week in April to September. It breeds, nesting in trees and bushes.

Dendræca virens. Black-throated green warbler. Arrives the last week in April. Abundant in the spring.

Dendræca cærulescens. Black-throated blue warbler. Abundant in the spring after the first week in May, but passes north to breed.

Dendræca coronata. Yellow-rumped warbler. Very abundant with the preceding for about two weeks. None breed.

Dendræca Blackburniæ. Blakcburnian warbler. Arrives the second week in May, and goes north to breed.

Dendræca striata. Black-poll warbler. A very rare migrant.

Dendræca maculosa. Black and yellow warbler. Arrives the third week in May. It is a common spring and autumn migrant.

Dendræca pinus. Pine creeping warbler. Migrant; very rare.

Sciurus noveboracensis. Water thrush. Not common, but breeds. First seen early in May, and leaves during October.

Geothlypis trichas. Maryland yellow throat. Rare spring and autumn migrant.

Setophaga ruticilla. Redstart. Arrives the second week in May, and departs in September. It is not abundant, but breeds.

H. G. FOWLER.

NOTES FROM OUR CORRESPONDENTS.—E. O. Sage (Rochester) says that while hunting for snipe, one started up, and after circling overhead and "drumming" alighted on a tall black ash tree, where it remained for some time. He had seen snipe alight on stumps, but never on trees, which is, no doubt, an unusual occurrence....T. D. Ingersoll (Erie, Pa.,) writes that the chimney swallows made their first appearance there on May 6th, perching upon steeples in a high wind. The last seen of them last year was late in autumn, at nightfall of a very cold day, hovering by hundreds over an old house, and diving into the great square chimney. He remarks also upon the strength of this bird, considering its diminutive size. Take one in the hand and feel his struggles....A perfectly white pocket gopher (*Thomomys bulbivorus*) is reported by Dr. D. C. Estes, of Lake City, Minn. It is very large and beautiful, seems to thrive well in confinement, and will easily be tamed. It eats potatoes.

EARLY NIDIFICATION OF RUFFED GROUSE.—A correspondent writes from Greene county, Pa., under date of May 8th:—

"A young friend of mine, Mr. George Rinehart, while in the woods a short distance from this place Saturday, April 29th, walked up a grouse with a brood of young. Is not his very early for grouse to hatch?"

This is the earliest instance of the hatching of ruffed grouse of which we have heard. Many young woodcock have been already seen in various parts of New Jerse y.

—Prof. G. Brown Goode's Catalogue of the Fishes of Bermuda, of which we printed a full synopsis in FOREST AND STREAM for March 16th, has been published by the Department of the Interior as No. 5 of the Bulletius of the National Museum at the Smithsonian Institution. It constitutes a pam phlet of 90 pages.

CIRCULAR.

INTERNATIONAL EXHIBITION,
UNITED STATES CENTENNIAL COMMISSION,
BUREAU OF AGRICULTURE, PHILADELPHIA, May 1st, 1876.

SIR:—

To properly illustrate the exent of the fisheries of the United States, both in fresh and salt water aquaria, it will be necessary to have one or more specimens of all fish used for food, oil, fertilizers, isinglass, leather, bait, and other purposes, in the arts or industries.

Naturalists will also be interested in many of those forms which, although quite plentiful in certain localities, are seldom seen in market, on account of not being used as food, and as many private individuals are desirous of making donations to this department of the International Exhibition, a list of species most desirable is herein enumerated. The Fish Commissions of such States as choose to make an exhibit in the Centenoial Aquaria will of course send such species as they may deem most rare. The exhibition tanks furnished by the Centennial Commission comprise thirty-five vessels of various sizes, and about equally divided in the fresh and salt water sections, each division having in circulation about ten thousand gallons of water, which will be properly filtered, circulated, and when necessary, refrigerated. The largest fresh water tank is ten feet long by seven wide and four deep. This will accommodate any fish found in our fresh water. The great salt water tank is twenty feet long by seven by four, and will hold an eight foot fish. In the fresh water tanks we especially desire sturgeons (not over six feet), salmon, the two great lake trout, the two pikes (pickerel and muscalonge), whitefish and ciscoes, the sawyer, all the bass and perch family, the great catfish of the Mississippi, 100 pounds or more, as well as the smaller varieties, such as suckers, gars; or bill fish, and all water reptiles, invertebrates, mollusks, crustacea, and aquatic larvæ upon which fish feed at some period of their growth. Specimens of plants upon which the crustacea live, and which are suitable for introduction into fish ponds, will also be acceptable. In the salt water tanks almost any fish that will live therein is requested: Sharks, skates, and rays, the angler or fishing frog, porcupine fish, file-fish, pipe-fish, sea-horse, halibut, soles, flounders, eels, congers, sword and lace-fish, lump fish, flying-fish, sculpins, sea-robins, redfish, tautog, striped bass or rock-fish of sixty pounds or upwards, mackerel, bonito, horse mackerel, dolphins, bluefish, or salt water trout, drum, sheepshead, red snipper, perch, angel-fish, hogfish, devil-fish, lobsters, crabs, oysters, clams, sea-jellies, octopus, snails, conchs, shrimps, acemonces, madrepore, and many others. All exhibitors, or parties sending any specimens to the aquaria, will receive full credit for the same, either upon the labels, or in the catalogue and reports, or in both. Additions to the stock will be received at any time, though it is necessary full contributions should immediately be forwarded. Fish culturists are invited to send models of hatching apparatus and all appliances used by them in propagating and transporting fish, also eggs of such fishes as may be in season. Implements used to the capture of fish are also requested, that the full extent of the fishing interest may be properly displayed.

Further information may be had by addressing the Bureau of Agriculture, International Exhibition, Philadelphia, Pa.

FRED MATHER,
Supt. of Aquaria.

BURNET LANDRETH,
Chief of Bureau of Agriculture.

SHAD AS SHRIMP EATERS.

TENAFLY, N. J., May 8th, 1876.

EDITOR FOREST AND STREAM:—

I send herewith the stomach of a female shad, containing several hundred young shrimps, some whole and some partly digested, showing that they had been eaten only a short time before the fish was caught. I have never seen it mentioned that shad were shrimp-eaters. This fish was one of fifteen, and the stomaens of all contained more or less shrimps; but by far the greatest number were found in the females, sometimes only a dozen or two in the males. The fish were caught in the North River, near Fort Lee, N. J., on May 5th. I have examined some of the shrimps under a microscope, and find them to be the ordinary bait shrimp, about half an inch long, and transparent. The absence of large shrimps in the stomach almost leads one to think that the shad feed on the small fry only. Perhaps some of your correspondents have an opportunity of trying shrimp bait on a hook and line, and will report their success. I would advise them to use the smallest they can get. I expect to have a few more shad before the season closes, and will examine them and report.

A. J. HUYLER.

[Although a very noteworthy incident, it is not surprising to find that the shad which ascend our rivers come to us with their stomachs full of shrimps, for our correspondent seems to be right in his determination. It is well known that all the members of the order to which the herrings, anchovies, and shad belong, feed largely upon crustacea; and if it has never been detected before in the stomach of a Hudson River shad, it must be from lack of observation or record.—ED.]

LETTERS FROM ORNITHOLOGISTS.

DANVERSPORT, Mass., May 10th, 1876.

EDITOR FOREST AND STREAM:—

The yellow-rumped warbler (*Dendroca coronata*) is an extremely abundant spring and autumn migrant here in Essex county. Dr. Elliott Coues, in his List of the Birds of New England, says: "A few probably winter in more southern sections." Two instances of their capture in the winter have come to my notice. Raymond L. Newcomb took a specimen January 2d, 1871, and another February 25th, 1871, at Salem, Mass. As a few undoubtedly remain during the winter in sheltered localities, and instances of its breeding in Massachusetts are already recorded, should it not be termed a resident?

ARTHUR F. GRAY.

MONTPELIER, Vt., May 1st, 1876.

EDITOR FOREST AND STREAM:—

I have noticed the arrival of a few birds as follows:—

March 31—First robin seen. April 8th—Song sparrow plenty. April 16th—First flock of crow blackbirds. April 16th—Purple finches in several flocks April 30th—Heard the first white-throated sparrow. Bluebirds are very scarce. I have seen but a few for the past two years.

Yellow birds, cedar-birds, king-birds, bobolinks, and most of the warblers have not yet made their appearance, seldom doing so before the middle of May. I should be much pleased to hear reports from other parts of the State, as the season appears to me to be much later here than in some places farther north.

W. A. BRIGGS.

PEOTONE, Ill., April 30th, 1876.

EDITOR FOREST AND STREAM:—

I send you a few notes concerning the birds I have noticed in this vicinity lately, and will try and send you further items from time to time.

Robins are plentiful in summer, and have already begun nesting. Chipping, field and "ground" sparrows are abundant. Bartram's sandpiper is common and breeds, as also do the killdeer, Wilson's snipe and the quail, which last remains through the winter. The pinnated grouse (*Cupidonia cupido*) is also common in winter and summer, nesting about May 1st. The barn and cave swallows are abundant, and the yellow warbler of the gardens (*Dendroca æstiva*). There are plenty of Canada geese in spring and fall, but they do not breed. Red-winged and crow blackbirds are common. Hawks are few. As there are no pieces of woods near here of any size, many forest-loving birds are never found in this part of the State.

D. B. EATON.

MACHIAS, Me., April 23d, 1876.

EDITOR FOREST AND STREAM:—

My post-office address is as above written, but I live on Regue Island, in Englishman's Bay. This island contains about 1,400 acres. We have an abundance of game, except during two or three months in summer. At this writing we have black ducks, shelldrakes, Canada geese and brant, water wiltebes, herons, fish hawks, eagles, etc. In summer we have sandpipers in large flocks. Spruce partridges are tolerably plenty, with some woodcocks, and two years ago I put in some ruffed grouse, which are increasing. As there is a law prohibiting any one gunning on the island, I hope to be able to protect them until they become plenty. Occasionally we have a flock of wild pigeons visit us. Of late years so much shooting has been done about the island that a part of the birds fly outside in pleasant weather; but when there is a strong ont wind I am told that they are as plenty as ever. There are several nests of the bald eagle on the island, also ravens and fish-hawks. If any one should want the young of either I can get them. Occasionally a young seal is caught. The old ones are plenty at times.

GILBERT LONGFELLOW.

RECENT ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDEN.—Two young alligators, *Alligator mississippiensis*, presented by Dr. S. Weir Mitchell, Philadelphia; five water snakes, *Xerodia fasciata*; one garter snake, *Eutainia sirtalis*, presented by Joseph M. Wilson, Washington, D. C.; one great horned owl, *Bubo virginianus*, presented by J. Bailey, Philadelphia; two flying squirrels, *Pteromys volucella*, presented by Miss Mary H. Morris, Overbrook, Pa; one horned toad, *Phrynosoma cornutum*, presented by Henry Openshaw, Manayunk, Pa.; one loon, *Colymbus torquatus*, presented by John Krider, Philadelphia; two Fourniers, *bue torquatus*, presented by George W. Boyd, Philadelphia. There were six prairie wolves, *Canis latrans*, born, instead of three, as previously recorded.

Sea and River Fishing.

FISH IN SEASON IN MAY.

Trout, *Salmo fontinalis.* Shad. *Alosa.*
Salmon, *Salmo salar.* Land-locked Salmon, *Salmo Gloveri.*
Salmon Trout, *Salmo confinis.*

For list of seasonable trout flies for May see our issue of April 27th.

FISH IN MARKET.—Fish continues in abundant supply, and prices are without material change. We quote:—Striped bass, 18c. to 20c. per pound; smelts, 15c.; salmon, California, 30c., Kennebec do., 90c.; mackerel, 15c. each; shad, 35c. to 40c. each; weakfish, 15c. per pound; white perch, 12c.; Spanish mackerel, 75c.; green turtle, 18c.; terrapin, $13 per dozen; halibut, 15c.; kingfish, 25c.; cod-fish, 8c.; blackfish, 15c.; flounders, 10c.; porgies, 10c.; sea bass, 20c.; eels, 18c.; lobsters, 8c.; sheepshead, 25c.; soft clams, 40c. to 60c. per 100; whitefish, 18c.; brook trout, 50c. for Canada fish, and $1 for Long Island; hard shell crabs, $3.50 per 100, soft do., $2 per dozen.

—The leading article of this week's issue entitled "Angling in Nova Scotia," will prove of value to those who choose to avail themselves of the information it gives.

CANADIAN FISHING PRIVILEGES.

BOSTON, May 13th, 1876.

EDITOR FOREST AND STREAM:—

In your paper of May 4th you state that fishing privileges are granted for the sum of one dollar per day on the Dartmouth and Restigouche Rivers in Canada. I desire to correct a mistake which otherwise would make much trouble, both for the lessees of the rivers and parties who might take a journey to them with the expectation of being allowed to fish.

The Dartmouth is my own river, and I need only say in reference to it, that all the money in America could not *hire* a privilege on it.

The Restigouche is leased by Canadian gentlemen who feel as I do, and I have just had assurances from them that they would not *let* a privilege on any account whatever. FRED CURTIS.

In reply, as to the Restigouche, we quote from an official paper:—

"DEE SIDE, Metapedia, March 13th, 1876.

"There are seven miles of angling water here, from head of tide-water to Metapedia, open, by orders of Marine and Fisheries Department, to strangers or others, by permit, at a rate of $1 per day per rod.

"JOHN MOWATT, Fishery Officer Restigouche Division."

As to the Dartmouth River, Mr. Curtis knows that this stream has been available to strangers at $1.75 per rod per day, for several years, by permit from overseer John Eden, and, if he has recently leased it, it would have been a mark of propriety to have mentioned the fact in making his so-called "correction" of our "error." We have some readers who are only happy when they can catch us in mis statements, as they think, but we are willing to give odds on our uniform accuracy.

—The Coot Fishing Company caught 800,000 menhaden in one haul at Mattituck, Long Island, last week; the seine was a mile and one quarter long.

—The Canadian Minister of Marine has agreed to change the close season for lobster fishing, making it from August 10th to September 30th.

—Referring to the approaching contest in fly casting at the State convention, the Rochester *Express* refers to last year's winner in these terms:—"We learn that among other crack linesmen the veteran Rube Wood, of Syracuse, who has borne off the blue ribbon at the past three conventions, is determined for one to add the Fowler rod to his list of prizes won, and it is also said that Monroe Green will try his prettiest to secure it for future use in luring the wary denizens of Caledonia Creek in the direction of his reel. Seth Green, a terror among rod slingers, has not taken part in the exercises for several years, he having been barred from participating on the ground of his being a 'professional.'"

MASSACHUSETTS—*Taunton, May 8th.*—An immense run of herring has filled the Taunton and Nemasket rivers so full that one sweep of the seine filled the wagons, and left thousands on the ground. The fishways at East Taunton are a solid mass of struggling fish. Fishermen are at work, but the fish are too numerous for profit. VON G.

CONNECTICUT—*Higganum, May 10th.*—Shad are plentiful now. The nets used are about sixty rods long, fifty meshes deep, (five and a half inch mesh.) They drift a distance of from one and a half to three miles. There are ten or twelve nets in this place, and a great number of shad are caught every season. Last week about 800 were taken. The warm weather last Saturday and Sunday—May 6th and 7th—with rain, caused the river to rise, the muddy water giving the fishermen a chance to fish during the day as well as night, and yesterday and to day each net is taking from twenty to sixty a drift, and as they make about four drifts a day you may suppose the river to be pretty full of shad, although in a day or two they may not take half of that number, as the fish go in schools, or "spurts," as we call it. The fishing is mostly done at night, as the water has to be very muddy for day fishing. Most of the shad are sent to Hartford, and sold at $16 per hundred; for the season's catch last year they were $18 and $20.

CHAS. O. G.

ALABAMA—*Huntsville, May 2d.*—I was invited to join the fishing club of this place on a trip to Wood's Mill, on Flint River, fifteen miles from here. We arrived at the fishing grounds about noon last Monday, and remained until Wednesday. The water was most too clear and too low, although we had pretty fair luck, catching as many as we could eat, and each man (there were twelve of us) brought home about two and a half or three pounds of fish. The largest fish caught was a black bass, seventeen inches long, and weighed three pounds. I measured and weighed another, eleven inches long and three quarter pounds weight. According to the table published in FOREST AND STREAM April 13th, showing the weight of English fish to a given length, the large bass was heavier than either the trout, grayling, or pike. The smaller one compared very well. There are some fine fishing streams in this State. Flint River, Short Creek, above Guntersville, Swan Lake, just opposite Decatur, and others, which I hope I may have a chance of reporting upon from personal experience.

W. G. W.

NOVA SCOTIA—*Chester, May 9th.*—A catch of forty-two trout was taken at Hubley's Lake, St. Margaret's Bay, Saturday last by three gentlemen, who report the lake to be absolutely swarming with trout. They "fished till they were tired." The fish ranged in weight from one to three pounds. K.

MOVEMENTS OF THE FISHING FLEET.—The number of fishing arrivals the past week has been 46, 39 from Georges and 7 from the Banks. Receipts, 1,092,000 pounds Georges codfish, 124,000 pounds Georges halibut, 510,000 Bank halibut, and one salt fare from Grand Bank. Fresh halibut has sold readily at 2½ and 3 cents per pound for Bank and Georges white, and 1½ cents for gray. There is a better feeling in the codfish trade, and prices reached bottom at $4.50 per qtl. for Georges, and $3.50 for Bank. None are now offering at these prices, and it would be difficult to fill an order below $4.75 and $3.75. The Shore fleet have had unfavorable weather and a light catch, and fares have sold readily. We notice sales yesterday at $1.75 per hundred pound for cod, and $1 for haddock.—*Cape Ann Advertiser, May 12th.*

LOBSTERS.—It is to be hoped that the Minister of Marine and Fisheries, who is now in the city, will see his way clear to the repeal of the law respecting lobsters. The proper plan would be to have no law at all this year. In the meantime let the fishery officers along the coast institute close investigation into the habits of the lobsters—into the time when the soft shell lobster first puts in an appearance. The Challenger, in the course of her investigations on this coast, found that just outside the harbor of Halifax a very cold polar stream flows from the north and east past the Atlantic shores of Nova Scotia—not more than eighty fathoms below the surface. As the ocean becomes warmer, this polar stream of ice cold water becomes heated, the warming process beginning at the western end and running along east. This fact points to the presumption that one close season for Nova Scotia will be an absurdity. The proper plan would evidently be to divide the coast into sections, having a different close season for each. It is well known that the soft shell lobster does not make its appearance on the Cape Breton shore till some time after it shows itself in Halifax county. So that when the time is suitable for a close season in this county the lobsters of Cape Breton are just in their prime.—*Halifax (N. S.) Reporter, May 10th.*

WHERE TO CATCH BASS IN PENNSYLVANIA.—Mr. John A. Freas, of the Germantown *Telegraph*, has obliged us with a concise answer to our question, where to catch bass in Pennsylvania. As some of our readers may desire to wet a line when they visit the exposition, they will feel grateful for the information:—

GERMANTOWN, Pennsylvania, May 8th, 1876.

EDITOR FOREST AND STREAM:—

In reply to some inquiry, I would say that the majority of our readers being within easy reaching distance of the Schuylkill, go to that river when they desire to fish for black bass. According to the law now in force the close season ends June 1st, and the fish can be legally taken during the summer and fall in any river of this State, with rod and line. The best points, perhaps, along the Schuylkill for bass are the vicinities of Conshohocken, Norristown, Phœnixville, and Pottstown. Trains on the Reading Railroad go direct to these places several times daily from the Centennial grounds as well as from the regular depots. During warm weather the bass feeds at sunrise and sunset. When engaged in the pursuit of minnows, say from four to six in the morning and from six to eight in the evening, are the best times for the angler. Many are taken with the fly, and artificial minnow and eel. Live crawfish and minnow, however, are generally the most attractive bait in the Schuylkill and upper Delaware.

The vicinity of Easton, where the bass were originally introduced into the Delaware in 1870, is one of the best localities on that river to take them. There are several trains daily from this city for Easton over North Pennsylvania Railroad. There is fair fishing in the Susquehanna at Harrisburg, Duncannon, and other points, but the bass as yet are not as numerous in that river as in the upper Delaware.

Perch fishing in the Delaware, near this city, is not the pleasant sport it was twenty years ago. The almost constant seining of the river during the spring has sadly decreased the number of this game fish, and it is but rarely of late years that a specimen is taken weighing as much as a pound. Many, however, indulge in angling for them at Gloucester, four miles below the city, and at Pridesburg, six miles above, where batteaus are kept for hire. Earth worms are always used for bait. Small Limerick hooks are considered the best.

ANGLING RECOLLECTIONS.

PHILADELPHIA, April 24th, 1876.

EDITOR FOREST AND STREAM:—

The fishing season is here, and the hands that so lately wielded the pen in defence of inside or outside enamel, or to uphold pet theories as to strength and elasticity, will now grasp the bamboo or greenheart and find pleasanter occupation in putting a trout at the end of every line, than distributing commas or periods. To those who cannot get away early in the season is left the choice of anticipating in imagination the sport they shall have later, when time can be spared to cut loose from business, or going over with memory's help the exploits of former years. The latter is to me the more profitable of the two, as the one seems at the least only idle speculation about what may end eventually in disappointment, while the other brings back by-gone reality, and I can see in the mistakes of the past what to avoid in the future. There are people to whom the actual fishing is the smallest part of the pleasure, of which the greatest is found in looking over their tackle, inspecting new rods and patent reels, and arranging fly-hooks. Give a poor workman the best of tools and he will make but a notch of his job at best; but give a real fisherman—one who has the natural gift, a fisherman born, not made—any sort of tools or chance and if trout are to be had he will have them.

In fishing, as in many other pursuits, whether work or play, a little common sense goes a long way, and this I have more than once demonstrated practically, at least to my own satisfaction.

Some years ago I spent a few weeks of the warm weather at a little village in Western New York. There were several small streams in the neighborhood, and I asked one of the natives one day if there were any trout about.

"Not now," he said; "there's trout in the run early in the season. Sometimes folks catches pretty good strings, but, dear me! 'taint any use to go there now; the fish have all been caught out long ago. There ain't less than two or three parties up there every day as long as there's a trout in the water."

I thanked him for his information, and a day or two after started for the run, about four miles from the village. I had a bait rod and carried some bait with me besides my flies. The day was a perfectly clear and hot day in July; warm even at 8 in the morning, when I began fishing. The run was a small stream, and at the point I struck it ran into a mill-pond, below which were no fish, so that I had either to fish up stream, or walk up and fish down. I chose to fish up stream, and began work with flies. I soon found that there were trout in the stream, but very wild, and had to persuade. The stream ran mostly through open fields, so that there was neither shade nor cover. I fished along with varying success, using sometimes flies, then occasionally bait, either worm or grasshopper, and began to have a respectable show in my basket, when I came to a place where the run ran through quite a patch of brush, and the banks were so thickly set that it looked like a very doubtful sort of operation to follow the stream up, let alone the fishing. I stopped and thought a little before I went on. Here was probably where the trout were. The natives would fish along where the banks were open until they came to the brush, then walk around that, get beyond it, and go on fishing, so that here ought to be an undisturbed piece of water. While I was thinking this over I heard not far above a sudden plunge, evidently a trout taking a grasshopper, and apparently, to judge from the sound, a big trout, too. I jumped up and started to look up this active fellow. A little way up stream I parted the bushes, and peering through the interlaced limbs, I saw a pool surrounded by an impenetrable wall of brush. At the lower end of this pool, which was smooth, and had not much current, was a log square across the stream, and on the dark surface of the water, as it rippled against the upper side, floated a few foam flakes and bubbles. A delightful retreat for a big fellow tired of the worry and excitement of the constant whipping of the stream below. I looked a moment and drew back. The trout that lived in that pool must be an aristocrat, and so had he secluded himself that I concluded he would move only at such offers as suited him, so I cast about me to find a bait that might please him—what the old Greeks used as the emblem of his class—the grasshopper. I soon caught one, put it on a hook, and using only the upper two joints of my rod, I held them as high as I could over my head, keeping them at the same time nearly horizontal, while with the other hand I cast the grasshopper over the brush, and as luck would have it just in the proper spot. As it touched the water there was a rush, a swirl in the water, and a stroke of a broad tail as I struck and hooked a good fish. There was little room for play with this fellow. I was holding my rod up at arm's length over the top of the brush, and could not see very much of the water, although close to it. The fish tired of it before I did, and I put him in the basket. He weighed a pound that afternoon when I got back to the village and put him on the scales. The natives were very much astonished at the sight of such a basket of fish as I took home that day, caught so late in the season. Where had I been? How bad I fished? What bait did I use? etc. I was asked fifty questions about it. Several parties forthwith started up to the run to fish, but I did not hear of much success, probably because, setting aside the mode of fishing, they most likely confined their fishing to the open banks and easy work, whereas a little common sense would have led them to look in the shade and cover for trout at that season of the year and such a day.

I went several times to this run while I was in the vicinity, and always caught a good basket of fish by fishing where the fish were, and not wasting time in idle whipping of the empty water.

A few days after my first expedition I drove over to Pike Creek, some fifteen miles off, taking with me a young cousin, a novice in the art of trout fishing. The hotel landlord where I put up my horse, talked learnedly about flies, etc., and was anxious to advise me, but I paid little attention to him. This creek was a much larger and better stream than the other run, and had some good trout in it. By hard labor, and carefully working one or two pieces of woodland through which the stream ran, as well as changing flies constantly, and from those to bait, we caught 96 fair trout, a result at which I confess I was surprised myself, when we came to turn them out of our baskets for the landlord's inspection. We could not convince him that we had not bought some of them—X, Y, and Z had all fished there, and used flies and that fly, but no such mess of fish had been caught that season. I tried hard to convince him that more common sense and application would be better than so much implicit belief in particular kinds of flies or makes of rods. The man has more to do with it than the tool. A good fisherman will catch fish with almost anything you can give him; but a poor one can do nothing, no matter where he has the enamel on his split bamboo. I think I may safely say "you know how it is yourself."

C. C.

THE FROST FISH OF BROWN'S TRACT.

BOONVILLE, May 1st, 1876.

EDITOR FOREST AND STREAM:—

Noticing in April 6th issue an allusion to the so called frost fish of Brown's Tract, I will give you a description of them: They are found in lakes contributing to the St. Lawrence River; length, from ten to sixteen inches; weight, from eight to 16 ounces; head small; mouth very small; lips long and too'thless; eyes protuberant; scales round; second dorsal rayless, as in salmon family; flesh white and firm; food succulent. A row of black spots on each side, not noticeable until the scales are removed. Do not take bait or fly; caught on spawning beds with seine or net. Spawn from November 1st to November 20th.

JACK SHEPHERD.

LITTLE FALLS, N. Y., May 4th, 1876.

EDITOR FOREST AND STREAM:—

The "trout fish" you speak of is, I believe, common to all our northern lakes. Those I have seen are usually from one-half to three-quarters of a pound in weight, though I picked up one on Pisco Lake floating dead on the surface, which weighed one and a half pounds. They are of the *Salmonidæ*, and are very similar to the Otsego (not Oswego) bass, and to the common whitefish of the great lakes. The only place, so far as I know, where they have been taken in any quantity, is on the "Fulton Chain," in the stream connecting Fourth and Fifth lakes and Sixth and Seventh lakes. There they used to be taken in weirs built out into the stream. "Old" Arnold used to catch them and cure them like herring for winter's use. I have seen them at his house in the spring strung on sticks, salted, dried, and I believe smoked. They are highly esteemed, preferred above trout, by those who know them, and as they never take a hook, either bait or fly, and are never seen except late in the fall, when they run up the streams to spawn, very few persons, other than old residents, have seen them. They are a very near relative of the Otsego bass and whitefish, if not identical with them. The general build, the colors and markings of the three are quite similar.

WATT T. LOOMIS.

AN INTELLIGENT POINT.—A correspondent writes that he had a pointer bitch fourteen months old in the field with her own pup, four months and one day old. The mother dog pointed a covey of birds, the pup came up on a line with his mother, and was in the act of advancing on the birds when the bitch ran back suddenly to attract his attention and arrest his advance. The mother then returned and pointed again; the pup again promptly advanced to the side of the mother, and was in the act of going in on the birds, when the mother turned her head arresting the pup in the bend made by her head and neck. The pup finding himself stopped reared with his fore feet on his mother's shoulder and got wind of the birds, when both stood in that position for some time. The bitch, which I still own, is a medium sized white and liver, very active, nervous and with muscles like iron. She was whelped December 15th, 1868, and the pup on October 14th, 1869. The latter made his first point February 15th, 1870. Mother got by a Baltimore dog out of a Luzerne County, Va., bitch.

J. K. R.

IMPORTANT.—Care should be taken, in buying Fishing or Hunting Suits, to get a genuine Hubbard Suit, and not one of the worthless imitations which are being put on the market. The best is the cheapest.—Adv

National Pastimes.

POLO.—This game, a description of which was recently printed in our columns, has now been fairly inaugurated in this country by the Polo Club, of which Mr. James Gordon Bennet is the leading spirit, and matches or practice games are played weekly on the grounds of the club adjoining Jerome Park. At the match on Saturday last Lord Mandeville and Sir Bache Cunard were respectively captains, and chose their sides as follows:—

Lord Mandeville,	Sir Bache Cunard,
Mr. Bennett,	Mr. Howland Robbins,
Mr. Leatham,	Colonel William Jay,
Mr. Schuyler Crosby,	Mr. Gissele Jay,
Mr. S. S. Howland.	Mr. Perry Belmont.

The space staked off for practice is about 400 feet long by 250 wide, and is enclosed by tall white poles, at distances of fifty feet from each other. At each end of the grounds are two poles, twenty-five feet apart, each bearing a small flag. These are the goals through which the ball must be driven in order to obtain a victory. The only weapon used is a mallet from five to six feet in length, with a wooden head not unlike that of a hammer. With this the player must strike a light wooden ball, of the size and shape of a base ball, and drive it through the goal of the opposite party. The players are mounted on wiry little mustangs brought from Texas, which, although well adapted for the purpose, are still as new at the game as their riders. Both horses and men received some hard pounding in the scrimmage which followed the efforts of either party to drive the ball past their opponents' goal. Three games, or innings, were played, in the first of which the Cunard side were successful, Lord Mandeville's party winning the second. The third and last was won by the same side, after some capital playing.

BICYCLING.—David Stanton, of England, and William Butler, of Kentucky, were the contestants in a fifty mile bicycle race at the Rink on Monday evening. The stakes, $600, were easily won by the Englishman, Butler giving out through a sprained knee on the twenty-seventh mile. Stanton made the fifty miles in 3h. 9m. and 15s; his fastest mile being the twenty-eighth, done in 3m. 35s. There is no doubt that Stanton is the best bicyclist in this country, if not in the world.

UNIVERSITY OF PENNSYLVANIA ATHLETICS.—The spring contests of the Athletic Association of the University of Pennsylvania were held on Saturday last, on the private track of Mr. Robert Steele, Limekiln pike, Germantown. The results obtained were highly satisfactory, excelling in almost every instance the results of last fall's contests, and equalling in many the results of other colleges. The first event, the 100 yards dash, was won by W. J. Kelly, Jr., '76; time, 10¼s. The second event, the standing jump, was won by W. H. Willoughby, '77; distance, 9ft. 8in. The third event, throwing the hammer (nine pounds), was won by H. L. Willoughby, '77; distance, 79ft. 7in. The fourth event, the three mile walk, was won by Ernest Law, '77; time, 24m. 9s. The fifth event, the running high jump, was won by A. W. Biddle, '76; height, 5ft. 3¾in. The sixth event, throwing the base ball, was won by H. W. Andrews, '76; distance, 349ft. The seventh event, the running long jump, was won by H. L. Willoughby, '77; distance, 16ft, 11in. The eighth event, the hurdle race (100 yards), was won by A. W. Biddle, '76; time, 12¾s. The ninth event, the running hop, step, and jump, was won by H. L. Willoughby, '77; distance, 38ft. 1in. The tenth event, the one mile running race, was won by Addinell Hewson, Jr., '76; time, 5m. 29s. The Judges were as follows:—C. Penrose Bligh, '76; G. Stanley Fuller, '77; J. Curtis Patterson, '78; S. Hockley Walsh, '79. Timekeepers—J. Curtis Patterson, '78, and S. Hockley Walsh, '79. Messrs. Gezelin, Law, Willoughby, Audrews, and Hewson will probably go to Saratoga the coming summer to represent the University in the intercollegiate athletic contests. A swimming match, under the auspices of the association, will be held Saturday, June 10th, 1876.

BASE BALL—THE PROFESSIONAL ARENA.

—The question as to whether the Western clubs should visit the East first, or *vice versa*, has been settled amicably through the efforts of Messrs. Hurlburt and Cammeyer, and the Western quartette of the League clubs are to visit the East on May 23d, playing in this section of the country every Tuesday, Thursday, and Saturday—at Philadelphia, Brooklyn, Hartford, and Boston on those days in the order in which the lots they may draw may decide. Thus far the Western branch excels the Eastern in the play exhibited in the games each have played together, and the probability is that the West will carry off the honors in the coming trials of skill here in the East. Thus far Chicago heads the list of the League clubs, Hartford being second, with St. Louis third and Boston fourth, Louisville being last, as the appended record shows:—

	Chicago.	Hartford.	St. Louis.	Boston.	Athletic.	Cincinnati.	Mutual.	Louisville.	Games won.
Chicago	..	0	1	0	0	3	0	4	8
Hartford	0	..	0	2	2	0	2	0	6
St. Louis	1	0	..	0	0	1	0	3	5
Boston	0	0	0	..	2	0	2	0	4
Athletic	0	0	0	1	..	0	3	0	4
Cincinnati	0	0	2	0	0	..	0	1	3
Mutual	0	1	0	1	1	0	..	0	3
Louisville	0	0	1	0	0	1	0	..	2
Games lost	1	1	4	4	5	5	7	8	35

The games in the arena since our last have been as follows:—

May 8—Chicago vs. St. Louis, at St Louis	3 to 2
May 8—Mutual vs. Boston, at Boston	5 to 1
May 8—Hartford vs. Athletic, at Philadelphia	7 to 4
May 8—St. Louis vs. Louisville, at St. Louis	5 to 0
May 10—Chicago vs. Cincinnati, at Chicago	6 to 0
May 11—St. Louis vs. Louisville, at St. Louis	9 to 0
May 11—Athletic vs. Mutual, at Brooklyn	6 to 5
May 11—Chicago vs. Cincinnati at Chicago	9 to 5
May 13—Chicago vs. St. Louis, at Chicago	4 to 2
May 13—St. Louis vs. Cincinnati, at St. Louis	11 to 0
May 13—Boston vs. Athletic, at Boston	19 to 11
May 13—Hartford vs. Mutual, at Hartford	28 to 3

This is an unusual array of single figure games, and shows marked improvement in play, the West, as in the week previous, bearing off the palm. The poor games of the week were three of the four played on Saturday in St. Louis, Boston, and Hartford.

—Why the St. Louis club lost so many games on their tour is thus accounted for by the Louisville *Courier-Journal*, which says that, "in the first place, there are several dissolute players in the nine, and as these men seem to consult their own inclinations, and act as they see fit, without any perceptible restraint to govern their own conduct and actions, nothing much need be expected until this is remedied. Present conduct justifies the belief that it is modeled from that in the past, and we most emphatically state that a nine, the majority of whose players spend their nights in carousing and playing cards until after two in the morning, are not fitted for good work on the ball field." The incompetency of the management which would allow a condition of things like this to exist in a stock company professional team deserves the penalty of such a series of defeats as the St. Louis club has sustained. After their Waterloo defeat in Louisville, no doubt the St. Louis combination deemed it advisable to adopt reformatory measures, and hence the victory of the 5th inst.

—The Harvards gave the Reds a good push last week, but the Yales were easily taken into camp by the New Havens.

THE AMATEUR ARENA.

—The principal contests of the amateur arena this season are those in which the College clubs take part, as the great majority of the other clubs not in the regular professional arena are not properly amateur organizations, but simply gate money, or co-operative clubs. Glancing over the record of games in which the College club nines have participated up to May 15th we find the following as among the most noteworthy:—

April 13—Harvard vs. Lowell, at Lowell	3 to 1
April 19—Boston vs. Harvard, at Boston	6 to 2
April 22—Harvard vs. Yale, at New Haven	3 to 2
April 27—Harvard vs Live Oak, at Lynn	14 to 9
April 29—Harvard vs. Live Oak, at Lynn	9 to 8
May 4—Boston vs. Harvard, at Boston (11 innings)	4 to 3
May 5—Harvard vs. Suffolk, at Cambridge	8 to 1
May 6—Charter Oak vs. Trinity College, at Hartford	2 to 1
May 6—New Haven vs. Yale, at New Haven	10 to 5
May 8—Full River vs. Brown University, at Providence	3 to 1
May 10—Trinity College vs. Charter Oak, at Hartford	7 to 5
May 10—Harvard vs. Taunton, at Taunton	11 to 1
May 10- Live Oak vs. Brown University, at Providence	8 to 6
May 10—Yale vs. Nucleus, at New Haven	18 to 2
May 10—New York University vs. Fairbanks, at Evanston	16 to 1
May 11—Boston vs. Harvard, at Boston	12 to 0
May 11—New Haven vs. Yale, at New Haven	9 to 3
May 13—New Haven vs. Yale, at New Haven	6 to 1

It will be seen that out of eighteen games, thirteen were marked by single figure scores by the winning nines, a record showing very fine fielding and effective pitching.

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

KANKAKEE, Pittsburgh.—Can you inform me who to get a first-rate well-trained water retriever? Ans. From Mr. J. H. Whitman, Chicago.

JOHN, Ayer, Mass.—Will you please inform me through your paper what you can furnish me a setter dog pup for, one that is six months old, pure blood and all right? Ans. $25.

A. S. A., North Adams.—Will you please inform me where I can obtain Nordhoff's book on Southern California, also cost of same? Ans. From Messrs. Harper Bros., the publishers; price $2.50.

N. B., Georgetown, D. C.—Where can the Beach sights for rifles be procured, and what is the price? Ans. From almost any of the gun or rifle dealers advertising in our columns; price $2.50 each.

G. M., New Haven, Ct.—In what number of your journal is the paper by Seth Green which tells how to angle for lake trout? A party of us put 10,000 in a pond near here three years ago, and now would like to know how to ascertain if they are yet there? Ans. March 19th, 1876.

J. A. B., Arlington, Mass.—My dog, a small terrier, was bitten by a large Newfoundland dog, and one eye pulled out so that it lays on the side of his head towards the ear. I tried to put it back, but cannot; can I cut the eye off, or must I kill him? Ans. Cut the eye off and your dog will be but little the worse for it, except in looks.

NORFOLK, Paducah, Ky.—Can you get good grouse shooting by going to Shawneetown, Ill., fifteen miles from Uniontown, Ky., and there taking the Springfield Railroad for Pana, or some point thereabouts? Ans. By going to Beardstown, on the same road, he can have unsurpassed fowl shooting; excellent partridge (quail) shooting in Union county.

J. E. D., New York.—Are either of the pictures you advertise of Irish setter dogs Dash, Bess, Dick, of the stock of C. H. Turner, St. Louis, and if not, are there any copies of any of his dogs out and the price, or where can I get them? Ans. No; the only pictures of Mr. Turner's dogs that we have seen are those printed in the *Rod and Gun* and Chicago *Field*.

J. H. H., New York.—Will you please inform me if the Hudson or North River affords good fishing, or whether the Sound is as good a place or better, and if the latter part of this month and first part of next month is as good a time of the year as any? Ans. There is good fishing in both the Hudson River and the Sound, but the fall of the year is the best season.

C. E. W., St. Marys, Ga.—Is there any market for alligator skins in New York, and if so, what are they worth? Ans. There is a market for green alligator skins in this city, but the price depends entirely upon the size of the 'gator and the manner in which it is skinned. A skin from nine to twelve feet in length will bring about $2.50, while smaller ones range anywhere from 60 cents.

H. S. G., Boston.—Can you inform me whether good fly-fishing for trout is still to be had in Elk County, Pennsylvania, and if so, how to reach the most desirable points; also probable cost, and whether the 1st of June would be a good time to go? Ans. Trout Creek, Straight Creek, and Clarion Creek are good trout streams in Elk County. June is as good a month as any. Take Pennsylvania Railroad.

GAME LAW, New York.—I shall be in the neighborhood of Port Jefferson, L. I., in a week or so, and beg you will kindly inform a novice whether he can shoot at (I don't say kill) any game he may come across? In plain, I know nothing of the game laws in that part of the country, and look to you for enlightenment. Ans. The only birds you can kill are bay or shore birds until July 4th, when woodcock shooting commences.

C. M., Philadelphia.—Please inform me where I will find a good dog breaker, and one who will board dogs and keep them safely and in good condition out of season? Address Horatio Vanschoick, Pennington, Mercer county, N. J., who is a very skillful breaker, and has ample accommodations for safely keeping dogs, at reasonable rates, and we take pleasure in recommending him to our shooting friends. He will break dogs to retrieve.

TYRONE.—Please inform me what a fresh water sheepshead is. I saw mention made of them only recently. Where can they be caught? Ans. There is a fish called sheepshead found in Onondaga Lake, and other waters in Western New York, known to naturalists as *Corvina oscula*, and we have heard of sheepshead in Southwestern waters, which may be the same species, but of this fact we are not fully informed and would ask for more light.

LACHINE, Montreal.—Will you be so good as to inform me as to to the merits of the "Boudren reflecting jack and fishing lamp," for spearing purposes; whether it answers the purpose as well as the ordinary "jack" burning pine knots or the branch of cedar faggots—the latter are usually employed about here? Ans. People who have used them extensively in Florida the past winter, speak very highly of them, and as far exceeding the old "jack" for fishing, shooting, or camp purposes.

DOUGLAS, Orange, N. J.—1. Will you oblige one by stating where I would be likely to get trout to stock my ponds, and at what probable expense? 2. Also can you recommend me some place good for fishing and hunting in the month of June or July? Ans. 1. You can get trout from Milton P. Peirce, Wenonah, Gloucester Co., or from Mrs. J. H. Slack, Bloomsburg. 2. There is good fishing at Murdock's and near Moreton, on the Oswego Midland Railroad, and other points along the line.

HAWKER ON SHOOTING.—"Dieselne" informs "R. L. W." that Capt. Heath, 16 East Fourth street, Cincinnati, has for sale an excellent copy of Porter's "Hawker." This scarce book is entirely out of print. Some months since, when the Minnesota Historical Society wished a copy, they were entirely unable to procure it through the booksellers who usually supplied their scarce books. Compared with Porter's the English edition, which is readily obtainable, seems to be of little value for the American reader.

G. T. W., Saratoga Spa.—I have a pointer pup about four weeks old; would you advise me to have a portion of his tail amputated. There is a doubt or difference of opinion among our few sportsmen here on that question, consequently will leave it for you to decide; also what age the animal should be before the operation is performed? Ans. Without seeing your pup it would be difficult to say if any or how much should be taken off the tail. Some pointers are much improved in appearance by taking off a small piece, and the sooner it is done the better.

J. L., Galveston, Texas.—I have bought a steam yacht, which I run here on the fishing banks. Am I liable for accidents when in compliance with U. S. laws? Have State laws anything to do with it? We carry passengers for hire. When will new law pass? Ans. If your boat is enrolled and licensed, and you have a captain and engineer with proper certificates, and also inspection certificate you are all right. We know of no State laws affecting you, except so far as a license may be concerned, nor do we know of any contemplated change in the laws.

C. L., Chester, Vt.—1. Please advise how to care for the inside of gun barrels so they may be kept from rusting during a few months' abscence. Had thought to fill with oil and stop tightly. If this plan is advisable, what oil is best? 2. I want some best and finest trout line for hook fishing; what do you recommend? 3. Can the Kay concentrators be used in metallic shells, and can they be obtained of dealers in small quantities, say one dozen? Ans. 1. Use Belmontyle oil for the inside of your gun barrels, and plug with wads. 2. Get the finest water-proofed laid silk lines. 3. Yes; to both queries.

J. F. L., Savannah, Ga.—1. Is there a book published that treats of arms of all kinds, rifles particularly, giving descriptions of their various qualities, styles, and adaptability to different kinds of shooting? 2. How does the new Ballard rifle compare in strength and accuracy of shooting with the Remington, and are the improvements in the extractor and firing-pin really good? Ans. 1. There are several works treating of rifles of all kinds, notably, Mr. W. W. Greener's "Breech-loaders, Sporting and Military," Mr. Dougal's book of a similar nature, Stonehenge's "Shot Gun and Sporting Rifle," and many others. 2. The Ballard is an excellent rifle, and the improvements are so in fact.

DOCTER, Portland, Me.—1. Is it required of an owner entering a dog at a Bench Show to specify the classes, or could this be left in the superintendent or judges? The owner giving such information (such as age, whether previously entered at a Bench Show, &c.,) as would enable the judges to decide for what classes it would be eligible? 2. Would a dog, entered with no pedigree given, have much chance to win upon its own merits when competing with dogs of published rose-colored pedigrees? Ans. 1. The printed form requires you to name the class, although if you were sending a dog, and had no catalogue, the Superintendant or Secretary might place him for you. 2. Pedigree is not considered in judging, except in the event of a tie.

GREEN LINE.—What Jersey Flats do you refer to in this week's paper for bass fishing? where located and how reached? Ans. Down the harbor and off the Jersey shore nearly abreast the old yacht club house. It is a hard ground to navigate for one not posted. By June 1st it will be bonyed out, and we will give distances and bearings. 2. Will spring bass take spawn bait? have tried it four times this season on the Hudson without success. Used shrimp this week with indifferent success. Ans. Yes. Whereabouts on the Hudson? 3. When using spawn must it be used with float, or on the bottom with sinker? Ans. Use a float, and twist your spawn around the shank and bend of the hook. Tie it with a string, and let it hang 18 inches below the float.

W. H. S., Philadelphia.—1. Do you consider the Dittmar wood powder as good in every way as the black? 2. Is the Dittmar powder any more likely to burst a gun than the black, and would you advise its use in a muzzle-loading rifle? 3. Can the Dittmar powder be rammed as hard as the black without danger, and is it as safe? 4. Do you use the same size charge for the Dittmar as for the black, and do you load the same? Ans. 1. We have not given the Dittmar powder a thorough trial, but have met with skillful sportsmen who speak very favorably of it, some who prefer it to black powder. 2. We consider it safe for use in any kind of gun or rifle, if used properly. 3. Yes; but it should not be rammed hard. 4. Use the same quantity by measure, and load the same as with black powder.

G. M. FAIRCHILD.—Some trout which I caught in Canada, this winter, were covered with parasites of a most repulsive kind; they resembled a leech, with this difference, that they adhered to the fish by means of innumerable suckers. The trout were shiny and so poor that we threw them away. What is the name of the parasite? Ans. It is hard to say. It may have been a leech unfamiliar to you, which are often found upon trout and other fishes in large numbers. It may also have been a flat-worm (*Planaria*) which inhabits fresh water, and adheres to fishes. Certain small crustaceans also bury portions of their bodies in the flesh of fishes and are thus carried about. Write a more circumstantial description, or send us a portion of the fish with parasite attached, in strong spirits, if you feel further interested, and we will endeavor to identify it. It is an obscure subject, however, requiring experience and good instruments to properly handle.

W. P. C., Brooklyn.—1. What fishing and shooting is to be had in Montcalm County, Michigan? 2. Which kind of rifle would be most useful there, and what the proper size bore? 3. Having a 10-bore breech-loading gun, would I need a rifle? 4. Have you any good second-hand sporting rifles for sale? 5. I notice that the paper shells I use, after being discharged, are crushed, just as if you took one in your hand and squeezed it; what is it caused by? 6. Can you tell me where an invalid with wife and child can get board in a private family in a country place in the mountains for four or five months from June 1st? Ans. 1. We do not know, but perhaps some of our correspondents will give the information. 2. Any good rifle of .44 calibre. 3. The shot gun should be sufficient; use concentrators with buckshot for large game. 4. No. 5. The trouble arises from the diameter of your gun being too large for the shells; it can be bushed. 6. Write to Philo Peck, Catskill, Greene county, N. Y.

W. A. M., Jacksonport, Ark.—1. How is swansdown bought and sold, by weight or otherwise? 2. How much would a good skin be worth? 3. Give the name of some reliable dealer? 4. I want a dog for general hunting purposes, quail, prairie chickens, squirrels, snipe, plover, ducks, geese, and rabbits. The great need being for a good retriever from land and water, and deep mud, but other good qualities, such as finding the game, pointing it, &c., not objected to. Neither the pointer or setter fills the bill. What breed should I buy? 5. Is the Simmon's suit advertised in your columns made water-proof by the Tappan process? If not, is there any suit that is? Ans. 1, 2, and 3. Swansdown is retailed by the yard after being cut in inch strips, but is purchased by the dealers by the dozen skins. It is brought from the North of Europe where its preparation is an art in itself. Dealers here say that they would not buy American skins, as they would not be sure of their being properly cured. The price ranges from $20 to $80 per dozen. 4. A chamber spaniel should, we think, answer your purpose. 5. We do not know whether it is or not, but the Thomson's suit we do know is,

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCULCATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,

[POST OFFICE BOX 2832.]

123 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty-five per cent. allowed for five copies and upwards.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent.; over six months, 30 per cent.

NEW YORK, THURSDAY, MAY 18, 1876.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Editor.

WILLIAM C. HARRIS, Business Manager.

CALENDAR OF EVENTS FOR THE COMING WEEK.

THURSDAY, May 18.—Racing: Louisville, Ky., and Washington, D. C. Mustang race: Fleetwood Park. Trotting: Suffolk Park, Philadelphia. Spring Meeting American Rifle Association, Glen Drake. Centennial Billiard Tournament, Philadelphia. Base ball: Chicago vs. St. Louis, at Chicago; Cincinnati vs. Louisville, at Louisville; New Haven vs. Hartford, at New Haven.

FRIDAY, May 19.—Racing: Louisville, Ky., and Washington, D. C. Trotting: Suffolk Park; Philadelphia Spring Meeting. American Rifle Association, Glen Drake. Hurdle Races: Warrenton Riding Club, Warrenton, Va. Base ball: Hartford vs. Athletic, at Hartford; Resolute vs. Mutual, at Elizabeth; Boston vs. Athletic, at Boston.

SATURDAY, May 20 —Racing: Louisville, Ky. Rifle: Geiger Bullseye Trophy, and 7th Regt. "shells," at Creedmoor; Spring Meeting American Rifle Association, Glen Drake. Base ball: Brooklyn (prof.) vs. Resolute, of Elizabeth; Boston vs. Mutual, at Brooklyn, E. D; Resolute vs. Brooklyn, of Brooklyn, at Elizabeth; Chicago vs. St. Louis, at Chicago; Cincinnati vs. Louisville, at Louisville; New Haven vs. Athletic, at New Haven; Mutual vs. Boston, at Brooklyn.

MONDAY, May 22.—N. Y. State Sportsman's Association, Geneseo, N. Y. Rifle Shooting: Union Hill, N. Y. Base ball: Arlington vs. Star; at Newark, N. J.

TUESDAY, May 23.—Racing: Baltimore. Trotting: Point Breeze Park, Philadelphia. Rifle: Matches at Union Hill, N. J. Base ball: Orange vs. Mutual, at Orange, N. J.

WEDNESDAY, May 24.—Racing: Baltimore, Cincinnati, and Toronto, Canada. Trotting: Point Breeze Park, Philadelphia, Lancaster, Ohio. Scranton Rifle Club Meeting, Scranton, Pa.; Union Hill, N. J.

—Now that the yachting season is at hand we would call attention to the advertisement of yacht builders in our columns. At the Thousand Islands, especially, and at many other frequented summer resorts small steam yachts are in great favor, the winds on inland waters being variable and unreliable for sailing craft.

—Every one who wishes his lawn cut neatly and with dispatch should visit the establishment of R. H. Allen, 189 Water street, this city, and purchase one of his light and beautiful lawn mowers. The ponderous old fashioned machines are now wholly superceded by something much lighter and more efficient.

—Gentlemen about fitting up their new offices, and all housekeepers, and hotel proprietors who are putting their houses in order for the season will find the best of furniture at the well-known house of De Graaf & Taylor. See advertisement in another column.

THE AMERICAN MUSEUM OF NATURAL HISTORY.

THE grand project that was culminated in the institution now near completion west of the Park, was first hinted at eight or nine years ago at a meeting of some of our most prominent and liberal hearted citizens. The want of an institution founded upon a liberal basis and for the good of the masses has long been felt, and the season was ripe for its projection. John David Wolfe was chosen President of the "founders," and a charter having been obtained through the recommendation of thousands of citizens, the American Museum assumed a palpable shape. The charter was followed by an act that provided five hundred thousand dollars ($500,000) for the erection of a suitable building, which was in time to be followed by other wings as the collections grew in size and value, until at the completion, the museum building alone will represent ten millions of dollars, and will cover the entire area of Manhattan Square, lying betwen 77th and 81st streets on 8th avenue. The corner stone was laid in June 1873 by Pres. Grant, and since then the immense structure has assumed the towering proportions that mark it as the fiucst and most prominent building in the upper part of the city.

The one great object was to have it fire-proof, and every move in its construction has been to that end, and at its completion there will be absolutely nothing about the building that would burn even if exposed to fire. In length it exceeds two hundred and twenty feet, and sixty feet in width, while the walls are five feet in thickness, and evidently made as well for the future as the present. The basement will be reserved for the heavy work of taxidermy, etc., it being connected with the halls above by a passenger and freight elevator of the newest construction. The cases (one of which is now on exhibition at the Arsenal) will be composed of metal, and stone foundation; the shelves even being of plate glass. In shape they are similar to those now in use, except, that they swell on the interior end, an economy that not only gives more space for specimens, but tends to form an enclosed room between the cases, which with the help of a curtain can be made perfectly private to the student or scientist. The middle of the great halls will be utilized by the presence of desk cases to contain special geological specimens, and others that require close attention and study. The fifth floor is devoted to a purpose that has been the object of the museum since its start, *viz.*: the perfect accommodation of students in any and every branch of Natural History. On this floor, on either side of the gallery are fourteen or fifteen large and well lighted rooms, each representing a separate department of this interesting study. In the first room devoted to geology, the student will find not only an exhaustive library, covering all branches of the science, but a complete set of duplicates for study and work; instruments, glasses, and all the necessaries for study and the advice of a competent curator. In the chemical room, instruments complete, and library will be found, and so in every room everything will be found to make easy the resuscitation of hidden lore. Such is the purpose of the institution, and when it is understood that it is all free and for the benefit of all, and especially for those who cannot afford the expense of a scientific course it must be confessed that the cause is a noble one, and worthy our great city. Already great advances have been made in perfecting these arrangements. The old Arsenal is overflowing with thousands of specimens that cannot be replaced.

The great Jay collection of shells are almost in preparation to move, and the magnificent library cannot be equalled in the world. With this, is found a very complete general library of scientific and Natural History works that is being added to almost daily, and will be kept perfect as near as possible. Up to date, Robt. L. Stuart, the present President of the Museum, has recently purchased the valuable Ichthyological library of Mr. J. Carson Brevoort, and presented it to the Museum with the assurrance that he will complete it to the present standard of knowledge. A gift that greatly increases the value of the collection of fishes, and places it at once upon a standard of usefulness.
